1911

THE BUILDER

AN : ILLUSTRATED : WEEKLY
MAGAZINE : FOR : THE
ARCHITECT : ENGINEER : AR-
CHÆOLOGIST : CONSTRUCTOR :
SANITARY-REFORMER : AND
ART-LOVER.

"EVERY man's proper mansion-house, and home, being the theater of his hospitality, the seat of self-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kind of private principedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."—SIR HENRY WOTTON.

"OUR English word To BUILD is the Anglo-Saxon Bylsan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."—DIVERSIONS OF PURLEY.

"ALWAYS be ready to speak your mind, and a base man will avoid you."—WILLIAM BLAKE.

OFFICE: CATHERINE-ST. STRAND: LONDON: W.C.

FRAGMENTARY OLD PAINTED GLASS: ITS DUE TREATMENT.

WHEN the restoration of an ancient church is taken in hand, assuming that it has not been dealt with, except by way of occasional repair, for the last 350 years or thereabouts, it is often found that every window exhibits bits, more or less fragmentary, of stained and painted glass of a date prior to the first year of Edward VI., and it must be a rare case indeed when the windows show no remains of old glass.

Speaking, by way of example, of the smaller parish churches, some such arrangement as this is very usual. In the great east window are one or more

figures, often mutilated, of Our Lady or some of the Saints. Sometimes it has been an Annunciation window—Our Lady is there with hands held up in token of wonder, but the Archangel Gabriel, formerly by her side, has wholly or in part disappeared, while, in other cases, the Archangel is there and Our Lady has gone. In other instances a Crucifixion has been in the east window, and there may be left the cross or part of it, with fragments, here and there of the sacred Figure and of Our Lady and St. John on either side and St. Mary Magdalene behind. If there be side chapels, their east windows may show

remains of the coat-armour of those who built them, placed there as mute beseechings for prayers for their souls. The nave or aisle windows on the north side may have remains in their main lights of figures of the Prophets and Evangelists, while on the south side, in the main lights, will be fragments of the Apostles and Saints. The tracery lights will contain small figures of angels, Cherubim or Seraphim or Saints. The west window, if there be one, will usually show fragments of a picture of the Last Judgment, while in all the windows are seen remains of borders—conventional leaves, ostrich feathers, or lions' heads,

Fig. 1. Fragmentary Glass in Sheering Church, Essex.

maybe, in brown outline heightened with yellow, alternating with pieces of ruby or blue glass—and of quarries decorated with little designs, maple or oak leaf, ivy or vine perhaps, in which the pictures have been set.

The important point is that all these fragments of the old picture windows are, in such a case as we have assumed, the first restoration in modern times of an ancient church, found to-day *in situ*. They are in the positions in which they were originally placed, and, as is evident, they constitute, even in their fragmentary condition, most valuable evidence of the former condition of the church in the matter of window glazing.

The reason for this state of things seems to be that, contrary to popular notions, there was comparatively little violence done to painted church windows in the troublous days of the XVIth and XVIIth centuries. Such violence as there was was probably, so far as secular churches were concerned, chiefly directed against cathedral and collegiate churches, the greater number of which, being in the larger cities and towns, were more exposed to mob violence than country churches. In most places it is probable that the old picture windows were simply left to decay, clear glass being inserted as the pieces of coloured stuff bit by bit fell out of their settings or were accidentally broken. This would seem to be the tale told by the fragmentary painted glass which has survived to our time, even were other testimony lacking. Fortunately, however, we have contemporary evidence on the subject. Harrison, in his "Description of England," prefixed to "Holmes's Chronicle" (Bk. II., ch. 4, p. 223), after referring to the removal and defacement

of images and other "monuments of idolatry," says, "Onlie the stories in glasse windowes excepted, which, for want of sufficient store of new stuffe, and by reason of extreame charge that should grow by the alteration of the same into white panes throughout the realme, are not altogether abolished in most places at once, but by little and little suffered to decaie that white glass may be set up in their rooms." If this statement is reliable, and we know no reason for doubting it, we have a complete explanation of the state to-day of the window glass of our ancient parish churches prior to restoration. Given a set of church windows in the condition which we have pictured, surely, having regard to the high value which such an arrangement has as well for the art student, the architect, and glass painter as for the student of history, ecclesiology, heraldry, and allied subjects, one should study to preserve such a record and to extract from it means whereby the windows of the church, when restored, shall serve the same ends and teach the same lessons as they did of old when filled with painted glass. This notion is in accordance with the idea which is supposed to prompt church restoration nowadays, namely, how to make a church answer the same purposes—worship, sacrifice, prayer, and teaching combined with appreciation of what is fitting in external things—as it was originally meant to serve.

If these be, indeed, the objects to be aimed at in church restoration, how do we stand with regard to the old windows? Have we hitherto dealt with them in a manner helpful towards a restoration of their usefulness and beauty?

In most cases we have not done so.

Whatever the cause may be—thoughtlessness, misapprehension as to the true use of painted glass, monetary considerations, or what not—the lamentable fact is that most people have got to look upon fragmentary old glass as of no practical value, and while out of deference to a half-apprehended notion that it must not be destroyed, but in some way or other preserved, they have not the courage to throw it aside, they do with it what is almost as bad by removing it from its setting, cutting it up into convenient shapes, and leading it all up together into a composite mass of coloured glass. Thus these precious fragments, which if left *in situ* would have served as a key for reconstruction of the old picture windows, are rendered useless, and the only result of such well-meant efforts to preserve old fragmentary glass is to make a "jumble window," a thing dazzling and confusing to the eye, without beauty or teaching capacity, and of no earthly use to anybody. To take a few examples. Why was the fragmentary tabernacle work which formerly stood *in situ* in one of the windows of Sheering Church in Essex, and which might have been a guide in reconstructing a window as nearly as possible similar to itself when new, stuck all together, some pieces sideways, others upside down, mixed up with broken pieces out of other windows, and finally fixed in the head of the south chancel window? Fig. 1 shows this modern example of what not to do with fragmentary old glass.

Again, why did the person responsible for repair of the old glass at Netteswell Church near Harlow perpetrate so ridiculous an anachronism as to tack on to the under part of an ox the lower

Fig. 2. Symbol of S. Luke in North Nave Window, Netteswell, Harlow, Essex.

part of a draped human figure (Fig. 2)? This was, in the circumstances, inexcusable, for a very little study of the fragments in other windows would have shown that the drapery was part of a broken figure belonging to a set (originally four) of which two are still in the tracery of the window opposite to that in which the ox occurs. The arrangement is, two perpendicular side windows facing each other with four tracery compartments in each. In the north window tracery are the symbols of the four Evangelists, among them the ox in question, and on the south are the two figures shown in Fig. 3. No doubt the fragment leaded on to the ox is the lower part of one of the two otherwise lost figures—either Our Lady or St. Mary Magdalene, for it is likely that the four Marys were originally in these tracery lights. Netteswell, too, reminds us that in the head of the south chancel window there are many fragments leaded together haphazard fashion which, had they been left in their original positions, might have enabled us to reconstruct the windows referred to in the *Gentleman's Magazine* (1796, I. 380) as "pictures of two or three of our Kings." Probably these Kings were Sainted Kings, the Edwards and St. Edmund the Martyr.

A jumble window is bad in itself, but it is worse by reason of the fact that it does not completely answer the intentions of those who have caused it to be made. No doubt their purpose is to carefully preserve, in the sense of *not to destroy*, the fragmentary old glass, but their

agent, the glazier, has one object only in view, viz., how to make the fragments fit in with one another and how to make the whole composition, when leaded up, go into the window opening where he is to fix it. The result, of course, is that the fragments are made more fragmentary still, and some actual waste is inevitable. All jumble windows give evidence of this wasteful process—here a piece cut off a letter, there an essential part of a design shorn away. An apt illustration is the quarry from a jumble window in the Lethieullier Chapel at Little Ilford (church, Essex (Fig. 4). This quarry, once rectangular, bearing "the crown in the thorn bush" badge of Henry VII., with his initials H.R. below the badge, has been cut to make it fit into a circular window, and in the cutting the H. has been taken off.

But what is the alternative to the "jumble window"?

True restoration is, first of all and all along, conservation, and so we think that whatever else we do we should preserve such evidence as has survived of the original plan of decoration of each window. If, further, we can restore it to what it was up to the days of Edward VI., thereby renewing its teaching capacity, we shall do well.

Some such plan as the following might be carried out:—

As a preliminary step, each window should be examined at close quarters to see whether any remains of painting,

not visible from the floor level, are still discernible. Any work so brought to light might be strengthened with water-colour mixed with gum-water. This would adhere to the glass and could be washed out afterwards. In this connexion we may mention that it is a common occurrence to find that the lines of faded work, of the existence of which there had been no suspicion when standing on the floor of the church, can upon close inspection be seen.

Accurate tracings might then be made of every window, and from these full-sized coloured drawings could be made for preservation among the parish archives.

An attempt might next be made, working on tracing paper stretched over the original tracing, to reconstruct the window. Of course, if the fragments are so slight as to offer but little guide to the run of the original design, the painter would have to apply his knowledge of ancient art, aided by careful comparison with the other windows of the church and, if possible, those of neighbouring churches, in the reconstructive, or rather semi-creative, process. In many cases, however, little difficulty would be experienced in reproducing the old design from its existing fragments.

The reconstruction accomplished on tracing paper, is the window to be in reality a new one with the old fragments merely leaded in and lost among the new pieces of glass? Emphatically no.

Fig. 3. SS. Mary Cleopha and Mary Salome in Tracery of South Window of Nave, Netteswell, Harlow, Essex.

The fragments ought still to be clearly distinguishable from the reconstructed portion. To this end we would suggest that the fragments, while their exact places in the window are preserved, should be set in sheets of clear white glass, which should fill up the entire window except where the fragments occur. Upon this clear glass the reconstructed parts might be painted in oil colours mixed with amber medium, the leading being indicated by thick black lines. Thus, to a spectator from within the church, while the ancient portion would be easily distinguishable from the new, the whole design would appear as one, and it would depend for its effect upon the knowledge and skill of the man who drew the reconstructed portions.

In the course of time, when criticism had done its work and the reconstruction was finally approved, the sheet glass might be removed, and the reconstructed portions painted in glass colours and leaded up with the fragments in the usual way. Even then, however, the old part should be distinguished in some way from the new, perhaps by the lead round them being gilded. The art student and the antiquary would then, at all times, be able to tell the old work from the new.

For practical demonstration, and by way of suggestion only, an attempt has been made (Fig. 5) partially to reconstruct a piece of XVth-century glass, believed to represent St. Edmund of Canterbury, in the south chancel window of Roding Abbess Church, Essex, and to give the result (Fig. 6). This is, of course, a case where the original positions of the fragments cannot now be exactly ascertained, the run of the design having been lost in 1866 when the existing jumble was made, and it is not, therefore, quite an apposite illustration to our argument, which has been mainly concerned with *unrestored* windows. Still, it may serve

to make our suggestions clearer than they would be without it. We might add that we have confined our remarks to the lower and principal part of this glass. There is a great deal of confused tabernacle work, not shown in the illustrations, over the figure, which we have not attempted to reconstruct, and, with regard to the inscriptions on the scrolls, we have suggested a verse from the sixth Psalm which fits in with the fragments *dne* and *quo*; but we are quite ready

of expense might, in many cases, militate against its adoption. We admit the validity of the objection where money is scarce, and we cannot but think that the proper course in that event is simply to leave the fragments alone, taking care only to re-lead and strengthen the settings where necessary. At a future time, and as funds permit, the reconstructive process might be carried out.

Again, it often happens that a fragmentary ancient window is removed to make way for a modern memorial window. How much better would it be to reconstruct the old glass—a not more expensive process than the designing and making of a new window—and thereby not only to set up a worthy memorial to a departed soul, but to restore a lost feature to the fabric of the church!

NOTES.

A Ministry of Fine Arts.

A SHORT time back we dealt with the obvious necessity for a Minister of Fine Arts, in view of the numerous occasions that arise in which reliable artistic advice should be at the disposal of the Government and other authorities, and we cannot but welcome the action taken by the *Daily Graphic* in obtaining the opinion of some of our leading artists on the desirability of forming a permanent advisory committee of artists in connexion with a Ministry of Fine Arts. Whenever any scheme arises involving one or more of the arts it almost invariably drifts into a state of confusion from which it only emerges after a series of unseemly wrangles in a mutilated and abortive form. Thus all our attempts to secure an adequate artistic expression for our patriotic and national aspirations are nullified by the lack of competent direction at the initiatory stages. This is mainly due to the fact that no provision is made to ensure that those whose

Fig. 4. Quarry at Little Ilford.

to stand corrected on that point, and, indeed, on the whole attempt at reconstruction. We do, however, suggest that nothing in Fig. 6 is incongruous to the ancient fragments, and that, on the whole, it constitutes a more useful and teachable picture than the patched-up design in Fig. 5.

No doubt it may be objected that such a plan for dealing with fragmentary old glass as we have ventured to put forward is in the nature of a counsel of perfection, and that considerations

Fig. 6. Suggested Reconstruction.

opinion is of real value are consulted, and decisions of the highest artistic importance are left to quite unqualified authorities, elected or appointed to perform services utterly different in character. We need not quote instances, they are present in the minds of all, and form the most conclusive arguments in favour of some form of artistic authority not merely critical in its functions, but also charged with the duty of organising the methods to be adopted in the realisation of all important proposals having an æsthetic intention.

St. Paul's Bridge. WE are glad to be able to congratulate the City Corporation on taking the reasonable course of consulting Sir William Emerson, Mr. T. E. Colcutt, and Mr. J. J. Burnet to advise them as to their future course of action in dealing with a town-planning scheme of such unusual architectural interest and importance. We presume these gentlemen are to be asked for their independent advice on the whole situation. A delicate and most responsible duty is placed upon them, in the right discharge of which they will, we are sure, receive the whole-hearted support of the profession. In such matters as this a public authority is often in the position of needing someone to advise them how and where to obtain advice, what steps to take to ensure that the work they have in hand is entrusted to those who are specially qualified to undertake it. We are confident that everyone can rely on the public spirit and fearless independence of the gentlemen selected, and that, realising the gravity and the magnitude of the issues involved, they can be relied on to advise the course of action they honestly believe to be in the best interests of architecture and to the credit and ultimate renown of the City of London.

St. Paul's Bridge and Continental Methods. It has always been understood that the former Chairman of the Bridge House Estates Committee announced the intention of his Committee to advise the Corporation to institute a competition for St. Paul's Bridge. We hope this intention has not been abandoned, as the question is essentially a public one, appealing to the imagination and public spirit of all architects or town planners. Nothing but good can possibly arise from enlisting the active sympathy and interest of all those who have given any thought to the matter, or from collecting the best ideas on the subject; for these do not always occur just at the right moment to the most gifted of individuals or the most competent of permanent officials. Particularly is it necessary to obtain the ideas of the younger generation, for, by reason of their superior education in monumental planning, the most able monumental designers should, if education counts for anything, be found in their ranks. Without a competition these ideas may never see the light. If we are to obtain such satisfactory results as are to be seen in many Continental capitals we cannot do better than emulate, not only their combined enthusiasm and breadth of view, but also their better methods of procedure, as seen, for instance, in the methods

adopted by the Municipality of Vienna in dealing with the problem of the layout of the Karlsplatz. Not only was a competition held in which awards were made to Dr. Stiibben, Dr. Otto Wagner, Professor Meyreder, and Professor Back, in conjunction with an engineer, but official designs were afterwards made by Professor Meyreder and then further studied for modifications by Dr. Otto Wagner and Professors Ohmann and Goldemund. The procedure here adopted to obtain the best results is most striking. First of all, the importance of the matter is fully recognised by those responsible. Nothing is considered final while improvement is possible, neither time nor expense is spared. A system obtains whereby the best minds can be brought to bear on the subject and to contribute ideas to the common fund. Every one seems willing to work loyally together and to be perfectly ready to abandon or modify his own ideas in face of better ones, to subordinate his own personal interests and opinions for the common good of the community, so as to obtain by combined effort a finer result than any one man alone would be likely to achieve. That is what is wanted here. We have no doubt whatever that architects in this country would be capable of the same disinterested and public spirited action if they were appealed to in the right way. We would again most emphatically point out that the public interest demands that the best available talent be employed in the public service, whether it be secured by means of a competition or not.

The R.I.B.A. Address to the King.

THE R.I.B.A. illustrates in the *Journal* the address presented to his Majesty on the occasion of the Coronation. Designed and executed by Mr. Graily Hewitt and Mr. L. Macdonald Gill, the whole is conceived in a thoroughly decorative spirit. The first page displays the Royal arms on a banner laced to two shepherds' crooks, over the centre of this appears the Royal Crown, and above is a shrine enclosing a crown of thorns. The only feature to which we think exception might be taken is the inclusion of the upper stage of the two Westminster Abbey towers on either side of the shrine; they are hardly in scale, and, if intended to suggest that the Abbey front lies behind the banner, are not in correct relationship to each other. The design would have been better had these been omitted. The form and distribution of the lettering in the address itself are deserving of the highest praise.

Our New Stamps.

THE new issue of postage stamps marks another downward step in the quality of what may be termed official art. Apart from the lack of character in the portrait, the design of the enclosing frame is even feebler than in the stamps of Edward VII. The effect of the penny stamp is confused by the lack of symmetry in the lion, which is both out of scale with the wreath, and forms an unsatisfactory starting-point for it, while the attempt at a cartouche in the half-penny stamp is simply lamentable in its lack of decorative firmness and its ragged outline. We may admit a certain quality of draughtsmanship in the penny stamp, but the halfpenny touches the lowest

ebb of ineptitude in design. We may sincerely wish King George V. a long and prosperous reign without desiring any but the shortest life for the stamps that have been prepared to mark his Majesty's Coronation.

Bedford College for Women.

THE governing body have just secured a ninety-nine years' lease of the site and grounds, about 10 acres, of South Villa, Inner Circle, Regent's Park, at a cost of some 18,000*l.*, and propose to expend from 70,000*l.* to 80,000*l.* upon the erection of new buildings after plans and designs which have been prepared by Mr. Basil Champneys; the library, a gift of Lady Tate, will be planned by Mr. Sidney R. J. Smith. South Villa, whose grounds extend to the margin of the lake, was opened two years ago as an additional residence for students of the College in York-place, Baker-street. It was the home of George Bishop, F.R.S., who, in 1837, built the observatory there in which, in 1847-54, Dr. Hind made his renowned observations of the asteroids and discovered ten new planets. About thirty years ago the owner of South Villa obtained a fresh lease from the Crown and spent more than 50,000*l.* upon a general improvement of the property.

Rembrandt's Homes in Amsterdam.

AN exhibition of drawings and etchings by Rembrandt is opened in the house No. 4, St. Antonies Bréestraat, to celebrate its dedication as a museum and library in commemoration of the great artist who lived there in the days of his prosperity, and quitted it in 1658 for humbler quarters in the Rozengracht. The house, which had been subdivided into two and otherwise maltreated, was rescued five years ago at the instance of Joseph Israels and J. P. Hartsen, and, having been acquired from the Municipality, was restored as far as possible to its pristine state under the architect Bazel's directions and superintendence. In the course of the work it was found that the original stepped gable, of 1606, had been removed for the existing one with cornice and pediment, and that the house had begun to lean over. The inventory made in 1656 of Rembrandt's effects has availed as a guide, to some extent, in the reinstatement of the interior apartments, and the arrangement of the exemplars of his work. The later house, wherein he passed the close of his life, is entirely modernised for trade purposes.

Exhibition of Egyptian Antiquities.

THE annual exhibition of the British School of Archaeology, which is at present being held at University College, is of unusual variety and interest. The work accomplished by Professor Petrie and his assistants during the past session has been prolific in its results. The sites of the excavations, Haward, Meydum, and Memphis, were all within 50 miles of Cairo, Professor Petrie having undertaken the charge of the first named (one of his old exploring grounds), while operations at the other places were carried on by Mr. Wainwright and Mr. Mackay. In continuation of his work of 1888 on the same site Professor Petrie has unearthed from the cemetery at Haward a large number

of Roman portraits of the greatest interest, dating from A.D. 100—250. Not more than one per cent. of the mummies buried at Haward had portraits, so that this branch of the undertaking business seems to have been limited to the more well-to-do class. The custom appears to have been, not to bury the mummies with the portraits, but to place them in the colonnade around the atrium of the private dwellings, until such time that the mummy cases fell into disrepair or a generation succeeded in whom the portraits awakened no sentimental or family interest, and then they were relegated in groups to a pit in the burial grounds. Notwithstanding the character of this custom, the portraits possess considerable artistic quality. They carry the conviction of individuality and likeness, and they are carefully painted. They are in a wonderful state of preservation, and altogether provide an interesting commentary on Roman painting of the time. In addition to the portraits the exhibition includes some examples of gilt cartonnage heads from mummies of earlier date, and some specimens of elaborate mummy wrapping; in one case the folds are thirteen layers deep, in rhombic pattern, in blue, red, white, and gold. In other cases, the mummy cloths, which have been unfolded, are of considerable decorative interest. There are a large number of smaller objects, such as scarabs, beads, gold rings, imitation gems of coloured glass, toys, and so on, as well as objects of domestic service of ware and other materials. Decorative slabs, inscriptions of various dates, and pieces of sculpture (including a limestone head of life size with the eyes filled with white glass) go to form one of the most interesting exhibitions which the School has provided of late years.

The Institute Medal of the Institute Gold Medal.

The award of the Gold Medal of the Institute year by year with unfailing regularity appears to assume that there will be an equally unfailing supply of recipients of outstanding merit, of real distinction, to maintain the traditions of a roll on of which are inscribed such names as Viollet-le-duc, Charles Garnier, Cockerell, and Barry. But Nature unfortunately cannot always be relied upon to accommodate her inflexible laws to those of the Institute, and to produce the man of distinction with the regularity required. Such an honour as this loses its value if it becomes a matter of routine, and is looked upon as one which, in the ordinary course of promotion, should crown a successful but blameless career. While the Institute continues to keep a watchful eye over the whole field of foreign architecture, archaeology, and letters there is hope that—as in the case of Dr. Wilhelm Dörpfeld—the necessary man of distinction will be discovered. When we consider how small a proportion of the civilised inhabitants of the globe are so fortunate as to dwell in these diminutive islands we realise how exceptionally gifted we must have been to supply forty-three out of a total of sixty-three distinguished recipients of the medal; unless we are to presume that it has sometimes been awarded more as an encouragement than as a reward. Should

there be any sign in the future of the failure of the home supply of men of distinction the Institute might perhaps reconsider their present method of awarding the medal by a system of rotation.

ANNUAL DINNER.

The annual dinner of the Royal Institute of British Architects was held at the Fishmongers' Hall, Adelaide-place, London Bridge, on Tuesday, when a large and distinguished number of architects and guests assembled. The President, Mr. Leonard Stokes, presided, and there were present amongst others:—

Mr. John G. Abraham	Mrs. Hornblower
Mr. John W. Abraham	Mr. Edgar Horne, M.P.
Mrs. John W. Abraham	Mr. Gerald Horsley
Mr. Maurice B. Adams	Mr. George Hubbard, F.S.A.
Sir Lawrence Alma-Tadema, O.M., R.A.	Mrs. Hubbard
Mr. L. A. Asherley	Mr. John Hudson
Joncs, K.C., M.P.	Mrs. Hudson
Mr. Maxwell Ayrton	Mr. John Hunt
Mr. F. G. Baker	Mrs. Hunt
Sir Thomas Barlow, Bart., K.C.V.O.	The Very Rev. Professor Inge, D.D.
Mr. Douglas C. T. Bartley	Mr. T. E. Lidiard James
Mr. Walter C. Beutles	Mr. W. Goscombe John, R.A.
Mr. G. E. Bond	Mrs. Goscombe John
Mr. C. W. Bowles	Mr. Alderman Sir Charles Johnston
Sir Thomas Brook, K.C.B., R.A.	Mr. W. G. Keith
Sir Henry Buckingham	Mr. J. P. Lassen
Mr. John J. Burnet, A.R.S.A.	Sir Charles Lawson-Witterwonge, Bart.
Sir Edward H. Busk, M.A.	Mr. Sydney E. Letia
Mr. C. MacArthur	Mr. W. J. H. Leverton
Mr. J. Dixon Butler	Sir James Linton, P.R.I.
Sir Henry T. Butlin, Bart.	The Right Hon. the Lord Mayor of London
Mr. Henry C. Charlewood	Mr. Edwin L. Lutyens
Mr. Christian Christensen	Mr. Ian MacAlister, Secretary, R.I.B.A.
Mr. Edgar F. Church	Mrs. Ian MacAlister
Mr. Harold E. Church	Mr. J. Y. MacAlister
Mr. H. Chatefield Clarke	Mr. Fred W. Marks
Mr. Max Clarke	Mr. R. W. May
Mr. T. Costigan	Mr. Stanley J. May
Mr. S. Forrest Cowell	Mr. H. A. Miers, F.R.S.
Mr. J. D. Crace	Mr. Alfred Moor-Radford
Mrs. Crace	Mr. Philip Morrell, M.P.
Mr. Richard Creed	Sir Henry Morris, Bart.
Mr. Richard Creed, jun.	Mr. John Murray
Miss Creed	Mr. Fred W. Marks
Mr. T. Harrison Dakin	Mr. E. Turner Powell
Dr. W. Morrison Davies	Sir Edward Poynter, Bart., P.R.A.
Mr. T. Raffles Davison	Mr. Andrew N. Prentice
Mr. Frank Dicksee	Mr. Richard M. Roe
Lady Emerson	Mrs. Roe
Mr. Rudolf Dircks	Mr. P. P. Rowell
Mr. J. W. Domoney	Mr. Joseph Sawyer
Sir William Emerson	The Right Hon. the Lord Saye and Sele
Mr. C. W. English	Mr. W. H. Seth-Smith
Mr. Frederic R. Farrow	Mr. Herbert Shepherd
Mr. W. Fleming	Sir Frank Short, R.A.
Mr. William Flockhart	Mr. John W. Simpson
Mr. Frank Fox	Sir John Slater
Mr. Percival M. Fraser	Mrs. Slater
Sir Ernest George, A.R.A.	Mr. Marion H. Spielmans
Mr. James S. Gibson	Mr. Leonard Stokes
Mrs. Gibson	Mrs. Leonard Stokes
Mr. G. Bird Godson	Mr. Basil M. Sullivan
Sir Laurence Gomme, F.S.A.	Mr. J. Sylvester Sullivan
Mr. Edward Greenop	Mr. F. Swanzy
Mrs. Edward Greenop	Mr. C. Tanner
Mr. Stanley Hamp	Mrs. W. H. Harrison
Mr. Henry T. Hars	Mrs. W. A. Hawes
Mr. G. Lovell Harrison	Sir Charles Henry, Bart., M.P.
Mrs. G. Lovell Harrison	Mr. Lewis Hind
Mr. W. H. Harrison	Miss Florence Hobson
Mrs. W. H. Harrison	Mr. James S. Holliday
Mr. W. A. Hawes	Mr. George Hornblower
Sir Charles Henry, Bart., M.P.	
Mr. Lewis Hind	
Miss Florence Hobson	
Mr. James S. Holliday	
Mr. George Hornblower	

His Grace the Lord Archbishop of Westminster
 Mr. Thomas B. Whinney
 Mr. A. G. White
 Mr. Edward White
 Mr. J. G. White
 Mr. W. Henry White
 Mrs. W. Henry White
 Mrs. Clyde Young

The loyal toasts having been proposed by the President and honoured,

Mr. H. A. Miers, F.R.S.,

Principal of the University of London, in proposing the toast of "Architecture and the Sister Arts," said he assumed that he had been called upon to propose the toast because he knew nothing about architecture—of the practice or purpose of architecture—or of the sister arts. Most people would wish to be artists even if they had not been born with the taste or desire, and he could say that from his earliest days he had taken an interest in architecture, and one of his earliest escapades was, after reading Parker's Glossary, to run away from school with a comrade to study the architecture of Ilfley Church. He could claim that the tender influences of the art had been acutely felt by him in his later life, for no one who had spent five years under the engrossing influence of Elton, three years at Oxford as a student, and thirteen years afterwards as a Professor, without realising what an important part architecture plays and must play in the education of one whose early life is passed in contact with some of its most beautiful examples. The traditions and inspiration of both Oxford and Cambridge were largely due to the fact that they possessed these beautiful old buildings. There was a passage in the autobiography of John Stuart Mill where he explains how, when a boy, living amid sordid surroundings, with nothing to inspire him in the buildings in which he lived, great was the effect upon him of a visit to the Bentham at Ford Abbey, among historic and romantic surroundings; and, he wrote, these fine old buildings gave him a freer existence. Coming from Oxford to London, he (the speaker) had felt not so much the inspiring influence of architecture as its deplorable absence. He called to mind the visit some time ago of a German professor, who was sent to report on the buildings in England which seemed to represent an idea, which were the expression of a dream—some historical fact or faith which stood for something to the people. Coming from Oxford to London he found this great difference—whereas in Oxford there were buildings which stood for ideas and tradition, he was ashamed, in coming to London, to find that the University city which had no buildings that it could call its University, no central hall or residence; and if London could ever, with the help of some generous benefactor, and with the assistance of some great sculptor and painter, erect a fine work of architecture which would stand for the academic idea—be the visible expression of the University—then they would have performed a great service to London. Only once had he met a London cabman who professed to know where the University of London was, and that man said, "It is somewhere in Hoxton, sir, or is it Holloway?" There was, it seemed, some confusion in the cabman's mind between the University and the Union. If that was so, it was because not only was there no University building in London, but because architecture had run riot, and had produced buildings intended for unions which could be mistaken for Universities. The attempt was being made in one part of London, owing to the enterprising of Professor Geddes, to give Crosby Hall something like an academic surroundings, and something in the nature of University character. Until he came into the building that evening he did not know what were the sister arts, but he had little doubt that sculpture was one. In coming to London he had been impressed, again, with the want of alliance between architecture and sculpture—the sort of alliance that impressed the mind of those who study the ancient arts or visited Greece and saw what that alliance meant in the days of the best Greek art. The ordinary traveller who visited the sculpture galleries of Europe or the ruins of the fine buildings of Greece or Rome, failed to realise

what an important part sculpture played in those days—in the beauty and meaning that it conferred upon those buildings. Those who visited museums and saw sculpture torn from its surroundings and wrongly restored did not always understand the important part it played in the buildings. He hoped that this association in the toast of the two arts of sculpture and architecture meant that we realise the need of a close union between the two. Those who visited the Continent and went to Dresden, for instance, and saw a headless statue there, and then went to Bologna and saw a bust labelled "Head of a Youth," failed to realise that together they made up the Athena Lemnia that once stood on the Acropolis. Many travellers missed the meaning of this association because the sculpture and architecture were not brought together. London was the only great city of the world which did not possess an adequate collection of casts from the antique. At Munich, Berlin, Copenhagen, and elsewhere were fine collections, but no so in London, though a beginning was being made, he was glad to say. As to painting, at the present moment there was an exhibition at the University of London which took one back to the beginnings of painting; he meant the extraordinary collection brought back from Egypt by Professor Flinders Petrie. He did not know what other arts were to be associated in this toast; perhaps the art of town planning, which now figured so largely in the public mind, could be included. The English were not to be regarded as an artistic nation, but the interest in town planning indicated a desire for artistic architecture to make our towns a systematic development of artistic buildings rather than a collection of structures thrown together in an haphazard way, as most of them were at the present time. We were endeavouring now to take steps to further architectural education in the University of London by combining what were now two small and scarcely adequate schools of architecture in the hope that we might make of them one large and strong school in which, he trusted, they would not only have the help of the Institute, but of the whole profession of architects. He hoped, before long, to be able to say that they were beginning to teach properly the subject of sculpture at the University of London. The toast was "Architecture and the Sister Arts"—the sister arts being the Three Graces that accompanied architecture throughout the world, or, from another point of view, the Three Fates which determined the careers of many of those assembled at that dinner.

Professor A. Beresford Pite, in responding for "Architecture," said that Professor Reginald Blomfield had designated architecture as the Mistress Art, and in his absence he would make no apology for the Academic use of the expression. He accepted with gratitude the compliment paid to them by the Principal of the University of London proposing the toast. It could not fail to be noticed by any keen observer that in the basis of a sound and completely organic system of architecture the great arts of painting and sculpture lived, moved, and had their being. We were living in an age of a high degree of specialisation of all forms of thought and action; painting had specialised in itself, and had come in to decorate frames; and sculpture had left the historic position it formerly occupied in the pediment and the frieze and was now isolated in various other ways in buildings. In the proper subordination of these arts to the Mistress Architecture they had their proper sphere. In the family of the arts—their proper application in the external and internal decoration of buildings which was necessary for their life and existence. In this proper subordination to the Mistress Art, something was done to restore the arts to that proper equilibrium which the proposer of the toast referred to when speaking of the great buildings for the University of London which he hoped to see erected one day. The Principal thought our buildings did not express artistic tradition, but we had artistic tradition as great as any artistic nation. There was a larger and deeper interest in the beauty of our cities at large than some of us were quite conscious of, and as an Institute of Architects they had a right to claim attention. Speaking in the presence of the Lord Mayor of London, he congratulated him on presiding over the

destinies of one of the most beautiful cities in the world. Within the area governed by the Lord Mayor and the distinguished Chairman of the London County Council were the Palaces of Greenwich, Somerset House, Waterloo and London Bridges, to say nothing of St. Paul's Cathedral, a crown of Renaissance building such as no other city possessed. What city was there in France or Germany which had such a collection of mediæval structures as the Tower of London, Westminster Hall, St. Bartholomew, Smithfield, the Temple Church, Southwark Cathedral, and, last of all, Westminster Abbey? Architecture in London was well served in the past. It was difficult to speak of the future. They were in the presence of those who were making the present we live in. Having alluded to the recent remarkable Town Planning Conference arranged by the R.I.B.A., the Professor said that the gathering together of men to consider the adequate treatment of buildings and their sanitary state and effect was a movement of the greatest importance, and he would suggest to the Principal of the University that town planning was architecture in its largest idea and most universal aspect. It was beautiful and touching to find that Parliament had recently conferred on the Corporation the honour of opening up and of exhibiting to the other side of the river and the world that lay beyond a view of St. Paul's Cathedral which would be unrivalled. He congratulated the Corporation on having secured the assistance of the three distinguished members of the Institute, in whose character and ability they had every confidence in regard to the new bridge, but the question was too large to be left only to them; it affected the dignity of the whole City and their appreciation of the greatest monument of the architectural art we possessed as a nation. It was a question which concerned all who valued this great wonder of architectural art. They possessed in the site upon Ludgate-hill and the river at its foot a situation which placed London in the position of beauty which was well worth their interest and demanded their greatest attention. They might hope that it would be successfully dealt with. He was not sanguine enough to believe that the solution was quite so near as they should like. It was complicated with many questions. It was complicated with the question of the safety of the dome; it was complicated with a number of intimate financial questions of which he must not venture to speak. But whatever the difficulties, whatever the responsibility might be, he was sure they would back the Corporation and support them in any scheme which was sufficiently large to do justice to St. Paul's Cathedral and to Sir Christopher Wren.

Sir E. J. Poynter, Bart., P.R.A., responded for "Painting," and said they had done him the honour of calling upon him to reply for "Painting." He felt some difficulty in approaching a subject so vast, in view of the very brief limits which he should impose upon himself; for, short of a studied lecture, there was no way of dealing adequately with a topic so complicated and so questionable in its aspects. Nor did he know exactly how he should best return thanks for "Painting" as an abstract proposition. If the toast was intended as an expression of their kind wish for the prosperity of the art from a commercial point of view, he felt some regret at not being able to summon the ghost of his great predecessor, Sir Joshua, or one of his contemporaries to reply to it, for in the picture market they were now experiencing such a success as his (the speaker's) own contemporaries might well look upon with envy; nevertheless, for their good wishes, so far as they extended in this direction, he thanked them most heartily, not without a pious hope that they might be realised. As for that other success, the "succès d'estime," the success which, though less substantial, was no less a source of pride and encouragement, he might truly say that the English School had of late years gained it in a remarkable degree. In all the international exhibitions that had been held in the last twelve or fourteen years the English painters had, to say the least of it, shown themselves second to none, and notably at the present Exhibition at Rome, where, by common consent, the English section was acclaimed as the most distinguished feature of the Exhibition, and he ventured to say that

the English school of painters, if they would keep their own individuality and cultivate that love of beauty which had been its distinguishing characteristic from the days of Reynolds, Constable, and Turner, and others—he ventured to affirm that they had nothing to fear in any competition for honours in the world. But he had not forgotten that this toast, as well as that of "Sculpture," was associated with that of "Architecture," as was only right on an occasion when painting and sculpture were the guests of the distinguished Institute which was so hospitably entertaining them; nor did he forget that painting took its highest form and fulfilled its noblest function when used for the decoration of great works of architecture. It was the first use to which painting was put, and he might say that the majority of the greatest works of painting that the world had seen were produced for such a purpose, adding a lustre to ecclesiastical and public buildings and private palaces which frequently outshone the edifices which they adorned. When he mentioned the works of Michelangelo and Raphael in the Vatican, the paintings of Giotto in the Arena Chapel, of Oragna and Ghirlandajo in the Sala Terrena, of Pinturicchio in the Library at Siena, he merely touched at random on a few amongst the hundreds of examples which the combination of painting with architecture presented to them in Italy alone, and where, if the building would suffer by the loss of the paintings, it might with equal justice be said that the painter would never have risen to such heights but for the architecture, whose beauty he was called upon to enhance, for the treatment of great spaces in noble architectural surroundings led to the highest form of expression which the art of painting could achieve. He had frequently dwelt in this sense on the importance of giving opportunities of this kind to our painters. The mere fact that an artist felt himself to be working for something that should permanently appeal to the public, that he was doing something of national importance, was a stimulus to him to put forth his best efforts, to bring his intellectual and artistic faculties to their highest use. Such efforts were the best antidote to that loose method of work from nature which too often formed the staple of our exhibitions; and it was sincerely to be hoped, in the interests of art, that public spirit would not stop at the completion of the corridor in the House of Lords, which had proved such a success, but carry further the scheme of decoration originally proposed for the Houses of Parliament. But the association of painting with architecture had another field of the highest usefulness, in which architecture became the handmaid of the painter. He was hardly over-stating the case when he said that from the time of Giotto to that of Tintoretto there was not a painter in Italy who had not a thorough knowledge of architecture and did not understand its value as an adjunct to his compositions; indeed, everywhere, up to the middle of the XVIIIth century, there was hardly a figure painter who could not enrich his subjects with the splendour of architectural backgrounds and accessories. Those in this country who were capable of so doing at present might almost be counted on the fingers of both hands. This lamentable ignorance of a great and closely allied art was a serious handicap, both by the limit which it imposed on painters in the choice and treatment of their subjects, and by the still more lamentable failure to design correctly when they attempted anything of the kind. It was his hope that in the Royal Academy Schools a course of architecture might before long be imposed on our painter students, instead of its being left, as at present, to the student to take it up as a voluntary exercise.

Sir Charles Lawes-Wittewronge, President of the Royal Society of Sculptors, responded for Sculpture, and was understood to say that the alliance between the arts was much more of a pleasure to be associated in than to talk about. The Society he was connected with was quite a young Society, but they had been immediately recognised by the Board of Trade, and it became their duty to organise various exhibitions which had taken place, and especially the British Exhibition at Rome. The use of sculpture to decorate our buildings reacted in favour

of the school of sculptors, and he hoped that our sculptors in the future would be able to hold their own, and perhaps even surpass the contemporary schools of the world.

Sir Aston Webb, C.B., C.V.O., R.A.,

When proposed the toast of "The Houses of Parliament." He said it was usual on occasions of the kind to say that Parliament had little to do with matters of art, but he thought that in the last two or three years they had had more to do with questions of art than before. The House of Lords had dealt with several important art matters, including the decoration of their own building, and the House of Commons had just given an opinion on the subject. Another speaker then decided that art should be considered in such an important matter as throwing a bridge over the Thames at St. Paul's. He had been told by an M.P. that what the result of the debate on the question would be in the House of Commons no one knew until it was declared, and said that he thought it was the first time that the House of Commons had expressed a direct opinion on a question of art and being left entirely free to express their views. He thought that result was largely due to the persistence of the President. Another speaker said that the House of Commons had devoted a good deal of time to and which had interested architects very largely was as to housing and town planning. A gentleman asked him quite recently if a Bill on the subject had been passed, and if it would do any good and would enable him to pull down insanitary cottages, as in his parish there were a large number of cottages, the bedrooms of which had no windows, the only openings being 9 by 9 in the walls, filled up with a solid bit of glass. He (the speaker) replied that it was a splendid measure, and the more it was used the more that would be realised. It was on these lines that the Houses of Parliament could assist them in their art work. They all knew that the Houses of Parliament could not provide a design, nor the Cabinet Council, or the Parliamentary Committee, or even their own Institute as an Institute; but what all these public bodies could do, and he was glad to say, were doing, was to see that when great public schemes were brought forward that they were placed before those who could and would fill in the scheme for them. It was on the lines of the Housing and Town Planning Act that so much could be done by the Legislature towards the good of our art and the people. If it was true, as they knew it was, that

righteousness exalted a nation, it was also true that bright and happy homes and beautiful surroundings would increase and multiply the happiness and brightness of the people of the country.

The Right Hon. Lord Saye and Sele having humorously responded for the House of Lords, and Mr. Edgar Horne, M.P., President of the Surveyors' Institution, for the House of Commons.

Mr. Paul Waterhouse

proposed the toast of "The Guests." In the course of his remarks he referred to the admirable manner in which the Lord Mayor was carrying out the duties of his office, and with the toast he coupled the names of Sir Vesey Strong and Dr. Bourne; the Lord Archbishop of Westminster. In speaking of the Church which Dr. Bourne represented, he said there were many architects who had worked for that Church in this country, but two names stood out in his (the speaker's) mind, and they were the last names he mentioned. The first was the name of Henry Pugin and the great period of fifty years. Pugin at the beginning and the architect of the Westminster Cathedral at the end. Both of those men showed in a conspicuous way how a man's art could be wrapped up in his faith. Of Bentley it might almost be said that it was part of his fame that he was so little known. One could hardly imagine a man who worked so industriously and so successfully, who when his great work was done was almost as little known as the great builders of the Middle Ages. In concluding his remarks Mr. Waterhouse said they owed the success of the day to the permission of the Fishmongers' Company that they were allowed to dine in that stately hall, and all would wish to express their thanks to the Company for this privilege.

The Right Hon. the Lord Mayor,

in reply, said it was a great pleasure to meet the members of the profession, and to come into the citadel of architecture and learn from them.

His Grace the Lord Archbishop of ^{the} West-
minster

also replied, and said that he came into contact with the profession on the ecclesiastical side, and they had shown great magnanimity in inviting him to be present, because, dealing with a large and congested and not over-rich population, the greater part of his work consisted in trying to set up ecclesiastical buildings of the simplest possible character at the least possible expense, and he thought that his first interview with the many architects with whom he might claim friendship was the most

pleasurable of a series; he entertained great hopes and his friends entertained great hopes of possible things they might accomplish, and then later on he had the unpleasant task of trying to reconcile artistic conceptions with a very exiguous purse. He could not forget that he was continually living in the shadow of what was regarded, he believed, as the very masterpiece of modern English art, and he could not but feel that account, if at times he had to curb artistic aspirations, he could not be ungrateful to members of the profession, because of what we all owe to the late Mr. Bentley. It was the Christian Church which had offered to architects in every age the highest opportunities for exercising their skill, and they on their part had done more than anyone else to add majesty and dignity to the Divine worship. He was sure that the Church may have had every possible success in every department of their art, that they would never fail to find in religion the fullest and highest source of their artistic conceptions.

The proceedings then terminated.

ALTERATIONS AND ADDITIONS TO NORMAN COURT, SALISBURY.

THE plan reproduced shows the new portion in the black and the old hatched. The house and the estate, which belonged to the Baring family, was purchased some few years ago by Mr. Washington Singer for over 200,000*l*.

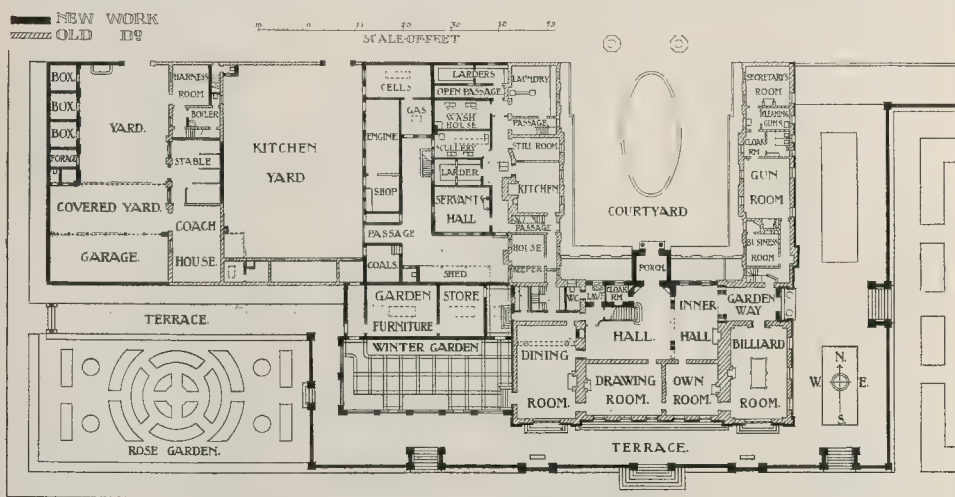

Both the interior and exterior have been entirely remodelled, and new terraces, winter garden, kitchen wing, stables, and garage have been added.

The works have been in progress for two and a half years, and the contract for the main block has been carried out by Messrs. Trollope & Colls, and other works by the estate workmen, from the designs of Mr. Sydney Tugwell, A.R.I.B.A., Mr. R. Manser acting as clerk of works.

GENERAL NEWS.

Professional Announcements.

Messrs. Hubbard & Moore announce that their partnership terminated on June 30, and that both Mr. Hubbard and Mr. Moore will continue to practise from their present address. 112, Fenchurch-street, E.C. - Messrs. Huskins & Mayell, architects and surveyors, have removed their offices from Bank-chambers, 76a, Westbourne-grove, W., to 124, Westbourne-grove, W., after being over thirty years at the first-named address.

Alterations to Norman Court, Salisbury. (*See also page 1.*)
Mr. Sydney Tugwell, A.R.I.B.A., Architect.

Oxford Encenia.

In the course of presentations for the honorary degree of D.C.L. at the Encenia on June 28, Dr. Warren, Professor of Poetry and President of Magdalen, introduced Mr. T. G. Jackson, R.A. (whom the Vice-Chancellor greeted with the salutation, "Artifex Oxoniensissime"), with the words, "Oxoniam antiquae repostor Oxoniae autem novae creator," and the Right Hon. Lewis Harcourt, formerly First Commissioner of Works, with the words, "Factaque sunt orbis quae prius urbis erant." The honorary degree of D.Sc. was also conferred upon Sir William Thiselton Dyer, formerly Director of Kew Gardens.

Oxford Union Society.

The new wing of the Oxford Union Society's buildings, which contains a large library, with writing, smoking, and billiard rooms facing the garden, and steward's house, was opened recently. The block was designed by the late W. E. Mills, A.R.I.B.A., since whose death in April last year the work has been completed by Mr. John Thorpe. The garden front is after the domestic Tudor style, and is built of brick with Clipsham stone dressings, and roofing of dark green Westmorland slate, and ridge and finials of stone.

A Congress of Hygiene.

The third International Congress for Sanitary Dwellings will be held in Dresden from October 2 to October 7. The first Congress was held in Paris in 1904, and the second in Geneva in 1906. The work of the next Congress has been divided into nine sections, namely:—

1. Town planning (building, forms of country settlement, garden cities, width of streets, height of building).
 2. Construction of buildings (planning, distribution of space, building material, foundations, basement, kitchens, lavatories, floors and ceilings, staircases, lifts and roofs).
 3. Internal arrangements (lighting, heating, ventilation, furnishing).
 4. Sanitation (cleaning, removal of refuse, disinfection).
 5. Town dwelling-houses.
 6. Country dwelling-houses.
 7. School buildings, boarding-schools, prisons, hotels, lodging houses, hospitals, convalescent homes, baths, churches, theatres, and other public buildings.
 8. Workrooms and workshops, means of communication and transit (railways, tramways, ships, vehicles, etc.).
 9. Legislation, executive, statistics, etc.
- Full particulars may be obtained from Dr. Hopf, the Kongresskanzlei des III. Internationalen Kongresses für Wohnungshygiene, Dresden, neues Rathaus, Zimmer 156.

Stoke Workhouse.

Under the direction of Messrs. Edwards & Shaw, consulting engineers, of Birmingham,

a water-softening plant and a centralised hot-water supply system have been installed in the Stoke Union Workhouse by the Brightside Foundry and Engineering Company. The water supply is obtained from three different sources, viz.:—The Potteries Waterworks Company, and two wells, each supply being of quite a different character to the others, but all containing a considerable quantity of incrustating material. To overcome the difficulty involved it was arranged to remove the scale-forming elements, and to centralise and operate the whole of the heating and domestic hot-water supply from one central source with a view to effecting the maximum economy in fuel and attendance.

Oxford University.

The new buildings for Oriol and Brasenose Colleges are nearly completed. The former, opposite to St. Mary's, have been erected in pursuance of the will of the late Mr. Cecil Rhodes, from designs by Mr. Basil Champneys, which preserve as much as was possible of the old quadrangle of St. Mary's Hall, originally the parsonage house granted in 1326 by Edward II. to his almoner, Adam de Brome, as endowment for the college. Nearly opposite, in High street, stand Mr. T. G. Jackson's latest additions to Brasenose College, which complete his work begun for the college some years ago—see our illustrations of June 4, 1887; August 4, 1888; and June 7, 1890—and form the new and larger quadrangle, which has supplanted the old tenements in Amsterdam-court (named

**Bungalow, Shanghai.**

Messrs. Scott, Christie, & Johnson, Architects.

after the ancient Amsterdam or Broadgates Hall), together with some timber and plaster buildings that served for undergraduates' rooms, and, as we understand, the site of the brew-house or brasinium of King Alfred's palace. This, the latest and south, side of the new buildings faces High-street, and stands between Lincoln College and Dean Aldrich's early XVIIIth-century church of All Saints, and the church of St. Mary the Virgin. The façade is after the "Collegiate Gothic" style with modified XVth-century Perpendicular details. The block is planned for the Principal's house and rooms for fellows and undergraduates, with a muniment-room in the upper story of the gate-tower, which is recessed from the main frontage line.

BUNGALOW AT SHANGHAI.

MR. W. SCOTT, A.R.I.B.A., MR. J. CHRISTIE, and MR. G. A. JOHNSON, A.R.I.B.A., have lately designed and carried out this work for Messrs. H. & T. Veitch. The house is designed on the bungalow type, the materials used being local bricks rendered with rough-cast, red-brick plinth, Singapore hardwood timber, Ningoo stone dressings, and red Marseilles tiles. The external woodwork was treated with Solignum, and the rough-cast tinted a cream colour. Some of the windows have lead lights, which were made in England.

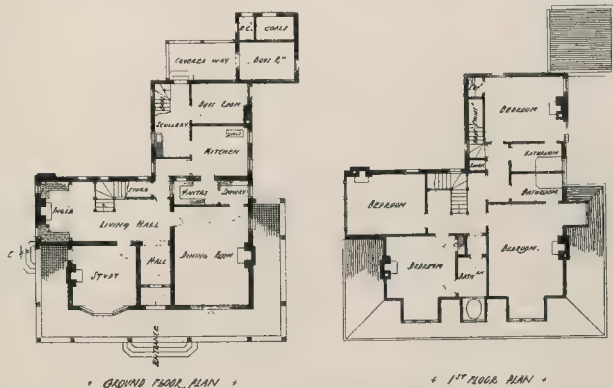

BOOKS.

The English Staircase. By WALTER H. GODFREY. With 65 colotype plates and other illustrations. (Batsford. 18s.)

THIS is a valuable contribution towards the history of architectural design in England. The author modestly disclaims any attempt at an exhaustive treatise; but the series of illustrations, comprising sixty-three plates and fifty-six illustrations in the text, is arranged chronologically, and of itself gives an excellent idea of the development of design in the important feature with which it deals.

So important must always have been the means of getting from one floor to another, that the tale which every young architect's relations inflict upon him of that other young architect, who designed and built a house, and only discovered when it was approaching completion that he had forgotten the staircase—this hoary legend can only be a myth, without even the slender foundation upon which most myths rest.

It is rather curious that until the last quarter of the XVth century, although substantial dwelling-places of more than one story had been erected during 400 years, the staircase in universal use had always been the simple unadorned corkscrew or newel stair, supplemented at rare intervals by straight flights of steps equally devoid of ornament. It is true that in a few cases the head of the tube in which the winding stairs were contained was vaulted with some

**Bungalow, Shanghai.**

Messrs. Scott, Christie, & Johnson, Architects.

Fyvie Castle.

(From W. H. Godfrey's "The English Staircase." Batsford.)

attention to design; it is also true that, in some cases, a continuous handrail was worked in the stone wall. But these seem to have been the only efforts made by English designers towards ornamenting their staircases. French examples, on the other hand, especially in the early XVIIth century, abound in delightful touches, and many of them are monumental in character. It is interesting to see that the only specimens given by Mr. Godfrey which at all approach to the French treatment, are in Scotland; and they serve to emphasise the connexion of that country with France in the matter of architectural design. There is, perhaps, one exception figured in the book to the monotonous use of the spiral stairs in the Gothic period. This is shown on Plate II., and is at Downholland Hall, near Ormskirk. No date is suggested, but the balustrade is of solid oak pierced with cusped openings, and may be of the XVth century. It is a remarkable example.

The change in design which took place in Elizabeth's reign was quite startling. Hitherto stairs in circular turrets had of necessity been all "winders"—landings were very few. Now, they were all straight, and landings were introduced at frequent intervals, very few flights having more than eight or ten steps—"winders" were eschewed. Stone (or brick) had been the usual material employed, now it was wood. The construction was simple but substantial; the supports were obvious; the heaviness of the construction was lightened by a mass of ornament. In turning over Mr. Godfrey's plates, it would seem that the tendency of staircase design was to simplify the ornament and to reduce the heaviness; the obvious points of support gradually disappeared, and the contrast is remarkable between the early examples, with their huge newels, their stout handrails, and their massive strings, and the late examples, with neither newels nor string, and only an insubstantial handrail, representing, indeed, as Mr. Godfrey says, merely an "upward gliding plane."

There is a good selection of details, and the text is simple and to the point. Mr. Godfrey is accurate and painstaking (in spite of an apparent slip in regarding the new staircase at Rushon as being old), and he not only affords an insight into the development of staircase design, but gives interesting bits of detail of all periods. The get-up of the book is worthy of its contents.

Examination Work in Building Construction.

By Professor HENRY ADAMS, M.Inst.C.E., M.I.Mech.E., F.R.San.I., M.S.A., etc. (Published by the Author. 1911. Pp. 54. 2s. 6d. net.)

PROFESSOR ADAMS is already known to our readers as the author of several standard treatises on structural subjects. The present book is one which should be found of considerable value to students preparing for examinations kindred to those of the Society of Architects. It comprises a collection of the examination papers prepared by the author for the Society mentioned, together with an answer to every question and accompanying diagrams reproduced to half the size required in the examinations. The subject-matter covers a very wide range of information, and a fully-detailed index makes the book additionally useful.

Woodwork, Carpentry, and Joinery. By THOS. C. SIMMONDS, Hon.A.R.C.A. Second Edition, revised. (London: George Allen & Sons. Pp. 66. 1s.)

INTENDED as an elementary course of instruction in compliance with the requirements of the Board of Education and the City and Guilds of London Institute, this excellent introduction to the subject has been found so far useful as to demand the issue of a second edition. The treatment is particularly rudimentary, and, while suited to the special purpose for which it is written, the book is one we do not recommend to others than absolute beginners.

A Specification for Reinforced Concrete Works. By A. ALBAN H. SCOTT and PERCIVAL M. FRASER. (London: Witherby & Co. 1911. Pp. 29. 3s. 6d. net.)

THE desirability of a standard specification for works of the kind denoted above has already been recognised by several firms of reinforced concrete specialists, but until publication of the volume here noticed nothing of the kind has been written in this country by independent professional men. There are several clauses in this specification which are distinctly open to discussion, particularly from the standpoint of the contractor. The book will probably serve a useful purpose by encouraging the issue of a standard specification by the Concrete Institute after all interests involved have been duly taken into account, and purely technical points have been duly considered by a committee of architects, engineers, and specialists in reinforced concrete.

Motion Study. By FRANK B. GILBRETH, M.Am.Soc.M.E. (London: Constable & Co., Ltd. 1911. Pp. 116. 4s. 6d. net.)

AT first sight this book appears to be a treatise on the study of mechanical movements, but it is in reality nothing of the kind as the term is commonly understood. The object of the author is rather to invite the study of motions made by workmen and others in the performance of their daily tasks, and to show how the amount of work accomplished may be greatly increased without increased labour simply by proper attention to working conditions, the proper subdivision of labour, and scientific management. The book is highly suggestive, and is one which we have pleasure in bringing before the notice of building contractors, feeling sure that they will find in it many hints of specially valuable character.

Motors, Secondary Batteries, Measuring Instruments, and Switch-gear. By S. KENNETH BROADFOOT, A.M.Inst.E.E. (London: Constable & Co., Ltd. 1911. Pp. 96. 1s. net.)

THIS is one of a series of electrical installation manuals, the scope of which is generally shown by its title. The book is conveniently arranged in numbered paragraphs, each with a clearly-printed title, which, with the assistance of the index, should make the manual very useful for the purposes of reference. All information is given in concise terms, and the book is one which may be commended to those requiring guidance on the subjects discussed.

A Practical Guide in the Preparation of Town Planning Schemes. By E. G. BENTLEY, LL.B., and S. POINTON TAYLOR, A.R.B.A. (London: George Philip & Son, Ltd. Price 5s. net.)

THE book aims at providing a practical work for the guidance of the members and officers of the various local authorities concerned in the preparation of town-planning schemes.

Considering the somewhat complicated nature of the regulations of the Local Government Board, we have no doubt that a carefully-compiled treatise, which endeavours to put the subject before the public in a comprehensive and intelligible manner, and which reviews the various subjects which may be dealt with in the town-planning scheme in the order in which they will require consideration, will meet with a cordial welcome.

As Mr. Raymond Unwin points out in a foreword, the collaboration of a lawyer and an architect to produce a book on this subject is particularly appropriate, and we think the result of this collaboration will be found most useful to all concerned.

The book contains appendices giving the text of the Act; the Procedure Regulations; Extracts from the Hampstead Garden Suburb Act, 1906; Extracts from the Liverpool Corporation (Streets and Buildings) Act, 1906, etc. Also specimen forms of notices and advertisements, and a model set of coloured plans, in a separate thumb case, prepared in accordance with the regulations, which, we think, should prove most valuable.

But this is not merely a book of reference. Many of the points, such as, for example, the preservation of objects of natural beauty or antiquarian interest, the comparative values

of straight and sinuous roads, the placing of trees and grass margins, and the treatment of forecourts and gardens are referred to in a suggestive and helpful manner.

The criticisms and suggestions for the future improvement of this book which the authors invite will come more aptly from those who have had the opportunity to test its usefulness in an entirely new form of procedure. We will content ourselves with entreating the authors not to continue the "pursuit of oneness as a unit" or of "oneness as a whole" until they have exhausted the resources of the language in the pursuit of a better expression.

Steel Bar and Plate Tables. By EDWARD READ. (London: E. & F. N. Spon, Ltd. Sheet of 4 pp. 1s. net.)

THE tables on this folding sheet give the weight of L, T, and flat bars, plates, nuts, bolt heads, round and square bars, chains, corrugated sheets, sheet and hoop iron, lead pipes, and wrought-iron tubes. The arrangement is convenient, and the tables will doubtless be found useful to those having frequent occasion to deal with weights of the kind included.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held in the County Hall, Spring-gardens, S.W., on Tuesday, Mr. E. Whit, Chairman, presiding.

Loans.—It was recommended by the Finance Committee, and it was agreed, that a loan of £3,790, should be made to the Islington Borough Council for purchase of premises at Hornsey for homes for children.

Theatres, etc.—Drawings have been approved by the Theatre and Music-Halls Committee as follows:—

Adelphi Theatre—Enlargement and rearrangement of urinal apartment for the stalls.

Prince of Wales Theatre—Ventilation of rooms in basement.

Royal Adelaide Galleries, Strand—Various internal alterations.

Imperial Hall, Grove-vale, East Dulwich—Rearrangement of exit from small hall.

London Opera House—Addition of six private boxes on the stalls level.

London Palladium—Duct work for proposed ventilation at the London Palladium.

New Gallery Restaurant—Provision of a waiting-room and alterations in the basement.

Whitechapel Public Baths—Cinematograph box.

Chelsea Palace of Varieties—It is proposed to enlarge the first circle at this hall for the purpose of rearranging the seating in the auditorium with other small alterations.

Cinematograph Theatre.—The same Committee also reported that it was proposed to erect a cinematograph theatre on a site at the rear of 23, High-street, Putney.

Repaving.—In a Report of the Highways Committee it was stated that the wood-paving of the bridge carrying Chalk Farm-road over the Regent's Canal was worn out, and that the British Cork Asphalt, Ltd., have offered to repave the bridge at 10s. per yard super., and also to maintain the paving for five years at 6d. per yard super. per year.

Crossness Pumping-Station.—The Main Drainage Committee recommended, and it was agreed, that tenders should be invited for lithographing the drawings and printing the specification and quantities in connexion with this pumping-station, which is to be enlarged.

School Accommodation.—The Education Committee reported that it was desirable to provide 1,240 additional school places in Islington, and that negotiations for the acquisition of a site for the erection of a school are in progress.

It was also stated by the same Committee that it was proposed to erect a school for about 100 physically defective children in Elthorne-road, Islington, N.

Fire-Station.—A new fire-station is to be erected at St. John's Wood, the estimated cost of which is £3,000. The Fire Brigade Committee reported that a suitable site had been purchased for £3,000, for that purpose.

Tottenham Fields Estate.—The Housing of the Working Classes Committee reported that in view of the progress made in the erection of cottages on section C of this estate, it was desirable to complete the carriageways and footways of the roads at an estimated cost of about £370.

Victoria-embankment-gardens.—Owing to the condition of the York-water-gate at these gardens, the Parks and Open Spaces Committee reported that the stonework was to be treated with baryta water, which would render the stone resistant to the attacks of the atmosphere.

CORRESPONDENCE.

Manchester Library and Art Gallery Competition.

SIR,—Certain passages in the letter of protest against the award in the Manchester competition which appeared in your columns last week seem to call for criticism, and I shall be glad if you can devote a small space to the following remarks.

In regard to the objection raised to the premiation of certain competitors, on the ground that their plans exceeded the limit of area imposed by the conditions, does Mr. Willoughby advise the rejection of a brilliant design because the projection of a base-course was exaggerated on one-sixteenth-inch scale plans? For in a building of this size such an error might well account for an area of 50 yds. The writer goes on to say that an additional area of 50 yds. would admit of a "row of handsome columns" along the front. No doubt it would; but surely the suggestion that a building provided with a "row of handsome columns" is, *ipso facto*, more beautiful than another not so endowed is one of the grossest fallacies of the amateur. Doubtless the public thinks so, for the public loves a column—particularly if it be handsome—just as an Englishman loves a lord—probably from similar motives. But an architect is not a tradesman who must supply his public with what he thinks it wants, but an artist whose aim it is to create beauty, which will supply his public with what he knows it needs.

I cannot conclude without reference to Mr. Willoughby's protest on the ground that the assessor has never superintended the erection of any building of a similar character to the proposed Library and Art Gallery.

Was not the fact that the writer himself competed, in full knowledge of the assessor's name, a tacit acceptance of his ability to adjudicate? If Mr. Willoughby had been one of the selected ten, is it likely that he would have raised any objection on this score, or have hinted, be it never so delicately, that the assessor was quite unfitted for the onerous duty which he had undertaken to perform?

MAURICE LYON.

A National Memorial to King Edward VII.

SIR,—Now that the memorial to the late Queen Victoria has at last been opened in the Mall we should seriously think of erecting a grand and fitting memorial to our late great King, Edward VII. the Peacemaker, in the Metropolis of this vast empire. There has been a good deal of agitation lately about building a new bridge across the Thames near St. Paul's Cathedral. In my humble opinion this scheme of a memorial to King Edward VII. in the City of London would be most suitably carried out by erecting a fine bridge and grand avenue from south to north on the western side of St. Paul's Cathedral, the proposed avenue cutting through a grand square to be named St. Paul's-square, on the western side of St. Paul's, this square to be treated in a similar manner as that of St. Peter's, in Rome; our much-lamented late King, Edward VII. The grand square would open up the view to St. Paul's Cathedral, which is at present most cramped up and built in, a large equestrian statue of Edward VII. facing the west in front of the Cathedral. In Paris, Berlin, Vienna, and other great continental cities they perpetuate the memory of their great by erecting grand and lasting memorials. As I said before, we must not lose this opportunity, but carry out the scheme of a memorial to our late King Edward VII. the Peacemaker, not by the erection of a statue in some street, square, or park, but such as suggested above. Every Englishman, both at home and all over the world, would gladly subscribe to this grand national scheme. HENRY H. B. SANG, Architecte-Decorateur (Paris)

Bradford Royal Infirmary.

SIR,—I have seen Mr. Pite's design in your current issue, and have read your interesting criticism upon it with pleasure. One does not, as a rule, criticise the work

of men who have beaten one, but in this instance I hope you will find space for these remarks of mine, which may be of interest.

With regard to the spacing of wards, one wonders whether the omission of the sanitary annexes from the end is caused by the closeness of spacing, or suggested by it, or whether they have been so placed for convenience of working. The sun balconies are thus left unprotected from east and west winds, and in our climate will be somewhat exposed.

In Mr. Pite's planning of the administrative building has not the struggle to avoid the internal court (really immaterial in such a low building) seriously affected the general compactness and convenient working of this very important department?

The Nurses' Home has an east and west axis, so that many of the 120 bedrooms will have a north aspect. This applies also to the Servants' Home.

The placing of the maternity ward necessitates patients, entering as they do by the out-patient building, "running the gauntlet" of the entire length of the main connecting corridor. The operating-rooms, being of two stories, render the lighting from the top (a definite "instruction," by the way) of the lower ones an impossibility.

I suppose there are few competitors who do not think their own scheme far finer than the winning one, and that their non-success is, of course, due to the predilections of the assessor. To all such I would say, "In future study those predilections, and better luck next time." NEVER SAY DIE.

Questions for Builders.

SIR,—From time to time various grievances have been ventilated in your columns, but I venture to assert comparatively few that directly concern the builder.

It is not that these grievances do not exist, as the very keen competition prevailing, together with the damaging effect of current legislation and the tyranny of the authorities, have made the business of the builder very onerous.

It is to be regretted that the Master Builders' Association do not by the force of its co-operation put sufficient pressure on those concerned to relieve the growing evils affecting its members.

I am certain a list of these evils could be given that would keep the Master Builders' Association busy for a long time endeavouring to secure that reform which is daily becoming more necessary if the builder is to continue his existence.

I may add that while I am not a member of the Master Builders' Association, yet I would gladly join them if they defended the interests of their members one-quarter as much as some of the operative unions protect their members.

At the moment I will content myself to quoting one item, viz.:

That the City of Westminster Council invariably demand anything from five to ten times the ultimate cost of reinstatement after hoardings and gantries, and that they hold large balances considerably longer than they as servants of the public are entitled to do.

It is not so much a question of loss of interest on this money, but I am of the opinion that, working on their own experience of the costs of reinstatements, the payments demanded could be more in proportion to the cost, and balances paid out within, say, a week or two of completion.

This is but one of many grievances that should be remedied, and one that will readily be recognised by fellow-sufferers in the business, and I should very much like to see a continuation of this correspondence that would bring to light the worst of the grievances, in the hope that they may be remedied. BUILDER'S MANAGER.

INTERCOMMUNICATION COLUMN.

Cassell's Points.

SIR,—I am seeking information about Cassell's paints. If any of your readers would be good enough to give me their experience of them, also which is the best, and where it can be got, I should be greatly obliged. ARCHITECT.

EDITORIAL SUMMARY.

The leading article is entitled "Fragmentary Old Painted Glass: Its Due Treatment," and it includes several illustrations bearing on the subject.

Notes, p. 4, contain: "Bedford College for Women"; "Rembrandt's Homes in Amsterdam"; "Exhibition of Egyptian Antiquities"; "St. Paul's Bridge"; "The Institute Gold Medal"; "A Ministry of Fine Art"; "Our New Stamps"; "The R.I.B.A. Address to the King."

The annual dinner of the Royal Institute of British Architects was held on Tuesday in Fishmongers' Hall, Adelaide-place, London Bridge, in the presence of the Lord Mayor of London, the President of the Institute and Mrs. Stokes, and a large gathering of ladies and gentlemen. A report appears on p. 6.

Book Notices (p. 9) include: "The English Staircase"; "A Practical Guide in the Preparation of Town Planning Schemes"; "A Specification for Reinforced Concrete Works"; "Motion Study"; "Examination Work in Building Construction," etc.

Correspondence (p. 11) includes letters on: "Manchester Library and Art Gallery Competition"; "Questions for Builders"; "A National Memorial to King Edward VII."; "Bradford Royal Infirmary."

The Monthly Review of Civic Design (p. 13) contains: "St. Paul's Bridge" (with illustrations); "Town Planning Review" (illustrated); "The City Beautiful"; and Notes.

The Building Trade Section (p. 19) includes: "Recent Derrick Tower Construction" (with illustrations); "Builders' Tools in the Middle Ages"; "Projected New Buildings in the Provinces"; "Applications under the 1904 Building Acts," etc.

Legal Column (p. 23) includes: "The London Building Act"; "The Housing and Town Planning Act."

Our Law Reports (p. 23) include: "Eastbourne Building Dispute"; "Lorden & Son v. The King."

MEETINGS.

SATURDAY, JULY 8.

The Architectural Association.—Visit to HUL Hall, near Epping, and to the Church of St. John, Epping. Train leaves Fenchurch-street 2.12 p.m.

MONDAY, JULY 10.

Incorporate Guild of Works' Association (Carpenters' Hall, London-west).—Monthly meeting. 7 p.m.

TUESDAY, JULY 11.

Guild of Architects' Assistants.—Visit to the British Museum Extension. 6.30 p.m.

COMPETITION NEWS.

Australian Federal Capital.

Some particulars were given in the *Builder*, June 23 (p. 789), as regards this competition. We have now received from the offices of the High Commissioner for Australia, 72, Victoria-street, S.W., full details, which arrived from Melbourne by the last mail. The documents furnished us are voluminous, and comprise a map of preliminary contour survey of country about Canberra (scale 20 chains = 1 in.); two copies of map of contour survey of site of Federal capital at Canberra (scale 400 ft. = 1 in.), contours (5 ft. vertical intervals); topographical map of Federal territory of about 900 sq. miles (scale approximately 6,000 ft. = 1 in.); map of the State of New South Wales, and map of the south-eastern portion of the said State; geological map of the city site, and two reports by the Government geologist of New South Wales; map showing rainfall and temperature statistics of the site for the Federal capital and surrounding districts; report by the Commonwealth meteorologist on the climate of the Yass-Canberra district; reproductions of two landscape sketches taken from points within the city site.

The particulars and conditions for guidance of competitors state that the Commonwealth undertakes to remunerate the authenticated author or authors of the designs that may be placed respectively first, second, and third in order of merit at the final adjudication as follows:—For the design placed first, premium 1,750*l.*; for the design placed second, 750*l.*;

for the design placed third, 500*l.* Geometrical plans and sections are to be prepared to scales based on the British standards of measurement, and the general map of city design shall be drawn on contour map of the survey of site of Federal capital at Canberra, which is one of the documents mentioned above. No other restriction is placed on the method or character of the drawings submitted. It is desirable that at least suggested outlines of the more important public and other buildings, parks, gardens, bridges, and principal constructional features be indicated in so far as they illustrate the general design. The drawings are to be mounted on linen and on stretchers, and it is desired that these shall not greatly exceed the dimensions of the contour map already referred to. The designs must be delivered to the Secretary of the Department of Home Affairs, Melbourne, on or before January 31, 1912. The designs delivered and admitted to competition will be submitted to a board consisting of an engineer, an architect, and a licensed surveyor, appointed by the Governor in Council for investigation and report to the Minister of the Department of Home Affairs. The Minister will adjudicate upon the designs, and his adjudication will be final and without appeal. The decision of the Minister will be announced in Melbourne within two months of the date of the receipt of the designs or as soon thereafter as is possible.

Immediately after the announcement of adjudication, it is intended to publicly exhibit in Melbourne for a reasonable period all designs admitted to competition. Should the competitors desire, on their own behalf, to arrange a second exhibition in London or elsewhere, the Minister will, if requested, supply as exhibits reproductions from the originals of the premiated designs only. The premiated designs shall become the property of the Government for its unrestricted use either in whole or part. Any claim for further remuneration by one or by all of the authors or their assignors or legal representatives will not under any circumstance be recognised. The Government, in consideration of the undertaking to pay the premiums mentioned, becomes entitled to call for, and to be furnished with, additional information, including such elucidating plans, sketches, and reports as it may be advised by the Board are requisite. Such information need not necessarily be in the nature of working drawings or specifications, but similar in character to the original designs themselves, and such as may not have been practicable to fully develop in the first instance without such further information. On the application by the Minister for such information, the competitor shall forward the same so that it may be received within four months from the date he should have received the application in the ordinary course of the post, but such application shall be made, if at all, within two months of adjudication upon the original designs. The premiums mentioned are to cover the cost of supplying the additional information, and the Minister will not recognise any claim for payment beyond these amounts. Of the several premiums, 75 per cent. will be paid on adjudication, and the remaining 25 per cent. on the receipt of such additional information as may have been asked for, if any. Should,

however, the Board consider the designs as submitted to be sufficient, the full premiums will be paid on the final adjudication. No unsuccessful competitor shall have any claim for payment in respect of any apparent adoption of his proposals or any part of them as disclosed by any designs he may deliver. The Government, by its own officers, will give effect to the adopted design. A model of the city site on a horizontal scale of 400 ft. to 1 in., with a vertical scale of about 100 ft. to 1 in., has been prepared, and a cast of the model can be inspected at the offices of the High Commissioner, 72, Victoria-street, S.W.

We propose to deal with the scheme at length in a future issue.

ILLUSTRATIONS.

"Burdocks," Fairford, Gloucestershire.

HIS house, which is nearing completion, is situated about a mile from Fairford, in Gloucestershire, and is built with rubble stone and Bath stone dressings and cornice, etc., the roof being covered with stone slates.

The entrance lodges and stables, which were completed some short time ago, are built of similar materials.

The contractors for these and for the shell of the house are Messrs. Yells Bros., of Fairford. Mr. E. Guy Dawber is the architect.

Design for a Country House.

THIS house is designed to give a south-east aspect to the garden front. The exterior walling is to be in local sandstone and the roof-covering to be hand-made sand-faced plain tiles, the woodwork to be in oak. The hall is to be panelled to its full height, and the floor to be brick-on-edge laid to pattern and beeswaxed; windows to be fitted with gun-metal casements. The design is by Mr. C. Castelow, architect, of Runcundy, Leeds.

Owen Jones Prize Drawings.

ONE of our plates this week is devoted to some drawings by Mr. A. W. Bellis, who was awarded the Owen Jones Prize of the Royal Institute of British Architects last January. Other drawings by Mr. Bellis were reproduced in our issue of April 7. Professor C. H. Reilly, in his address to students on January 30, said:—"The Owen Jones Studentship has produced two good sets of drawings by Mr. Bellis and Mr. Oakley. Perhaps Mr. Bellis, with his power of drawing the figure, is the stronger man. His drawing of the Pompeian decoration from the Castle of St. Angelo is particularly good. His colour, though, is not so good as his draughtsmanship, for some of his drawings suggest the reproductions in Mr. Owen Jones's book rather than the thing itself."

Bridge of St. Angelo, Rome: Showing Axial Approach.

ST. PAUL'S BRIDGE.

EXACTLY a twelvemonth ago we dealt with the Corporation scheme for St. Paul's Bridge in an illustrated article, in which we endeavoured to consider the question from different points of view, and to appreciate and do full justice to that of the promoters.

Since then the unexpected has happened, and we can only record our profound gratitude that instead of bewailing another, and in some respects perhaps the finest, of London's lost opportunities, we are able to congratulate ourselves that all is not yet lost, but that there is still before us a chance to redeem our character and to rise to the height of a magnificent and unique opportunity.

The scheme has been referred back for further consideration from the architectural point of view. In our previous article we pointed out that many other aspects of the question had not been properly thought out. We hope and believe that no further attempt will be made to rush this scheme through with undue haste to suit Parliamentary or other convenience. Time is required, not only to study the scheme in itself, but also in its relation to the future development of London as a whole.

Before any definite solution of the problem is decided on it might be as well to try to discover what the problem really is, and whether this bridge is the proper remedy for the traffic defects, which all acknowledge. We are inclined to think that the problem has not been rightly stated.

The reasons for building this bridge are two in number. First, that better communication is required from this part of the City to the south side of the river, and, secondly, that better through traffic facilities are needed between the north and the south of London. The bridge is to serve both needs

and so to kill two birds with one stone. Is this idea the right one?

For the defects of local traffic intercommunication the bridge no doubt is an adequate remedy; but is it, and can it be a remedy for through traffic defects? This, we think, is open to doubt, and we suggest that from the point of view of either the through traffic itself, or of the Cathedral, this is not the place for a through traffic route, and that the attempt to create one here is a fundamentally wrong idea which is at the root of all the trouble.

To take the traffic first. We have already pointed out the disastrous results of pouring the north and south traffic across Cannon-street and Cheapside, so there is no need to dwell again on the obvious fact that these proposals will increase and not decrease the congestions at the crossings. Let us rather consider the question of levels and the natural formation of the ground.

The river taking a wide, sweeping curve, the inside bank—the south bank—is, as usual, the lower. The north bank is the higher, and the highest point is crowned by St. Paul's Cathedral.

The problem is to take the through traffic from the low south bank to the higher ground behind the high north bank by the easiest gradient and the most uninterrupted route. A short distance to the west of St. Paul's the valley of the Fleet River breaks through the high bank and provides a gently rising gradient from the embankment level to the higher ground of the north of London, so avoiding the necessity of a steep pull up to the top of the bank.

We naturally ask—Why not use it? What advantage is there in lifting the through traffic up a steep gradient over this high bank when it could be taken through the valley

and so by an almost imperceptible gradient to the heights beyond? Why select the very highest point of all, and one crowned by a Cathedral? Even if the Cathedral were not there, the proposal would need more explanation than seems to be forthcoming.

We have also to ask ourselves whether, if constructed, the through traffic would ever use this higher road and toil up this extra 30 ft. or more in preference to going by the lower road over Blackfriars Bridge.

Traffic must be coaxed, not driven. You may take a horse to the water, and you may create passageways which you call through traffic routes, but unless they are the lines of least resistance the through traffic will not use them. Considering the unnecessary height to be negotiated in order to cross the viaduct over Queen Victoria-street, and the certainty of being held up both at Cannon-street and at Cheapside, it seems more than probable that the through traffic will prefer the lower road, even if it is a longer way round; for to vehicular traffic distance is a minor consideration compared with ease of gradient and freedom from cross traffic, and to the motor traffic of the future it will hardly count at all.

Now consider the question from the point of view of the Cathedral. Here we have a national monument of the first importance; by no means merely the Cathedral of the City which the City may claim to be allowed to treat as it pleases.

But even then every monumental building, whether national or not, requires a position, surroundings, and approaches in accordance with its character and the purpose for which it is erected. These can be determined by a study of the requirements necessary to enable it to fulfil its functions. In the first place, St. Paul's is a church, a sacred national

From a Survey of the North Bank of the Thames, in connexion with a Design for a Proposed Quay from Charing Cross to Blackfriars, by Lieut.-Colonel French. 1825.

temple, and it demands an environment and approaches in harmony with that essential, but apparently forgotten, fact.

Apart from the light and air and freedom from the danger of fire which all monuments require, a Cathedral in which national ceremonial services are solemnised with stately ritual requires a space around it of sufficient size and architectural treatment to permit of adequate magnificence of processional approach and ceremonial grouping in its precincts. It needs avenues to radiate its exalted influence to all parts of the City, and to afford direct approach to worshippers from all directions; but it is not a railway station or a meat market that we should deliberately concentrate through traffic upon the temple enclosure, the cathedral close, and turn what should be the somewhat cloistral or devotional aspect of the precincts into a seething maelstrom of traffic. The idea is offensive.

That St. Paul's Churchyard has been encroached upon and desecrated by former generations and is already overcrowded with traffic is a defect, not a virtue, of the plan of the City, the aim should be to lessen the traffic, not to increase it. As St. Paul's is on a hill, through traffic will avoid it, if possible.

At present the traffic only climbs Ludgate-hill from necessity, not from choice. No doubt it will some day be diverted on either side of the Cathedral by easier gradients.

The fact, then, that this particular spot is not only the highest and most inaccessible that could be found, but that it is also crowned by a sacred national temple whose precincts should be respected, suggests that this is positively the very last place in the whole City of London which should be chosen for such a purpose as a through traffic route.

If there is any truth in this point of view, St. Paul's Bridge should be treated as a local traffic route relieving Blackfriars Bridge, giving direct access from the south side to the City, and forming a radiating avenue and approach to St. Paul's. Blackfriars Bridge and Farringdon-street should be developed as the main through traffic artery or boulevard from the north to the south of London, for, apart from its easy gradient, it lies in a valley and can economically be bridged over with viaducts carrying the east and west traffic, as at Holborn Viaduct. This affords a clear run through from north to south, with possible provision for trams, while the absence of important buildings or historical

monuments permits it being widened and developed in a way that would not be possible where St. Paul's, St. Augustine's, St. Vedast's, St. Anne and St. Agnes, and the General Post Office all bar the way and have to be considered.

Should still further through traffic facilities be required, the regrading of Southwark Bridge will probably provide them at a position where it is possible to obtain another main northern artery.

If, then, the through traffic can be taken by another and better route, the last objection to the axial approach to St. Paul's Bridge is cleared away, as the trams can be taken through underground if desired with equal ease in either case. If the bridge can be regarded as a local traffic route it would naturally land as soon as possible in Queen Victoria-street, from which a fine rising approach would lead to St. Paul's, and the architectural problem would be considerably simplified.

This would lessen the expense by doing away with the viaduct over Queen Victoria-street, and would obviate the necessity for a Y-shaped or other unduly wide approach to the Cathedral. Such an approach seems open to the criticism of ignoring the natural slope of the ground and the direction of the main axis of the Cathedral. It creates a slope to its enclosure which is contrary to that direction, and permits this side approach to overpower the main one—which is, and must always be, by Ludgate-hill to the main entrance door.

The principal question left would be whether the axial approach and the bridge should be in the same straight line crossing the river on the skew, or whether the vista should change its direction at the change of levels in Queen Victoria-street and the bridge cross the river at right angles.

There is no doubt that the continuous straight vista over the bridge to the Cathedral is a most magnificent treatment, and that some sacrifice of convenience may well be made to obtain it, if it is a sacrifice of convenience only. But we must admit that the skew bridge has disadvantages both of convenience and appearance, though these perhaps look worse on paper than they would in reality. After all, it will, of course, depend a good deal on how it is done.

This appears to be the point that will need the most anxious consideration and the most careful weighing and balancing of the different conflicting interests and points of view involved.

Whatever is done, however, there seems to be no doubt that no scheme can be considered wholly satisfactory unless it takes into account the architectural treatment of the whole of the future surroundings and approaches to St. Paul's, and at the same time provides for the traffic east and west as well as north and south. As we have pointed out before, this scheme needs to be related to some general and comprehensive treatment of the whole of this district of London.

Map of Central Area of London,

Showing Blackfriars Bridge emphasised as the natural main through traffic route north and south, crossed by viaducts carrying the traffic going east and west, and St. Paul's Bridge regarded as a local traffic route landing in Queen Victoria-street.

Rochefort-sur-mer : Gate of the Prefecture.

"THE TOWN PLANNING REVIEW."

The first number of Volume II. of the *Town Planning Review* more than maintains the standard of excellence set up by Volume I. It opens with what is called a panorama of the amount of work which is entailed in the preparation of the first stages of a town-planning scheme under the regulations of the Act. With a view to giving reality to the article, an actual area in the peninsula of Wirral, in which the boroughs of Birkenhead and Wallasey are situated, has been selected, to which the

process is applied in detail, with the actual wording of the necessary notices, resolutions, letters, etc., and reproductions of the maps required. This should be of great service to all authorities contemplating the preparation of schemes, and, showing as it does that, dealt with in this way, the amount of labour and expense is not so great as was first imagined, it should afford some encouragement to proceed.

Professor Adshead contributes a valuable article on "Monumental Arches," profusely illustrated by most of the best examples from ancient Roman times to the present day, which is the first of a series to be

devoted to "The Decoration and Furnishing of the City." The writer discusses the purpose and the possibilities of the monumental arch, and "would like to see a revival of this finest of commemorative monuments."

"Southport; Some Suggestions for its Future Growth," by Mr. J. E. Jarratt, Town Clerk of Southport, illustrated with plans and views, deals with the requirements and growth of a seaside residential town in the centre of a great industrial community.

Mr. E. W. Marchant, D.Sc., has some interesting remarks on the effect on towns of the transmission of electrical energy, particularly in the direction of cleanliness.

In the third of a series of articles dealing with "Town Planning Schemes in America," the Editor contributes an account of the labours of the various societies and commissions that have devoted so much time and energy to the consideration of the improvement of Boston. As Boston is a comparatively old town on an irregular and diversified site its problems approximate more nearly to those of English cities than to those of the modern Western American towns. The article, therefore, should be of special interest to English town planners. It is fully illustrated by plans, views, and diagrams.

"The Grand Central Station of New York," by Mr. R. Anderson Pope, gives a good idea of the American method of dealing with the terminal station problem in a capital city.

An extremely interesting number is brought to a close with a review of current periodicals and a chronicle of passing events.

THE CITY BEAUTIFUL.

We take from the *Canadian Real Estate News* the following remarks, being part of a verbatim report of the American landscape architect, Mr. Olmsted, arising out of a visit to Montreal, when the principal matters discussed with the Metropolitan Parks Commission had to do with the selection of lands for parks and playgrounds, and with the location of boulevards and other lines of urban and suburban transportation:—

The main framework of any city plan is the transportation system, including in that term the public ways, both of local and of general importance, the street railways, the rapid transit railways, where such exist, the long-distance railways with their terminals, and the facilities for water-borne traffic. No matter how diverse or how independent may be the circumstances which determine and the authorities which control the several parts of such a system, the progress of the community and the convenience, economy, and general satisfaction with which its people can do their work and enjoy their lives, depend very largely upon the joint efficiency of these

Nevers : Porte de Paris.

diverse parts, considered as a single inter-related system for the movement of people and commodities.

When a place is small, both the length and the volume of such movements are so limited and so simple that a haphazard development of each part of the transportation system to meet the demands immediately pressing upon it gives rise to no serious inconvenience, but as the community grows the increase in the volume of the traffic streams, in the distances travelled and in the desirable speed of movement, enormously and indefinitely multiplies the burden placed upon the community by lack of economical correlation between the various means of transportation as well as by any deficiencies in each one of them.

Comprehensive Planning Necessary.

The location and width of the new streets which are daily extending the permanent framework of the city into new territory are now being fixed, in the main, by the local landowners. Their business is simply to market their land, and, so far as their limited control extends, to provide sufficient means of access to it to attract purchasers. It is not their business, and it is beyond their power, to provide for the main lines of transportation through other localities to give access to theirs; and no more is it their business to provide main thoroughfares through their own districts for the sole benefit of those beyond them, whose land will compete with theirs in the real estate market. It is nobody's business at present, and it ought to be made somebody's business to provide for the main channels of inter-communication.

This laying out of main transportation lines is not a thing to be done quickly and once for all, but a matter for painstaking and patient study and unremitting attention, beginning with the preparation of a general tentative plan and then proceeding gradually but persistently to execution, modifying the general plan from time to time, whenever it can be shown that a change, in view of all facts, really makes the plan as a whole better for the interests of the community, but never permitting the plan to be disregarded or set aside in execution. No such plan is of much value unless it has a permanent, active, responsible custodian, who will keep it up to date by improving it to meet conditions unforeseen at the time of its first preparation, and who will see that it is put into effect from time to time as circumstances permit. Such a custodian would be a permanent Metropolitan Commission, with a staff of engineers and designers constantly at work, on the one hand perfecting and extending the general plan and working up its details, and on the other gradually, a piece at a time, without haste or procrastination, bringing it into execution.

Rapid Transit Routes.

But whatever the best rapid transit routes may prove to be, these facts are tolerably clear about them:—First, that a paying rapid transit line cannot be built until after a large part of the district through which it is to run is pretty fully occupied—that is, until after most of the streets have been opened and built upon. Second, that the cost of installing a rapid transit line in a district already subdivided and built upon will depend mainly upon whether provision has been made in advance for such a line in the lay-out of the city, because in the absence of such provision it must either go under the streets, with all the drawbacks of subways, or encumber the streets most objectionably with an elevated structure, or cut its way through private building lots, all very costly operations, and apt to result in bad alignment at that. Third, that the question of how the city or any part of the city can have rapid transit, and how far and how fast the passengers can be carried for five cents will depend largely upon the cost of installing the lines. Fourth, that the speed, the range, and the economy of local passenger transportation is one of the most important factors making for comfortable and healthful homes for the mass of the people, and against the overcrowding of houses on the land and the exaction of excessive ground rents.

Surface Car Routes.

Of equal importance with the rapid transit lines properly so called, are the surface car routes, which will become the feeders of the

former, and which must be the main agency in extending the residential radius. While in the older part of the city the cars must generally occupy streets laid out before the invention of electric traction, there is every reason for making the strongest efforts to secure throughout the suburban area, where the street plan is still flexible, a system of thoroughfares calculated to give the quickest and most convenient routes for street cars, as well as direct lines and easy grades for teaming. These thoroughfares need ample width as well as good lines and grades. In a 60-ft. or 66-ft. street, unless the sidewalks are excessively and unreasonably curtailed, the roadway cannot be made wide enough for two vehicles to pass between the curb and the street cars. Therefore the main stream of slow-moving vehicles must perforce run upon the tracks.

If the traffic becomes heavy in such a street there is endless conflict, the drivers are inconvenienced by the cars, and the speed of the cars is seriously reduced. It takes a width of 48 ft. to 52 ft. between curbs to allow of two lines of vehicles between the street cars and the curbs, the former figure being cramped, and the latter distinctly preferable. No important street, therefore, that is likely to be occupied by car tracks should be given a less width than 80 ft. to 90 ft. on grounds of the baldest utility. A little additional width may allow the permanent maintenance of trees upon the sidewalks; but where new suburban land is being laid out a width of upwards of 120 ft. is very desirable on purely utilitarian grounds, because it permits the use of a special reservation for the electric cars by which means their speed can be considerably increased, and with these greater widths, trees and grass and other park-like features can be introduced to add to the amenity of the way. Such boulevards, from 120 ft. to 200 ft., or even more in width, are very generally to be found in progressive European cities, even those considerably smaller than Montreal, and they are becoming more and more numerous in America.

Main Thoroughfares and Local Streets.

It is very important in dealing with the subject of city planning to maintain very clearly the distinction between such main thoroughfares as we have been discussing and the local streets, of which the prime object is to give means of access to the lands and houses immediately abutting upon each, and in close-built districts to admit light and air to the buildings that line them. Nothing is to be gained by making such local streets any wider or longer or more direct or upon any flatter gradient than is absolutely needed to accomplish these purposes in a convenient and economical manner; and to require more than this, often means a needless waste of land, and of construction, cost, and maintenance charges which have to be paid for somehow, and in the end just add so much to the taxes and the rentals.

A very considerable degree of individual discretion in the lay-out of local streets ought to be permitted to the landowners, while, upon the other hand, no local or personal consideration whatever should prevent the laying out of the main thoroughfares on the lines and at the widths and with the grades that will make them the best possible transportation routes for the city as a whole.

General Considerations Affecting the Location of Playgrounds and Parks.

In any city closely covering a large area, well-distributed public playgrounds and neighbourhood parks become one of the urgent needs if the health and vigour of the people are to be maintained. And the most important classes to provide for are the children and the women of wage earning families. Most important because of their numbers, and of the direct influence of their health and vigour upon the efficiency of the coming generation; but most important also because they have less energy to seek out healthful recreation at a distance from their homes. Practically there are few women and children who will take the trouble habitually to walk more than a quarter of a mile in the city to a playground or local park for exercise or rest, and back to their homes again. For most a car fare is out of the question except for an occasional holiday excursion. This means that ideally there should be neighbourhood recreation centres, not more than a

quarter or at most half a mile from every home in the city. Considering the present deficiencies in Montreal that may sound like a remote ideal; but other cities are unmistakably advancing toward that ideal, and there is no logical halting-place till that is reached, although the progress toward it may be very slow in the older parts of the town.

Activities of Public Recreation Grounds.

The size, form, and character of public neighbourhood recreation grounds depend upon the functions to be performed by each. Some of the activities where they are well developed, as, for example, in Chicago, are these:—

1. The playing of little children in sand piles, and upon the lawn, and in a shallow wading pool, and in open shelters, under the watchful guidance of an attendant, who not only keeps them out of mischief and danger, but plays with them, tells them stories, and stimulates the healthy activity of their little minds and bodies. The mothers may come with their children and sit by them while they play, or may leave them in safety while at work. A plot but 100 ft. square may be of value for such use.

2. For the boys of larger growth, and also for the girls and women, the more active games and gymnastic exercises, with and without apparatus, in the open air when the weather permits, and under cover in the winter, always with the opportunity and inducement to wash and bathe, and sometimes with a swimming pool to boot. Sometimes space is found for the big field games, and regular athletic sports on a running track, sometimes for nothing that takes more space than basketball or fives.

3. For the older and less active people a few pleasant shaded walks and benches to stroll and sit upon, from which to see the youngsters play, and once or twice a week perhaps a band concert.

4. For the use of all a field-house, where the sanitary accommodations are kept to a standard of cleanliness and good order that sets a good example to the neighbourhood, where a reading branch of the public library is available, and in which one or more large rooms are at the disposal of the neighbourhood for lectures, entertainments, and dances; clean, healthy recreation given full play amid decent surroundings, instead of being driven to the saloon, dance-hall, and the like.

A full-fledged recreation centre is a large and elaborate affair, and a costly one to keep in operation, and until the taxpayers have satisfied themselves by tentative experiment that such things are worth their cost, a much more modest scale must be adopted; and there are such advantages in the possibility of gradually building up a group of related activities, that it is extremely desirable to secure rather good-sized tracts, 20 acres if possible, rather than split the same area into a large number of very small squares.

As to the total area to be secured, it is so seldom possible to get enough that there is little danger of overdoing the purchase of such local parks. There is a rather general consensus of opinion that about 5 per cent. of the total area devoted to local parks, playgrounds, and squares is a reasonable minimum standard at which to aim, and that more than 10 per cent. may be uneconomical.

Some of the most successful suburban real estate operators in the north-eastern United States have satisfied themselves, and are operating on the principle, that the dedication of land for local park purposes up to a reasonable amount, if so arranged as not to interfere with the lotting system, actually increases the net returns from the operation. On a plan which was drawn up by Messrs. Wood, Harmon, & Co. to illustrate the application of this principle, about 30 per cent. of the total area is devoted to streets (about the normal figure for New York City), and about 7½ per cent. to the park.

Considerations in Selection.

With the exception of certain park sites, which are more or less dictated by topographical considerations, the main consideration in selecting local park lands should be equitable distribution and cheapness. In the suburban and rural districts the presence of the old trees or other special features might have a considerable influence, but ordinarily such local parks must depend so largely upon artificial improvement that any slight natural

New York Riverside Extension.

advantages are easily counterbalanced by differences in the cost of the land. Most pressing is the acquisition of such parks in regions that are rapidly being built up, for the obvious reason that the enormous jump in the value of property which takes place through the erection of buildings upon previously vacant land is generally followed by a period of comparatively slow rise or even of decline in value as the buildings depreciate. Delay is apt to add but little to the cost in a region where buildings must be torn down in any case to make a park, whereas it adds enormously to the cost in regions at the growing margin. Out in the country beyond that margin, even though land can be obtained cheap, there is little reason for buying park lands except to preserve some special natural feature, such as a fine grove of trees, for future park uses, or to secure single tracts of unusual size or shape for special purposes.

The probable future increase in the value of outlying land is discounted in its present market value, and the generally optimistic tendency of the real estate speculator is apt to keep the market rates so high that interest on the cost and loss of taxes will in the long run more than counterbalance any saving the public can make by such speculative purchases.

In selecting lands in the more crowded parts of the city it is sometimes a helpful device to mark upon a map, by dots of an arbitrary size, representing a fixed number of people, the local distribution of population based on census returns, if obtainable by blocks or wards, or upon a school census, or voting lists, or other fair proportionate basis. With this as a guide the rest is largely a matter of bargain hunting, for which one of the important qualifications is to have cash in hand with which to do the bargaining.

RIVERSIDE EXTENSION SCHEME, NEW YORK.

In order to provide additional dock and traffic facilities on the Hudson River, the Commissioners of Docks and Parks, New York, propose to reclaim part of the foreshore, 200 ft. wide by $2\frac{1}{2}$ miles long, and to utilise the area, so placed at the disposal of the civic authorities, for the construction of quays, freight platforms, railway tracks, and a wide road, and to cover in the whole of these by a steel and concrete roof. Upon this covering will be laid earth of depth sufficient to provide for the growth of trees and shrubs to be planted after the site has been laid out as a public park. The general idea of the project is represented in the accompanying diagram.

At present the goods lines of the New York Central Railroad extend along the western shore of Manhattan Island, the operation of steam locomotives at street level being anything but pleasant, while the running of trains between Riverside Park and Drive and the Hudson is distinctly objectionable.

The new scheme provides for the construction of a stone embankment or wall at the average distance of 200 ft. beyond the present river wall, and on the filling deposited between the two structures will be provided railway lines, outside the existing tracks of the New York Central Railroad, a wide goods platform, a roadway for vans and other vehicles, a spacious platform for marine freight, and a quay equipped with two railway tracks. Light and ventilation will be provided for by numerous openings in the roof, and by the adoption of electric traction it is believed that the nuisance of noise and smoke which has long troubled residents in Riverside Drive will be considerably reduced, while the addition of a new park represents a noteworthy improvement.

KHARTOUM.

THE plan of Khartoum, lately rebuilt on general lines laid down by Lord Kitchener for military reasons, reminds us that as an Imperial race, with possessions in all parts of the earth, town planning has for us an unusually wide significance. At any moment we may be called upon to design towns under climatic and other conditions which are quite foreign to our own personal experience.

This suggests taking a wider view of the subject than can be derived from an exclusive attention to our own requirements.

Khartoum being laid out with streets of ample and perhaps unusual width—Victoria-avenue being 180 ft. wide, Khedive-avenue 150 ft., the main streets 120 ft., and the secondary ones 80 ft.—the question arises as to how far this is advisable in a hot climate, where the crossing of a wide street or open place, with the heat and glare of a pitiless tropical sun radiating and reflecting from a paved or macadam road, would be, we fancy, a thing to be avoided.

Here, if anywhere, the principle should hold good that the best laid out town is the one that has the minimum of paved road surface consistent with its traffic requirements.

When we realise that for three months of the year the town is liable to severe sand storms from the southern desert, we begin to see that there may be something in Vitruvius' idea of laying out a town to protect the inhabitants from the winds.

As he says, "Much care, then, should be taken so to set out the walls of a city that it may not be obnoxious to the pestilential blasts of the hot winds. . . . Streets and public ways ought, therefore, to be so set out that when the winds blow hard their violence may be broken against the angles of the different divisions of the city and thus dissipated."

This point of view may not be in accordance with the modern idea that the wind should have free access to the heart of the city, but when this wind is chiefly sand there may be something in it; while it is possible that anyone who has had personal experience of the east wind of such a town as Edinburgh might well think that an application of the principles of Vitruvius would be for the comfort, if not for the health, of its inhabitants.

Under unusual climatic conditions wide avenues leading out into the open country, or the radiating park system, may not be the last word in town planning.

Plan of Khartoum, 1910.
(By permission of the R.I.B.A.)

CIVIC DESIGN NOTES.

Hampstead
At the annual general meeting of the Trust held on June 14 Garden Suburb under the presidency of Mr. Trust, Ltd. Alfred Lyttelton, M.P., it was stated that the value of the houses on the estate is now about 573,000*l.*, representing, with the land and roads, a capital value of more than 750,000*l.* During the year the Ecclesiastical Commissioners have leased a further area of 112 acres to the directors, with whom the Copartnership Tenants, Ltd., have agreed to take additional lands, of 300 acres, from the Commissioners, thus increasing the total area to be developed by the Trust to 652 acres. The newly-acquired lands, which are traversed by the Mutton brook, will extend the Garden Suburb north-eastwards to the Great North-road at East Finchley, where is a station on the Great Northern branch line to Barnet and Edgware.

Swansea
Improvements.
MR. GEORGE BELL, Borough Surveyor of Swansea, has issued a report to the Property and General Purposes Committee in which he advocates certain reforms on town planning lines. The recommendations have been adopted in principle, and specific details of several schemes are to be discussed later on. That the Committee are alive to the possibilities of municipal enterprise is shown by their acceptance of the report, which contains the following clause:—

"The plan will entail a great deal of thought and work and be of slow and deliberate growth in order that it may be a reflection of the needs of the community. It will require the co-operation of many minds in order that all matters appertaining to the development of a large town may be arranged in the best possible manner. Systems of highways, tramways, water supply, and sewerage will need to be properly devised. Sites for open spaces, pleasure grounds, children's playgrounds, cemeteries, schools, and other public buildings should be arranged for in advance of the time of actual requirement. All branches of civic activity must contribute to its production, so that considerations of art, architecture, engineering, forestry, landscape, and finance may have their fullest expression."

Vacuum Street Cleaning.
CONSIDERING the length of time which has elapsed since the vacuum-cleaning system was introduced in Great Britain it is somewhat surprising that no enterprising municipal council has adopted the method for removing street refuse in dry weather without the wholesale diffusion of dust and disease organisms entailed by ordinary modes of street cleansing. In Berlin, Vienna, and elsewhere on the Continent vacuum-cleaners are used for the collection of street dust, and we believe that the same type of apparatus has been adopted in several American cities. As arranged for this purpose, the vacuum machine is driven by a petrol motor, also operating revolving brushes for loosening the dirt, and the vacuum apparatus by which the material is drawn into the receiver. Apart from hygienic considerations, the vacuum process is more economical than prevailing methods, and we hope its application for the purpose will not be longer delayed in this country.

Visitors from America.
A PARTY of 100 American citizens, accompanied by Mr. John Nolen, have arrived in England to see the working of the Town Planning Act. They are in London this current week, and will then visit most of the important towns in France, Germany, Belgium, Italy, and Austria.

Delegacies from Canada and Germany.
THE MEMBERS of the Canadian deputation, representing the municipalities of the Dominion at the Coronation festivities, will take the opportunity of visiting various garden and city suburbs in this country, by way of prelude to a more formal and systematic inspection in the course of next year. In this month a visit will be paid to this country, for a similar object, by the German Garden City Association.

Street Widening in the City.

We learn from the *City Press* that the decision of the Court of Common Council to acquire 35 and 36, Cheapside, and 1 and 1A, Friday-street, for the purpose of widening the latter thoroughfare marks another step in a much-needed improvement. Nos. 3 and 4 have still to be dealt with, but the lease of that block falls in some twelve years hence. The improvement was commenced in 1895, and when completed will make Friday-street 22 ft. wide throughout. The demolition of the present property will give an extra width of 9 ft. 6 in. at the entrance of the thoroughfare. The actual cost of acquiring the property will be 39,000*l.* The Goldsmiths' Company, who are the freeholders of the rest of the block, have, however, undertaken to purchase, at a *pro rata* charge to the whole, the narrow strip of land which will be left after the 9 ft. 6 in. has been thrown into the public way. By this means the Corporation will receive 23,000*l.*, or thereabouts, for a very narrow strip of ground only useful to the adjoining owners, and the cost of the improvement will thereby be decreased.

City Park Systems.

THERE is one essential difference between city parks in Great Britain on one hand and the organised park systems of the Continent and America on the other hand. Our own parks are usually isolated enclosures which, with a few exceptions, are rigorously closed often at an hour when they are most enjoyable. Continental and American parks and gardens are generally connected by leafy boulevards or driveways, forming the whole into a complete system, and, being open at all times, constitute a pleasant alternative to the streets for an evening stroll, while tending to bring the charm of nature into city life. It can scarcely be contended that British citizens are unfit for privileges enjoyed by dwellers in continental cities, and which, as a matter of fact, are granted in the case of certain Royal parks and many commons in the environs of London and other cities. More efficient organisation and a departure from the conservative methods hitherto prevailing are certainly to be desired on the part of those responsible for the creation and administration of parks, gardens, and open spaces generally in British cities and towns.

Development of an American Park in the City.

SITUATED at the altitude of nearly 1,300 ft. on the north branch of the Canadian River, the city of Oklahoma was settled in 1889, and now has a population of 70,000 persons. The streets are laid out on the symmetrical plan usual in the United States, and during the past ten years the growth of population has been accompanied by the formation and development of several large parks connected by a fine boulevard with the length of 28 miles encircling the city.

The growth of the entire system dates from the presentation of a one-acre playground by Captain Stiles, U.S. Army, an example followed by other citizens, and more recently by the purchase of land by the City Council. It is stated that in 1910 the authorities declined to spend 50 dol. in improving the first embryo park, although a week later they voted 25 dol. for the removal of refuse then covering its surface. This year the city possesses park lands whose value is estimated at about two million dollars, and by the sale of plots for building purposes they will ultimately be enabled to cover the entire cost of the park system. The largest park is the North-East Park, covering about 740 acres, and next is Trospier Park of 620 acres. About one-half of the land in these will be dedicated to the use of the public, and the remainder will be sold when the value has risen sufficiently for superior residences. The systematic development of the system dates from 1908, and a large amount of work remains to be done, but the enterprise of this city deserves notice as an object-lesson to municipal authorities in our own land, and particularly to those controlling the destinies of growing towns where land can now be obtained at moderate price.

Manchester Garden City.

THE Manchester scheme provides for dealing with the Alkington estate of 700 acres, which extends across north Manchester from Rhodes to Middleton Junction station by the creation of some 6,000 detached houses, eight upon an acre, to have gardens ranging from 250 ft. by 200 ft., and at rents of from 4*d.* to 1*d.* the square yard per year; the natural beauties of Rhode Clough and Rhodes Wood will be preserved.

Oak Common Estate, North Hammersmith.

A PROJECT is formulated for laying out the western section, 14 acres, of the estate of 46 acres which the Ecclesiastical Commissioners sold to the London County Council for nearly 30,000*l.* It is proposed to build, at an initial outlay of about 85,000*l.*, cottages of from two to five rooms, with sculleries, to be let at rents of from, say, 4*s.* to 10*s.* per week, and flats of one room or two rooms, and sculleries, at rents of 3*s.* 6*d.* or 3*s.* 9*d.* per week, with a church, schools, shops, institute, and so on, thus constituting a municipal garden city for the poor. The land lies between Wormwood Scrubs and the Grand Junction Canal. The total cost of the scheme in its entirety is computed to be 349,000*l.*

Stations on the Berlin Metropolitan Railway.

THREE factors have been considered in determining the type of underground railway stations in the city of Berlin, namely, the surface configuration of the streets, the cost of construction, and railway traffic conditions. In cases where the subway is beneath a wide thoroughfare with a central footpath the best type of station is one with an island platform, having one staircase for ingress and egress. In ordinary streets where the roadway is more than 9 metres wide the same type can be employed, the entrance to the stairway being on a refuge. If the roadway is less than 9 metres wide, two platforms are necessary, each with an access stairway either from the footpath or the ground floor of a building. Another matter taken into consideration was the possibility of having to provide for future branch lines or junctions, in each case it was necessary to make suitable modification of the design so as to avoid the risk of inconvenience and danger.

Two Authorised Schemes.

IT is stated that the Local Government Board have given their sanction to the preparation of schemes relating to the Ruilisp and Northwood estate of nearly 6,000 acres in north-west Middlesex, and to the Aston area, 1,450 acres, lying on the east side of Birmingham. The latter project is additional to that which has been already approved in respect of 2,300 acres in Quinton, Edgbaston, Northfield, and Harborne, on behalf of the Birmingham Corporation.

Road Schemes.

THE narrow coach road from Honister Pass through Barrowdale, and so by Lodore and Derwentwater to Keswick, is to be widened to 18 ft. at a cost of 6,500*l.* The Road Board will contribute 10,300*l.* to the cost of reconstructing the road from Colchester to Chelmsford upon which the Essex County Council will expend 11,000*l.* The Board have notified to the Lancashire County Council their intention to grant an aggregate sum of 30,000*l.* towards the estimated cost, 72,000*l.*, of schemes relating to, in chief, a reconstruction of the Chorley and Horwich roads, and a widening and improvement of the Blackpool and Preston, and Lancaster and Carnforth roads, and to the Staffordshire County Council their willingness to contribute 20,000*l.* of the 100,000*l.* required for the contemplated new road from Birmingham through the Black Country to Wolverhampton.

Surbiton, Surrey.

THE Surbiton District Council have unanimously decided to undertake a comprehensive scheme of town planning in all the undeveloped lands lying within their jurisdiction, concurrently with the formation of the new main roads recommended by the London Traffic Commission.

THE BUILDING TRADE.

RECENT DERRICK TOWER CONSTRUCTION.

SINCE the importation into England generally of the northern, or Scotch, system of scaffolding derrick stagings have become quite familiar accessories in building construction. We have no intention of describing in this article the combination of towers and platform customarily employed in this country for carrying the derrick cranes by which the site of almost every important

Fig. 1. Derrick Tower: Elevation.

building is effectively commanded in the present day. Our readers, however, will probably be interested in some details of recent derrick towers and accessories used in the United States.

The first example is that of the two towers with movable derrick booms designed and built for the construction of the Capitol at Helena, Montana. The main portion of the building, about 80 ft. high, is flanked by two wings, and in each of these a timber tower, 15 ft. square in plan by 110 ft. high, was constructed and provided with two steel booms 70 ft. long.

The towers were carried up to the elevation stated because it was found that this would permit them to be stayed by guy lines anchored outside the building, and would at the same time obviate connexions with the masonry. The four booms were able to command the entire site, and provided with special seats enabling them to be moved up as the work progressed.

Fig. 1 is a diagonal elevation showing the general design of the towers. Each of the four corner posts is built up of four 12-in. by 8-in. planks, bolted together with overlapping joints, the tower being divided into six series of vertical panels by horizontal struts and diagonal bracing, while the vertical panels are braced by diagonal steel bars.

With the exception of the latticed work at the levels intended for the attachment of the movable booms the horizontal parallel struts are composed of two 4-in. by 2-in. timbers, bolted together with an intermediate steel plate, like a fifth beam, and connected with the corner posts by means of angle-bar brackets. The horizontal diagonals are bolted to the struts, the arrangement being illustrated in Fig. 2.

At the two boom seats the main struts consist of two series of 12-in. square timbers spaced 3 ft. 6 in. apart, centre to centre, and

connected with latticed bracing and secured to the corner posts by vertical and horizontal angle connexions as represented in Fig. 2, where also may be seen part of the diagonal timber bracing.

The vertical panel diagonals consist of steel rods fitted with turn-buckles for

Another type of movable seat for derrick booms on timber towers is illustrated in Fig. 3. This device was designed by the Aberthaw Construction Company, of Boston, for use in building a four-story warehouse completed at Buffalo in April last year. The derrick boom in this instance was of timber

Fig. 2. Derrick Tower: Details.

tightening up, and connected by pins to the angle brackets bolted to the corner posts, these brackets being 5 in. by 3½ in. by about 24 in. long, so as to serve for connecting the horizontal struts as well as the diagonal ties.

The base of the tower is formed of 12-in. square timbers, with suitable bracing, and the top, having timbers of the same cross section, has a riveted steel cap at each corner. Each cap consists of a top and two side plates, the latter bolted through the post, the cap being provided with connexions for attachment of the guy lines and horizontal diagonal bracing formed of 1½-in. diameter steel bars with turn-buckle adjustment.

The steel boom, with the uniform width of 8 in., tapers from 5 in. deep at the ends to 16 in. deep at the middle, and at the bottom end is hinged to a 3½-in. diavertical pivot working in two bearings 18 in. apart. These bearings are provided by a riveted steel split collar, of the construction shown in Fig. 2, clamped around the corner post. This form of seat makes it easy to change the position of the boom as may be required, providing the construction of the tower is suitably strengthened, as in this example, at the two levels indicated.

The towers here described were designed and built for the contractors by the Terry and Trench Company, of New York. Each tower includes nearly 13½ tons of steel and 11,000 ft. of timber.

6 in. square at the heel, and connected with the pivot by means of a steel fork and bolts as shown. The seat consists of two pairs of castings 8 in. wide by 5 in. deep by 4½ in. thick, forming a diamond-shaped gap to fit a 6-in. square post diagonally. The two sets of clamps are secured by bolts and nuts

Fig. 3. Movable Seat for Derrick Tower.

passing through a 12-in. by 5-in. by $\frac{3}{4}$ -in. steel plate at the inside face, and through a 5-in. by $\frac{3}{4}$ -in. angle bracket 12 in. long at the outside face. In the horizontal flange of the brackets holes are drilled for reception of a 2-in. diameter steel pin with two collars. This pin forms the pivot for the derrick boom, and at its upper end the derrick fork is attached by means of a $\frac{3}{4}$ -in. diameter bolt.

The tower to which the derrick boom was attached had been built to accommodate an elevator for hoisting concrete to the different floors of the building, and the boom was employed for hoisting materials generally. As the height of the construction increased the derrick boom seat was successively raised, so that the highest floor might always be commanded.

As our readers may see from the drawings, the shifting operation could be very readily performed. One special merit of the arrangement is the application of a derrick boom to a tower built for an entirely different purpose, thus making one tower do the work of two, and effecting a proportionate saving in the cost of erection plant.

A recent instance of the way in which wood is being displaced by other materials in so important a timber-growing country as the United States is furnished by the steel construction towers employed in building

the Massachusetts Cotton Mills, at Lowell, Massachusetts, a structure of twelve stories, with the total floor area of more than 300,000 sq. ft.

Details of one of the towers are given in Fig. 4, where it will be seen that they are built up of interchangeable lengths, 10 ft. 9 in. in height over all. The four corner uprights consist of 4-in. by 4-in. by $\frac{3}{4}$ -in. angles, and the horizontal and diagonal members of the bracing of 2 $\frac{1}{2}$ -in. by 2 $\frac{1}{2}$ -in. by $\frac{1}{2}$ -in. angles. These sections, together with the necessary gusset plates, are connected by rivets, the whole forming a strong and rigid cage of comparatively small weight. The two 5-in. channels shown in the plan and elevation serve the purpose of guides for a hoist, and at one side a ladder made up of light angles and 5-16-in. rods is fixed to the framework of each tower length. The small holes shown in the uprights are for fixing the seat plates of derrick booms, which can be pivoted at any elevation and readily shifted as occasion may demand. The boom seat adopted was somewhat like that illustrated in Fig. 6, but with the modifications rendered necessary by the use of steel corner posts.

These towers are suitable for any class of building construction, and possess the advantage that their height can be increased by adding further lengths.

At the Massachusetts Cotton Mills two towers of ten lengths each were employed, making up the total height of 107 ft. 6 in.

The cost of the towers per 10 ft. 9 in. length was 10 $\frac{1}{2}$ ¢ each delivered on the site ready for erection, or 100¢ per tower.

The cost of erection, including the installation of derrick, motor, and everything in connexion with the towers was 90¢. 15s. per tower.

Thus the total cost per tower was 190¢. 15s., which may appear heavy as compared with that of timber, but it must be remembered that the steel units are capable of being used over and over again for several years, while the timber used in building wooden towers, is worth very little at the end of a contract.

Firms having a constant succession of contracts demanding the employment of construction towers, the adaptation of steel in the manner described will probably result in considerable savings. The towers here cited were built from the designs of the Aberthaw Construction Co., by the Russell Boiler Works, of South Boston.

BUILDERS' TOOLS IN THE MIDDLE AGES.

It is improbable that any tool used by a mediæval builder remains to-day, though those of earlier times survive. To get at a knowledge, therefore, of those tools used in this country in the Middle Ages recourse must be had to the literature of those times and to those miniatures illustrating the manuscripts.

These miniatures, or little pictures, bear evidence that they were in most cases drawn by those to whom building tools and building operations were more or less familiar; they form certainly the better of our two sources of information.

The trowel and hand mortar board, both exactly of the same form as those in use to-day, pick and spade, the hammer, compasses, straight-edge, chisel, gimlet, squares (of various kinds), auger, adze, mallet, bench, shovel (for mixing mortar and filling the hod), ladder, scaffolding, and pincers were all in common use, and require no notice. Several other tools, however, require perhaps some few words of explanation.

The Hod.

The mediæval hod was very like the butcher's wooden tray of to-day, but without the four projecting handles at the corners, and it was a good deal smaller and considerably deeper. It was carried on the left shoulder because the right hand would be the more able to grasp and hold the front edge of the hod. The stick apparently became attached in the XVth century, but the combined hod and stick did not become common till some time later.

A Carpenter's Shop.

From a Drawing of the XVth Century.

There is some evidence, but it is not conclusive, that a three-legged stand with a ledge upon which to rest the hod whilst it was being filled with mortar, was at times employed.

Brace and Bit.

A brace and bit are depicted lying on the ground in the little picture of mediæval carpentry reproduced in the *Builder* for June 9 (where other tools are represented as well). The reproduction in question, being in one colour, does not show the distinction of the materials. In the original the brace is shown as of wood and the bit as of metal.

Saws.

Several kinds of saws were in use:—

1. The great pit saw, used by two men in a saw pit.
 2. The frame saw, known to the mediæval carpenter as a "whippet saw," and which was at times of so large a size as to necessitate its being worked by two men.
 3. The hand saw.
- The "twart saw" we are unable to identify. The file for sharpening the saw is mentioned in mediæval times, also a "sett for a sawe."

The Plumb-line and Level.

The plumb-line to be held in the hand alone without any frame was in use, and the level formed by a frame with a suspended plumb in the centre was common.

The Plane.

The common mediæval plane was a large one, answering to our trying-plane of to-day.

In place of a handle a big bead often ran along the top, which was grasped by both hands. In some illustrations the shavings are seen rising as the plane is pushed along. The mention of "ij plane irons" occurs in an early inventory.

The Striker.

In a very interesting little picture in the British Museum a workman is represented as in the act of drawing the striker along the edge of a square. The mediæval striker consisted, apparently, of a point, the other end being inserted in a handle. It had not (as it has to-day) a point at one end and a blade at the other. From the fact that the working end when in use was always set against the side of a square or straight-edge it is not easy to see whether mediæval strikers consisted of a blade or a point. Probably, however, we shall not be far wrong if we consider the triangular blade of to-day to be a more or less modern addition, and the striker of the Middle Ages to have consisted of a point only.

The Womble.

Dr. Bradley has explained in his edition of Strutt's "Middle English Dictionary" that the "wimble" was a boring iron. We may, perhaps, conclude that the womble was an early form of bradawl.

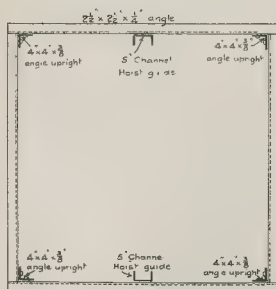

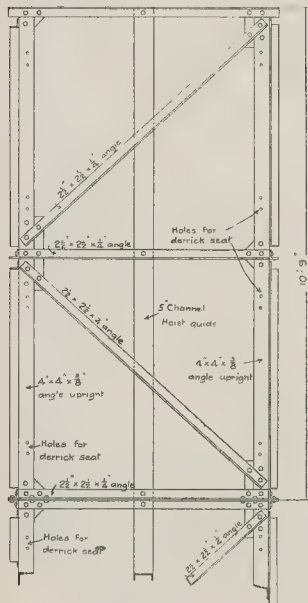

Fig. 4. Steel Derrick Tower: Plan and Part Elevation.

The Rule, Calipers, and Axe.

There is some evidence that the rule and calipers were in use. The axe is a common feature, but the meaning of a "lat axe head" mentioned in the collection of medieval wills and inventories published by the Surtees Society is not clear.

In the little picture drawn on p. 17 b. of the British Museum MS. 18850 an unusual form of tool is depicted. Unfortunately, it is not represented as in use, but as lying on the ground. Its use and name we are unable to determine. It is similar in appearance to the tool used in putting down carpets, but with a much shorter handle. Its possible use might be for cleaning the face of ashlar.

For working upon stone one of the most common tools was that which is perhaps best represented by the bricklayer's hammer of to-day. At one end of the head was apparently the same cutting edge; the form of the other end it is not easy to determine. The practice for a workman to set the stone upon which he was working upon another block to raise it to a comfortable level was as general as it is to-day. Winches and various methods for the raising of weights were employed. Sometimes, however, a single large piece of worked stone would be carried up on the back of a workman.

Wheelbarrows.

The common form was almost exactly similar to that used to-day in English brickfields, being long, low, and without sides. For a mediæval representation of the barrow see the *Builder* for June 2. When loose material was to be carried it was apparently placed in a basket.

Baskets were in common use. They were large, with two handles opposite each other rising from the top.

It will be understood that the above is but an outline of the more common tools used by builders in the Middle Ages. Many of the finer tools used by painters, glaziers and glass painters, carvers and sculptors, and the heavier tools used by the masons, tilers, plasterers, and lime burners find no mention, so far as we know, in mediæval literature.

Our illustration is a reproduction of a XVth-century picture on p. 48 b. of the British Museum MS. 18193.

GENERAL BUILDING NEWS.**NEW CHURCH, RHONDDA.**

This church has been erected at Blanycwym from the designs of Mr. R. S. Griffiths, architect, Trefor, who is also a Town Councillor. The cost of erection was 1,000*l.* and the builder was Mr. E. J. Davies, of Treherbert.

NEW SCHOOL, GATESHEAD.

This school for infants, which is an addition to the existing school buildings, was opened last week, and has been erected from plans prepared by Mr. F. W. Purser, architect and surveyor, of Gateshead. The cost of erection was 5,650*l.*

NEW HALL, PRIARS GREEN.

This hall, which is being erected for the Independent Methodists, has been designed by Mr. S. P. Silcock, F.R.I.B.A., architect, of Warrington, and the accommodation provides for over 300. The contractors for the work are Messrs. Joseph Dolan & Son, of Warrington.

CONVALESCENT HOME, LEICESTER.

This new home for women is being erected on a site near Woodhouse Laves for the Leicester and County Saturday Hospital Society. The architects for the work are Messrs. Seale & Riley.

ALL SAINTS INSTITUTE, POPLAR.

This new building, situated in Newby-place, Poplar, the foundation-stone of which was laid by H.R.H. Princess Henry of Battenberg last year, adjoining the Town Hall and opposite to the fine Parish Church, was formally opened by the Bishop of London on Saturday, July 1. The building has been erected partly on the site of an old parochial school and partly on a portion of the rectory garden. It consists of—on the ground story, entrance hall and corridors, three club-rooms, a gymnasium, and a billiard-room on the first floor, a hall capable of seating 350 to 400 persons, with a stage and retiring-rooms. There are also lavatories and cloak-rooms. A kitchen is provided on the mezzanine floor for service in connexion with the various guilds and clubs now to be housed here instead of being scattered about the parish. The frontage next Newby-place is of Portland

stone and red bricks (Renaissance). The joinery throughout is of pitch-pine, polished. The floor of the ground story is of pitch-pine blocks, and that on the upper story of pitch-pine boards polished suitable for dancing. The building is lighted by electricity and heated by radiators (hot water at low pressure). Messrs. J. & W. Clarkson, of Poplar and Bloomsbury, are the architects, and Messrs. F. & H. F. Higgs, of Loughborough Junction, the contractors.

TRADE NEWS.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air pump," ventilators and air inlets, has been applied to Cynlais School, Ystradgynlais.

It is announced that in consequence of the death of the late Sir John Aird the businesses of Messrs. John Aird & Sons and the Westminster Construction Company, Ltd. (of which the late Sir John Aird was Chairman from its formation in 1899), have been amalgamated, and will in future be carried on under the registered style and title of "Airds, Ltd." The Chairman of Messrs. Airds, Ltd., is the present Sir John Aird, and the Managing Director Mr. Malcolm R. Aird.

The New Isolation Hospital, Conway, is being warmed and ventilated by means of Shorland's patent Manchester stoves with descending smoke flues, patent Manchester grates, exhaust roof, and special inlet ventilators, supplied by Messrs. E. H. Shorland & Brother, Ltd., of Failsforth, Manchester.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 TO 1909.

At Tuesday's meeting of the London County Council the following applications, under the London Building Acts, were dealt with (the names of the applicants are given in parentheses).

Wragby.—School (200 places); Mr. W. V. Dixon, Secretary, Education Committee, West Riding of Yorkshire County Council, Wakefield.

Writlington.—Proposed large number of houses for the Writlington Colliery Company.

York.—School, Camphow-lane; Mr. J. H. Mason, Secretary, Education Committee, York Town Council.

HOUSE AT LYNSTEAD, SITTINGBOURNE.

Although in building one endeavours to use the materials of the district, due consideration of economy, especially with regard to half-timber work, often compels the use of material foreign to local tradition. In designing the house at Lynstead the architect, Mr. W. Allen

and is in close communication through pantry to kitchen.

The study is separated from other rooms by long low hall with staircase adjoining. The first floor comprises four spacious bedrooms, bathroom, lavatory, etc.

LEGAL COLUMN.

The London Building Act.

A recent case heard at the Guildhall again draws attention to the difficulty of determining when, under the London Building Act, 1894, notice should be given to the district surveyors. The summons in this case was taken out under sect. 145 of the London Building Act, and the "work" being undertaken was the reconstruction or repair of part of the roof above a water-tank in some bank buildings. The defence was that this tank had been in place since the building had been erected in 1860, and that the woodwork having become rotten it was renewed. The District Surveyor contended that the roof had been entirely removed and reconstructed, only the old lead being put back, and that he was entitled to notice, as he was bound to see that the new roofing was composed of incombustible materials.

The magistrate dismissed the summons, presumably because he considered that no offence had been committed, or that the section under which the summons had been taken out had no application; but he allowed the defendants no costs. This seems an unsatisfactory conclusion, as if parties have been guilty of no offence under the Building Act it is hard to see why they should be mulcted in costs of proceedings under the Act. On the other hand, the Act should, of course, be rigorously enforced when its provisions apply. Sect. 109 appears to explain sect. 145, as it seems to exclude from the operation of the Act "necessary repair not affecting the construction of any external or party wall" and any repair which does not amount to an addition or alteration, but the various sections of the Building Acts are difficult to construe as a whole.

The Housing and Town Planning Act.

An important decision under the Housing and Town Planning Act has been given in the Chancery Division in the case of Rayner v. Mayor, etc., of Metropolitan Borough of Stepney. The plaintiff was the owner of two houses, and the Borough Council, acting on the

representation of the Medical Officer of Health, made a closing order under subsect. 2 of sect. 17 of the Act of 1909, prohibiting the use of the houses for human habitation, both of the houses at the time being let to tenants. By sect. 41 the Local Government Board may by order prescribe the form of any notice or other document, and "the forms so prescribed, or forms as near thereto as circumstances admit, shall be used in all cases to which these forms are applicable." The form prescribed for a closing order under sect. 17 subsect. 2 sets out in a note at its foot the terms of subsect. 5, which gives the owner of the dwelling-house in respect of which a closing order has been made a right of appeal to the Local Government Board within fourteen days. No appeal having been entered, the order became operative, and notices were served under subsect. 4 requiring the tenants to leave the premises. The plaintiff applied to the Borough Council to have the closing order determined, which application the Council refused under subsect. 6, and three months after the date of the closing order a notice was served on the plaintiff that steps would be taken under sect. 18 to order the demolition of the houses. The plaintiff had under both sect. 17, subsect. 6, and under sect. 18 a right of appeal to the Local Government Board; but, instead of so appealing, six days after the latter notice under sect. 18 had been served upon him he issued the writ in this action, claiming an injunction against the Borough Council. The ground of his complaint was that the closing order was irregular, and had misled him, as it contained no notice of his right to appeal. The Court held that it was intended by the note to the form of order that notice should be given of the very important right of appeal to the Local Government Board, and that it was material to the closing order, and the injunction was granted, and by consent of the parties the motion for an interim injunction was treated as the trial of the action, and the matter thus finally disposed of.

LAW REPORTS.

HIGH COURT OF JUSTICE, CHANCERY DIVISION (Before Mr. Justice EVE.) Eastbourne Building Dispute. Ellis v. Llewelyn.

In this case the plaintiff, Mr. M. Walter Ellis, of Harding Villa, Eastbourne, claimed an

House at Lynstead, Kent.
Mr. W. Allen Taylor, Architect.

Taylor, was fortunate in having for his use the timbers of an old barn, situated on the site and recently demolished. The old oak, in conjunction with dark brindled bricks and stained tiles, at once gave to the house the charm of the old Kent cottage, which was for its beauty as much to its weathered materials as to its design. The living-room, with dark beamed ceilings and recessed fireplaces, is one end partly screened off for meals,

interim injunction to restrain the defendant, Mr. Wm. Llewellyn, a builder, of Eastbourne, from building over or upon, or from using as a party wall, the western wall of the plaintiff's house, or from interfering with it except as defined by an agreement of February 24, 1911.

Mr. Beebes appeared for the plaintiff, and the defendant was represented by Mr. Adams.

Mr. Beebes said that on the west side of the plaintiff's house was a party wall which formed the boundary of the plaintiff's premises. The parties entered into an agreement on February 24, 1911, which defied what the defendant should be entitled to do with regard to the wall, while he was building a pair of houses on land adjacent to that of the plaintiff's. The agreement stated that the plaintiff should be allowed to build upon the western boundary wall of the plaintiff's premises and up against the wall of the house, and that the defendant should have the right to use that wall free of cost for all time. The eaves of the plaintiff's premises overhung the boundary wall (which was a party wall), and the defendant agreed to make certain alterations on this part of the plaintiff's property as a consideration for the plaintiff's concessions. The plaintiff's contention was that upon the construction of the agreement the western boundary wall was to be left standing, and that the defendant was to build on top of that wall. The defendant had, however, pulled down the boundary wall altogether, and built some fireplaces against the plaintiff's house, which were abutted on the boundary wall, and was using that wall as a party wall.

His Lordship: What is the width of your house?

Mr. Beebes: Nine inches. Under the agreement the defendant was not entitled to remove the wall without substituting another. The plans deposited by the defendant with the local authority bear out the construction which the plaintiff says ought to be put upon the agreement.

His Lordship: The exterior wall of the plaintiff's house is now the eastern wall of the defendant's house?

Mr. Adams: Yes. My client says that a 9-in. wall is the usual thing with houses of this class, and that the taking away of the wall does not affect the value of the plaintiff's property.

Mr. Beebes said that when the plaintiff had got 18 in., why should he give it up? It was a most unreasonable construction of the agreement to say that a 9-in. wall was sufficient. Counsel put in plans of the premises and read the evidence filed on behalf of the plaintiff, from which it appeared that the plaintiff would suffer considerable injury if the defendant built as he evidently intended, and used the plaintiff's house wall as a party wall. It was suggested that the defendant should build a new wall on the site of the boundary wall. The house had been built nine years, and on the western side was bounded by a garden wall 5 ft. in height and 9 in. in width, which was built some time before the house. The western side of the house wall was built close up to the boundary wall, and the eaves and gutter of the plaintiff's premises projected 9 in. beyond the boundary wall.

Mr. Adams submitted that under the agreement the defendant was within his rights in taking down the boundary wall and building as he had done. In his affidavit the defendant said that the written agreement was intended to give effect to a precise verbal agreement, and he denied that he had ever agreed to build the wall of his house on the boundary wall. He further said that an 18-in. wall was unnecessary and unusual in houses of this class.

Mr. Justice Eve said he was not asked to construe the agreement on the motion, which must therefore stand until the trial, the defendant in the meantime undertaking not to further build over or upon any part of the plaintiff's land. No other order except that the costs be costs in the action.

In reply to Mr. Beebes, his lordship said if the parties were ready and he could find the time he would endeavour to try the case before the Long Vacation.

KING'S BENCH DIVISION.

(Before the LORD CHIEF JUSTICE and a Special Jury.)

Lorden & Son v. The King.

THIS was a petition of right in which the suppliant was Mr. J. W. Lorden, trading as W. H. Lorden & Son, builders and contractors, of Upper Tooting.

The claim was for damages for breach of contract on the part of the War Department in connexion with a contract which the suppliant obtained from that Department of his Majesty's Government for the building of a military hospital at Shorncliffe and quarters for the sisters and staff of the hospital. There

was a further claim for extra work done, and for damages for delay caused by the servants of the Crown.

The claims were not admitted.

Mr. H. E. Duke, K.C., M.P., and Mr. G. Stuart Robertson were for the suppliant, while the Attorney-General (Sir Rufus Isaacs), Mr. Rowlatt, and Mr. Raymond Asquith were for the Crown.

Mr. Duke said the action was really between the contractor and the War Department. Mr. Lorden had for years been accustomed to carry out a great deal of work for the War Office and other Government departments, and for some years had been included in the list of contractors who were invited to tender for work to be done. In the beginning of 1903 the War Department desired to erect as part of the military buildings at Shorncliffe a place called the 'Families' Hospital, with an auxiliary building for the staff. Mr. Lorden was invited to tender, and he succeeded in obtaining the contract, which was somewhere about 8,000l. Terms were made in the ordinary way, and the work was entered upon. What Mr. Lorden complained of was that the War Department had not fulfilled their obligations under the contract. There were numerous questions to be decided, one being the great delay which the contractors suffered. The contract, for instance, was for a six-months' job. It was entered into in March, 1903, and should have been completed in September of the same year, but by reason of the delays which were occasioned it was not completed until September of 1909. The main question for the jury would be that connected with a road which the suppliant said he was promised, but which he had not got. The questions were subsidiary, and could be dealt with in another way. Mr. Lorden, shortly, was given to understand by the plans which were provided when he tendered for the contract that the War Department were making a road round the site which would be available by the contractors, and which would give easy access to the site. But as a matter of fact the War Department did not complete that road, but stopped the work, and the suppliant was left to labour on to the best he could. Eventually, at the invitation of the War Office, Mr. Lorden made the roadway. The building work, however, was disorganised, and they had to employ treble the number of labourers than would otherwise have been necessary. The absence of the roadway allowed an accumulation of water on the site which was at the foot of a declivity, and consequently the men were working in a swamp. In addition to that Mr. Lorden experienced great difficulty in stacking his material, and altogether the arrangements made were very frustrated. The three important questions were:

(1) Did the War Department represent that the road would be made?

(2) Whether the suppliant entered into the contract on the faith of that representation?

(3) Whether the contract was not made on the road when it was made, and so had no cause for complaint.

Mr. J. W. Lorden said he was the only partner in the suppliant firm. He had secured numerous contracts from the Government. When he examined the plans for the building in question he saw that a road was to be made round the site, and he understood from the markings on the plan that he would have the use of that road for his building operations. He reckoned that because he had not had the use of the roadway he had had to expend 3½ per cent. more for labour. By the Lord Chief Justice, witness said that if he had known that the road was not to be available, he would have examined the site much more closely, and made quite different arrangements.

Mr. Robert Olgar, estimator and surveyor to the suppliant, said he saw when he examined the site that the roadway would give a free access to the site for the stacking of the necessary material. That fact biased his estimate considerably. Later, when the work was commenced, he saw that the road was not made in accordance with the plan, a great deal of water had accumulated, and men were slipping about in the mud. Great difficulty was experienced in getting the materials to the site. Had he known that there would have been no roadway his estimate for the work would have been correspondingly higher.

Without hearing any more evidence, the Attorney-General said he was satisfied upon the evidence he had heard that, whatever the legal position might be, the contractor had based his estimate upon the understanding that the roadway would be made by the War Department. In these circumstances he did not wish to raise any further technicality, and Mr. Lorden should be paid what he had lost. The question of figures could be dealt with elsewhere.

His lordship said the decision by the Attorney-General was a wise one.

The hearing of the petition was then closed.

LONDON COUNCILS.

Berkhamstead.—Plans have been passed for Mr. J. G. Williams for three houses at Aldbury.

At the meeting of the Middlesex County Council on June 29 it was resolved that a Special Committee be appointed to go into the proposal to provide further accommodation for lunatics. The Asylums Committee presented a report to the effect that at the expiration of five years accommodation will be required for about 300 patients, and as it takes five years to complete and equip an asylum, it was desirable that the matter should now be considered.

Camberwell.—The tender of Messrs. Henry Woodham & Sons, Catford, at 2,559l., has been accepted for making-up part of Court-lane as a new street. Plans have been passed for Mr. A. Mullins for additions to No. 199, Southampton-street.

Hamstead.—Application is to be made to the London County Council for sanction to raise a loan of 15,000l. for additions and alterations to the Town Hall buildings.

Heston and Isleworth.—The following plans have been passed:—Messrs. Daniels & Son, storemen, High-street, Hounslow; Messrs. Hamilton, four houses, Jersey-road, Osterley; Mr. F. J. Fisher, alterations to the George and the Duke of Cornwall, Milford Arms, Labouring Boys, London Apprentices, Coach and Horses, Iron Bridge, and Checker's Inn, Isleworth, also Black Horse, Lampton, and Tankerville Arms, Hounslow. Plans have been lodged by Messrs. Hamilton for twenty-three shops in Thornby-road, Osterley, and ten houses, Jersey-road, Osterley.

Ilford.—Plans have been passed as follows:—Mr. E. T. Dunn, for Mr. A. C. Corbett, eight houses, Broomhill gardens, Ilford; Mr. H. Carr, four houses, Crat brook-road; Mr. A. T. Haines, three houses, Bradford-road; Mr. C. J. Dawson, for Mrs. C. Langman, one house and shop and ten houses, Ilford-lane.

Kensington. Messrs. Colcott & Hamp, architects, 36, Bloomsbury-square, are to be permitted to erect a building proposed to be constructed over the site of a brick barrel conduit at the rear of No. 47, Edwardes-square, subject to protective conditions.

Lewisham.—Plans and estimates by the Borough Surveyor have been approved for paving and forming as a new street Datchell-road, Perry-hill, at an estimated cost of 661l. The tender of Mr. F. W. Lowesby at 310l. has been accepted for alterations at the Town Hall and erecting office lavatory. The following plans have been passed:—Messrs. Norfolk & Prior, block of five shops, Perry-ale; Messrs. T. H. Sawyer & Son, additions to Nos. 120 and 132, Rushby-green; Messrs. J. Shorter & Co., four houses, Courtmill-road; Messrs. E. C. Christmas, additions to Dartmouth, High Church-road. A plan has been lodged by Mr. L. S. Rogers for nineteen houses, Woolstone-road.

Leyton.—The following plans have been passed:—Lea Bridge District Gas Company, extensions to offices, Lea Bridge-road; Messrs. Press & Co., warehouse, factory, and laundry; Mr. A. Low, three houses, Essex-road; Mr. P. Roche, six houses, High-road, Leyton; Mr. A. Radcliffe, five houses, Colchester-road; Mr. D. P. Hayworth, alterations and additions to laundry, Beaumont-road.

Mitcham.—Subject to the approval of a parish meeting the Council has resolved to provide a central fire-station at Upper Grove with first aid at Collier's Wood. The Council also approved plans and estimates prepared by Mr. Chart. The cost of the buildings is put at 1,630l.

Romford.—The Surveyor has been instructed to prepare a plan and specification, and tenders are to be invited, for extending the culvert in Slevins-lane, Hornchurch. Tenders are also to be invited for laying 855 ft. of bed at Chadwell Heath and 440 ft. at Great Warley.

Southgate.—The Local Government Board has sanctioned the borrowing of 3,375l. for erecting workmen's dwellings in Highfield-road. The Surveyor of the Council has had an interview with Capt. Taylor and the representatives of Messrs. Drivers, Jonas, & Co. with regard to the development of Grove lands Estate. An amended scheme was agreed to. The following plans have been passed:—Mr. W. Simmons, fourteen houses, Kelvin avenue, Bowes Park; Mr. W. Goring, twenty-five houses, Kelvin-avenue, Bowes Park, and two houses, Oakfield-road, Southgate; Mr. W. Dudley, building for electric lighting plant, Picture Theatre, High-road, New Southgate; Mr. R. Spence, eight houses, Avenue-road, Southgate; Messrs. Barker & Kirk, additions, Christ Church, Southgate.

Southwark.—Mr. Walter H. Hall, of Queen's-road, Finsbury Park, has been appointed Junior Surveying Assistant in the Borough Engineer's Department at a con-

encing salary of 80*l.* per annum, rising by annual increments of 10*l.* to a maximum of 100*l.* per annum. Fifty-seven applications are received.

West Ham.—The following plans have been issued:—Mr. W. Jacques, alterations to school, Maryland-point, Stratford; no alterations to school and caretaker's house, Denmark-street and Forty Acre-lane, West Ham; Mr. J. T. Luton, alterations to at and dumb church, East-road, West Ham, no fire brigade quarters, Stratford (4,190*l.*); Mr. H. W. Eastwood, house and office, Park-road, Silvertown; Mr. J. R. Moore-Smith, offices, workshops, etc., at Gas Lighting Improvement Company's premises, Crow's-road, West Ham, also factory at the Hart munition Company's premises, Marshgate-lane, Stratford; London General Omnibus Company, Ltd., alterations to garage, Green-reef, Upton Park; Mr. H. Simpson, alterations and additions, Gaiety Picture Palace, 3, Green-street, Upton Park; Mr. J. M. H. Adwell, alterations "The Cabin," 270, Victoria Dock-road, Custom House; Mr. G. Ingram, alterations and additions, Ruby Ale Stores, Scott-street, Canning Town; Messrs. W. Jones & Sons, paint and varnish store, Upper-road, Plaistow. The following alterations have been lodged:—Mr. J. M. H. Gladwell, alterations "Freemasons' Tavern," corner of Freemasons road and Victoria Dock-lane, Custom House; Mr. J. Rivett, alterations and additions, 3 and 5, Windmill-lane, Stratford; Mr. J. W. Kerrison, alterations to cinema-graph theatre, 127-31, Wytonstone-road, Stratford; Mr. E. Pratt, cinema-graph theatre, Willow-grove and Station-road North, West Ham; Mr. W. G. Garman, alterations and additions to the Ruby Ale Stores, Garney-road, Stratford; Mr. F. Bannister, match factory, Bradfield-lane, Silvertown.

Westminster.—Atterbury-street is to be paved with asphalt and concrete at an estimated cost of 125*l.* A plan has been agreed by Messrs. Perry & Co. (Bow), Ltd., for a building on the site of Nos. 28-30, Great Street-street, and Nos. 2, 4, and 6, St. Ann's-lane.

Willesden.—The Engineer is to be authorised complete negotiations for the acquisition of a large area of land, opposite the White Hart Hotel, Church End, and to submit detail plans and estimates for the erection thereon of conveniences for both sexes. He has also been directed to prepare detail plans and estimates of the cost of erecting conveniences for both sexes at the junction of Malvern-road and Canterbury-road with Canon-vale-road. Other plans are to be prepared for the construction of a sewer in Neasden-lane at an estimated cost of 220*l.*

PATENTS.

APPLICATIONS PUBLISHED.*

3,402 of 1910.—Julius Gotlob Zwicker: Sawing machinery for manufacturing cement pipes with loaded ends.

3,687 of 1910.—James Albert King: Mechanical steam-driven apparatus for the painting of surfaces of buildings or other structures and surfaces.

3,632 of 1910.—Melville Graham Clayton: Machinery for punching metal plates, bars, and the like.

3,922 of 1910.—Charles Wicksteed: Sawing-machines.

4,109 of 1910.—Frederick Ritter Von Rittberg: Riveting-machine.

4,439 of 1910.—Arthur Grosvenor Wilkinson and Thomas Conway Tomlinson: Roof glazing the like.

3,142 of 1910.—William Larmer: Chimney-pipes for the prevention of back-watering in sea drains.

4,012 of 1910.—Alfred Henry Stanbrough: Apparatus for moulding concrete walls *in situ*.

4,231 of 1910.—Mortimer Warren: Device for temporarily supporting venetian blinds and the like whilst being secured in position or moved.

3,552 of 1910.—Frederick Rings: Reinforced structures.

3,601 of 1910.—Alexander Roberts McLeod: Apparatus for the like.

3,979 of 1910.—Cedric Reginald Douglas: Direct and regulated water supply in one ball valve to a range, or ranges, of heating cylinders for water-closets and the like.

4,220 of 1910.—Robert Arthur Cowman and Robert Riley: Wall ties for reinforcing brick and concrete structures.

3,744 of 1910.—Mutter Kutner and Lubecius: Tiles for covering walls, ceil-

ings, and other places, and in the manufacture thereof.

3,283 of 1911.—Joseph Duffy: Wood flooring blocks.

7,487 of 1911.—Max Mannesmann: Building blocks.

SELECTED PATENTS.

2,238 of 1910.—Julius Heinrich Albert Wrisenberg: Floors.

This relates to a reinforced concrete floor of the ribbed type, which is formed *in situ* by means of sheet metal or pasteboard tubes *b*, which are laid in pairs on a plaster or like ceiling *a*, supported on temporary centering, each pair forming a permanent centering for

2,238 of 1910.

a rib. The reinforcements *f* for the ribs are supported by clamps *c*, and the ends of the tubes are flattened or closed by flattened members *g*. The floor slab *e* is cast with the ribs, sound-deadening material *h* being first filled in between the ribs and partly embracing the tubes.

2,911 of 1910.—James Albert King: Girders and columns.

This relates to girders and columns which are formed of rolled-metal joists surrounded wholly or partly by concrete or other fireproof blocks. The blocks *a* are grooved to engage the flanges, and cover the greater part of the web;

2,911 of 1910.

they are reinforced by bars *d*, *e*, the former being bent over the top flange. The ceiling slabs *h* and concrete floor *j* are supported by the blocks *a*, and the joints between the blocks and joists are grouted with cement.

2,865 of 1910.—Henry Howlett, Charles Edgar Howlett, and Stephen Joseph Howlett, trading as H. Howlett & Sons: Windows.

This relates to window-sashes which are reversibly pivoted on central, vertical, or horizontal pivots, and are raised, when closed, so that the top rail of the sash enters the groove in the head of the frame, by means of a vertically movable sill, which also operates weather bars at the sides of the window. The sash is pivoted on vertical pivots *a*, *f*. The sash *b*, when lowered for opening, is supported by a spiral spring *s* in a boss on a plate *n*, fixed on

2,865 of 1910.

the lower rail of the frame *a*, and is raised, when closed, into a groove *t* in the head of the frame by a plate *g*, bearing against the underside of the movable sill *e*, and raised by means of the handle and shaft *h* and eccentric *j*. The weather bars *a* are mounted in grooves at the side of the frame *a* by means of inclined slots working on pins in the grooves, and are operated by projecting plates *u* on the sill *e* bearing against the lower ends of the bars, so that when the sill is raised the bars are forced out into grooves in the sash stiles. The lower pivot pin *f* rests on the plate *g* while the upper pin *u* engages holes in the sash and frame, and

is raised, so that the sash can be removed by hand or by a tool inserted through an aperture *e* in the frame.

3,211 of 1910.—Karel Otto Slingsvoot Ramorrt and Ernst Jan Nellem: Doors.

This relates to revolving doors, the wings of which collapse and fold parallel to each other when abnormal pressure is applied, as in case of panic. The wings *11* are hinged to the central spindle *8*, and are held in the radial position by the engagement of yielding holding devices on the wings with a rotatable ring *4* mounted in the top of the door-casing, and provided with anti-friction rollers *5*, *6*. The wings

3,211 of 1910.

11 are yieldingly held in frames, secured to and rotating with the spindle *8*. Portions of the casing are also hinged and held in position, so that they fold back on excess of pressure, and means are provided for moving the wings when collapsed to the side of the door-casing. The holding means for the wings *11* and hinged portions of the casing *20* may consist of spring catches *13*, *14*.

3,723 of 1910.—Richard Henry Annison: Piles.

This relates to sheet piles made from simple or built up flanged members, and provided with points by bending the flanges down on to the webs, so as to produce a wedge like form. The flanges may be cut away a short distance from the bottom, leaving the web, which is bent up

3,723 of 1910.

either before or after bending down the flanges. The web *d* is bent and the flanges *e* are bent down over it. Solid wedges may be inserted under the turned-down flanges. Instead of turning up the web, a sheet of metal may be bent to embrace the bottom of the member.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residents in any part of the United Kingdom at the nominal rate of 1*l.* per annum, with delivery by *Express* at 1*l.* 10*s.* per annum, and to all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, &c., 2*l.* 10*s.* per annum. (Terms of sale payable to J. MORGAN) should be addressed to The Publisher of "THE BUILDER," 4, Catherine street, W.C.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xviii.; Auction Sales, xxiv.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair way of clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

JULY 31.—Lowestoft.—SCHOOL.—The Lowestoft Education Committee invite designs for an elementary school for 800 boys at Roman-hill. Three premiums are offered: 20, 10, and 5 guineas. See advertisement in issue of June 16 for further particulars.

JULY 31.—Wellington.—NEW PARLIAMENT BUILDINGS.—Premiums of 1,000l., 500l., 300l., and 200l. are offered for the competitive designs. Particulars from the Minister of Public Works, Wellington, New Zealand.

JULY 31.—IDEAL COUNTRY HOUSE.—100l. offered by the *Daily Mail*, Carmelite House, E.C., for designs for a country house, to cost from 3000l. to 1,100l. Mr. E. C. P. Monson, F.R.I.B.A., Mr. E. J. Sadgrove, F.R.I.B.A., and others assessors.

AUGUST 8. Egrement.—Premiums of 40l. and 10l. are offered by the Egrement U.D.C. for layout scheme. Particulars from the Town Surveyor, Egrement.

AUGUST 15.—Berne.—MONUMENT.—Designs for the erection of a monument at Berne to celebrate the foundation of the International Telegraph Union. Conditions may be seen in the library of the Royal Institute of British Architects.

SEPTEMBER 12-25.—Athens.—COURT OF JUSTICE.—An international competition is instituted by the Ministry of the Interior, for the erection of Court buildings, to cost 160,000l. The *Official Gazette* may be seen at the Library of the R.I.B.A.

SEPTEMBER 16.—Manchester.—LIBRARY AND ART GALLERIES.—Limited to ten selected competitors in the first competition. See issue of June 23, p. 730.

OCTOBER 30. Holland.—STAINED GLASS WINDOW.—Designs are invited for a stained glass window to be erected in the University at Groningen. See advertisement in issue of June 9 for further particulars.

OCTOBER 31. Marylebone.—NEW TOWN HALL. Premiums of 100l., 75l., 50l. The assessor is Mr. Henry T. Hare, F.R.I.B.A.

NOVEMBER 1.—City of St. Petersburg.—MONUMENT TO ALEXANDER II.—Particulars in our issue of August 13, 1910.

DECEMBER 25.—Glasgow.—DESIGN FOR A BRIDGE.—Designs are invited (Alexander Thomson Travelling Studentship) for a bridge. Premiums of 600l. and 300l. are offered. See advertisement in issue of December 24 for further particulars.

JANUARY 31, 1912.—Australia.—DESIGNS FOR FEDERAL CAPITAL CITY.—The Government of the Commonwealth of Australia invite competitive designs for the laying out of this Federal capital city. See advertisement in this issue for further particulars.

NO DATE.—Nottingham.—BAPTIST CHURCH AND PREMISES.—Limited to Nottingham architects. Particulars from Messrs. Barks & Jackson, solicitors, King-street, Nottingham.

NO DATE.—Salford.—Extension of office accommodation on workhouse site at Eccles New-road. Premiums 20l. and 10l. Particulars from the Board of Guardians, Salford.

circulation and the like, should these be received, they cannot (if
noticed) be forwarded.

AN EDITION PRINTED ON THIN PAPER, for FOREIGN AND
COLONIAL CIRCULATION, is issued every week.

READING CASES { NINEPENCE EACH.
By post (and duty paid), 1s.

PRICES CURRENT OF MATERIALS.

* * * Our aim in this list is to give, as far as possible, the
average prices of materials, not necessarily the lowest.
Quality and quantity obviously affect prices—a fact
which should be remembered by those who make use of
this information.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors. We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them, for publication or not. No notice can be taken of anonymous communications.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Tuesday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100l. unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

AN INTERESTING EXPERIMENT.

THROUGH the courtesy of an American correspondent we have received a comprehensive report of the developments that have followed the recent opening of the first instalment of the Protestant Episcopal Cathedral on the Morningside Heights, New York. This building, as our readers may be aware, was designed some twenty years ago by the late George L. Heins and his partner, Mr. C. G. La Farge, and the choir has recently been completed under the supervision of the last named. It

appears that without any warning the Trustees terminated Mr. La Farge's appointment and called in Mr. Ralph Adams Cram as their adviser. While our sympathy must be extended to an architect who will naturally be grievously disappointed in having to turn over his half-completed work to others, we are bound to admit that the Trustees appear to be acting within their legal rights.

Mr. Cram's action in at once communicating with Mr. La Farge, and in agreeing to accept the appointment only

if the American Institute of Architects ruled that in doing so he was not violating the ethics of the profession, is exactly what we should expect of him, knowing his keen sense of what is due from one architect to another.

This change, though likely to have an important influence on a building dominating the northern end of Manhattan Island, is not, in our view, the most interesting feature in the Trustees' action; it appears to be in reality subordinate to a scheme which, if put into

general practice, would revolutionise our architectural methods in regard to large and important buildings.

Read carefully the following statement by Dean Grosvenor, the Chairman of the Fabric Committee—

"This new cathedral is to be the biggest and finest ecclesiastical structure in modern times, with the single exception of the new cathedral of Liverpool. It is too big for one man. It is to be no one-man affair. It is to be such a structure as should have the fruits of the best minds in the world and the opinions of the greatest experts on ecclesiastical architecture in the world. It is to be made as fine and as beautiful as it is possible for such a structure to be made.

The determination reached by the Trustees to bring this to pass will result in the enlargement of the original plans for the cathedral. The Trustees have greatly broadened their views about it, and in this situation they have decided to appoint Mr. Ralph Adams Cram to be their consulting architect.

He is to act in this manner: For the coming additions to the building Mr. Cram will select the architect for the specific work with the approval of the Fabric Committee and the whole body of Trustees. There are to be no competitions. You may say for me that I do not approve of competitions. When the architect selected shall have finished his design he will submit it to Mr. Cram, who will reject it at once and direct another if he sees fit. However, if he thinks well of the design submitted he will lay it before the Fabric Committee. If this committee approves of it the design will then be laid before the Trustees in a body, and there final action will be taken."

We do not think we are overstating the case in describing the suggested method as revolutionary in its character; though, however great the departure from recognised practice in the present day, the genesis of the idea underlying it may be easily traced. A study of most of our old buildings reveals the fact that much of their charm is due to their being the work of many hands, and it is doubtless with a view to recapturing that form of interest that this attempt is being made to introduce the work of a number of men into a single building. That the experiment is an interesting one must be admitted, but whether the results will justify it is more doubtful. In the hands of Mr. Cram it will have the best possible chance of success, and if it fails it can only be from some inherent weakness.

To our mind there appears to be a curiously artificial atmosphere about the proposal, which will probably result in some corresponding artificiality, but thinly disguised, in the building, so that it will obviously, to the trained mind, only simulate and not reproduce the charm of those old buildings on which successive generations have laboured. We may be wrong, indeed for the sake of New York we trust that we are, but the feeling remains that the spirit of our time is too remote from that of the Middle Ages for any attempt at imitation of medieval methods to achieve its end, and that, while our architects are in the habit of working on the lines of the later Renaissance, the mere fact that some have trained themselves to express their imaginings in the Gothic manner will not enable them to recreate the more subtle characteristics of those times, least of all in such an environment as that of New York.

The danger will be that this important work may lose the homogeneity so essential to a fine building without achieving the compensating quality of varied interest that is so evidently in the

mind of those controlling its destinies. However, America is the land of bold experiments, and perhaps it may be as well if one more is added to the striking record it may already claim of experiments in religion, in law, in education, in construction, and in other directions too numerous to recite. Experiment is the outcome of mental activity, and perhaps an occasional failure is not too high a price to pay for the results that attend a fearless attitude in face of all the problems of life and art.

THE AMERICAN ACADEMY IN ROME.

IN view of the schemes, still more or less in the air, for the establishment of a British Architectural School at Rome on the French model, it is not uninteresting to learn what the Americans are doing in this direction. The last quarterly Bulletin of the American Institute of Architects throws some light on the matter. The American Academy in Rome has for some time been an established fact, and this institution, it appears, has now been strengthened by a union with the American School of Classical Studies. There will, therefore, now be two schools within the Academy—a School of Fine Arts and a School of Classical Studies; and, as the Bulletin states, the Academy will represent America in Rome in all branches of artistic and classical culture. The word "culture" is still dear to the heart of your cultivated American.

The history of the American School of Architecture possesses some interest. It was, in the first instance, organised by a group of artists, sculptors, and painters who were engaged in planning the Columbian Exposition, and was inaugurated in the Villa Aurora in 1895. During the first fifteen years of its existence the artists contributed over 15,000*l.* for its support, which indicates their estimate of its value in the development of American art. Beginning with an architectural department, this was soon followed by a department of sculpture and painting, and the Academy became incorporated by Congress as a national institution. Until a certain income was secured through several subscriptions of one hundred thousand dollars each to the Endowment Fund the students in the Academy were beneficiaries from various scholarship funds, but for the past four years competitions have been instituted throughout the United States in each branch of the fine arts, and the successful competitors have been sent to the Academy for three years with an annual subvention of one thousand dollars. Down to the present time sixty-four students have pursued their advanced studies at the Academy, many of whom have already attained high rank in their several professions. In addition to these competitive students there have been in residence at the Academy at various times the holders of the McKim Fellowship and many scholarships in the possession of Harvard and other Universities and schools. There are at present nine Academy Fellows in residence and two holding other scholarships.

The national interest in the school is in a measure indicated by the fact that among its most liberal supporters have been Mr. Pierpont Morgan and other wealthy patrons of the arts, while the sum of a hundred thousand dollars has been raised as a memorial to Mr. McKim. This distinguished architect manifested during his life the greatest interest in the Academy, to the establishment of which he devoted much time and effort, and, further, by the provisions of his will he bequeathed to it a sum of about two hundred thousand dollars subject to the life interest of his daughter. Notwithstanding the strong financial backing which the Academy has received from all quarters, it appears that much larger resources will be needed for new buildings and endowments to enable it to take full advantage of the opportunities which are now open to it. It may be gathered, therefore, that the foundation and adequate working of an art school of the kind is a matter of some cost.

The scope of the newly-organised Academy covers a larger field than that of architectural study alone. It recognises, first of all, the unity of the arts of architecture, painting, and sculpture. The failure of the American educational system to co-ordinate these arts is admitted. It is hoped that the present foundation, placed in a centre where such unity finds its highest expression, will not be without effect on the artistic outlook of its Fellows and students—an effect which later will be manifested no doubt in the general levelling up of the art production of the United States.

NOTES.

St. Paul's Bridge.

WE very much regret to see that the City Corporation has succeeded in obtaining the approval of the Select Committee in its attempt to again rush its scheme through without sufficient time or opportunity being allowed for its adequate consideration from every point of view involved. We should have thought that the onus would lie on the promoters to prove first of all the soundness of the object they have in view, and then afterwards to prove the correctness of the method whereby they propose to carry it out. We have so far seen no attempt to prove that this is the right place for a through traffic route. This seems to have been taken for granted, and upon this assumption the whole of the promoters' case is built. Yet this is precisely the point which is open to grave doubt, and from a town-planning point of view the assumption appears unwarranted. The Select Committee does not appear to have called for traffic maps or traffic statistics, or anything in the nature of evidence to prove that a through traffic route must be situated at this precise spot. They seem to have taken it all for granted, and the Corporation was allowed to throw the onus of proof on their opposers, and to confine themselves to attacking any tentative suggestions that might have been put forward, and to showing how dangerous a tramway tunnel would be if put where it would not be necessary to put it, and where, so far as we know no

one proposed to put it. In our last Review of Civic Design we pointed out some of the objections to this position as a through traffic route and the obvious advantages of Blackfriars as a main north and south artery, but such points as those we raised do not appear to have been thought worth consideration.

If we may judge from St. Paul's : the evidence as reported, The Evidence. the three architects who appeared before the Select Committee seem to have been consulted only on the method whereby the object of the Bill is to be carried out, and not as to whether this object is in itself a reasonable one and the best town-planning solution imaginable of the traffic difficulties which gave rise to the scheme. Granted the necessity of a through traffic route at this exact spot, and granted that this is the one important factor that should dominate the scheme, there is a good deal, no doubt, to be said for the way in which the Corporation propose to carry it out, and it is quite proper that the Corporation should ask these architects to point out its advantages to the Committee. We now know all there is to be said in favour of this scheme, and we must confess we are not greatly impressed. But, as we said before, it is just this necessity for a traffic route at this spot which should not be taken for granted, as no proof is forthcoming. Neither have we any proof that the three architects are agreed that this is the best possible scheme imaginable. On the contrary, Mr. Colcutt is reported to have expressed the opinion that if it were possible to construct an axial bridge and approach to St. Paul's he would consider that the best scheme that could be put forward. We have seen no proof that such a scheme is impossible, neither have we heard that the Corporation has requested Mr. Colcutt or anyone else to endeavour to work it out. The whole matter is summed up in a question reported to have been put to Mr. Colcutt. "In short, you think it easy to find out a better scheme than that which is put before us to-day?" The whole case for the opposition is contained in Mr. Colcutt's reply, "I do." Until the Corporation, by competition or otherwise, make an honest endeavour to discover that scheme, they cannot be said to be acting up to their expressed intention of doing the best they can for London, and we can only hope that Parliament will again take a different view to that of the Select Committee.

As Others See Us. The new English stamps are described by the London correspondent of the *Corriere della Sera* as "simply the most vulgar and most depressing of all existing issues. The predominant note is economy, though against economy *per se* there is little to be said, but in this case the King's head lacks character, and might equally be that of the Tsar of Russia or any other gentleman with a beard. Nor is this the only failure in the design of these ugly English stamps, bearing only the inscriptions halfpenny, one penny. Who could possess a soul so void of the spirit of art and poetry as to put in circulation in the vastest Empire in the world, from the very heart

around which half the human race revolves, a design conceived on a purely monetary idea?" It is well to see oneself occasionally through other eyes; we were prepared to criticise our new stamps from the point of view of the decorative designer, but it is of more value that we should be made to realise, in a broad and comprehensive way, what a stamp should mean as one of the methods of expressing national characteristics and aspirations.

THE Board of Education in its circular issued on June 29 expresses the intention of terminating the present method of examining for art class teachers' and art masters' certificates next year, and of substituting tests, not at present specifically defined, that would demand a more comprehensive general education and artistic attainments less stereotyped in their character; these tests to be combined with a suitable course of professional training. The intention of the Board appears to be excellent, and we shall await with interest the publication of a detailed scheme. At the same time we should hope that there will be no attempt to substitute for a high standard of technical achievement an inferior one supported by a smattering of knowledge extending over too wide a range. The arts are already, in this country, too much under the domination of the glib-tongued dilettanti, and if the latter gentlemen are to receive official recognition into the bargain we shall suffer still further from their operations. There is a real danger in this direction, and the Board of Education will do well to bear it in mind.

L.C.C. Cottages Purchase Scheme. The Housing Committee's recommendation to the London County Council that it should apply for Parliamentary powers to sell its cottages on building society methods marks a fresh development of municipal enterprise. We see no objection, on principle, to a body empowered to build and to let houses also having powers to sell on such terms as may suit it and the purchaser. There is undoubtedly an increasing tendency towards thrift in our working classes, and further opportunities for the gradual investment of savings would encourage this. Without a doubt London County Council property is well built, but whether it can be built cheaply enough to compete with the private speculator from the buyer's point of view has not yet been tested. It can be let at a reasonable rent because of the strong position of the London County Council as borrowers, but other factors have to be taken into account when it is a question of selling.

Carnarvon Castle. CARNARVON CASTLE, the scene of the Investiture of the Prince of Wales on Thursday, is an ancient and picturesque fortress which bears striking testimony to the permanence of the work of its XIIIth-century builders. That it is in such a remarkably good state of preservation after so many hundreds of years and after so much active service is very satisfactory: for its suitability for the recent high ceremony was unique. The historic building in which with all spectacular

pomp and traditional sentiment the King presented his son to the people of Wales is a type of mediæval fortification which has distinct architectural qualities: for instance, it reveals its purpose at first sight. It was designed to be impregnable against all known engines of war, and, although gunpowder began to be used about the time the building was completed, the walls were solid enough to defy the efforts of all those who attacked in succeeding centuries. Time, more than "villainous saltpetre," as Shakespeare called it, has been the most persistent agent of destruction, and, thanks to the weight of the structure, its disintegration has been slow. The Castle still presents a formidable appearance, and, as may be realised from Mr. Monk's dignified etching (p. 31), its grim but not unlovely walls dominate scenes of activity on the Menai Strait and the River Seiont, which are not very dissimilar from those associated with the Phœnicians and the Romans. Inside, renovations have been made under the care of the Office of Works, and its appearance throughout is a tribute to the skilful blending of ancient and modern methods of construction.

THE NEW ST. PAUL'S BRIDGE.

ON Tuesday a Select Committee of the House of Commons, presided over by Mr. Mooney, commenced the consideration of the Bill for constructing a new bridge across the Thames from the south side to St. Paul's and the widening of Southwark Bridge. The scheme has already passed a Select Committee of the House of Lords.

At the outset of the proceedings the Chairman said he had received a letter from Professor Beresford Pite offering to give evidence against the Corporation scheme. Under ordinary circumstances he would not have any *locus*, but he thought that the Committee would like to hear what Professor Pite had to say.

Mr. Honoratus Lloyd, K.C., on behalf of the Corporation, said he thought the most convenient arrangement would be for him to shortly state the course he intended to pursue, and then Professor Pite could go into the witness chair. In accordance with the instruction of the House the Corporation had consulted some very eminent architects in regard to the scheme—Sir W. Emerson and Mr. T. E. Colcutt, Past-Presidents of the R.I.B.A., and Mr. J. J. Burnet, F.R.I.B.A. He intended to call those gentlemen before the Committee. He had also hoped to call the Engineer to the Dean and Chapter of St. Paul's, Mr. A. J. Barry, but he had been called abroad. Mr. Barry had written the following letter to Mr. Basil Mott, the engineer to the scheme:—"In reply to your letter of the 27th inst., in which you inquire what my views would be as regards the possible damage to St. Paul's Cathedral if a tramway subway were constructed nearer to the south side of the Cathedral than shown on the plans that have been discussed between us, I beg to say at once that I should regard with the gravest concern any proposal that would involve the excavation of the subsoil nearer to the Cathedral than as shown on the plan you submitted to me, more particularly if such disturbance of subsoil took place on the south side of the Cathedral. After discussing with you the maximum depth to which the foundations of the tramway subway as proposed to be constructed under your Bill of this year should be carried, the horizontal distance of the same from the foundations of the Cathedral, and after agreeing on certain protective works to be carried out before the proposed excavations were commenced, we eventually agreed with you in certain clauses for the protection of the Cathedral. In consenting to the disturbance of ground, even in the situation as then proposed, we were not without some

misgivings, and in accepting the clauses which were finally agreed, we were actuated by the desire not to interfere, if possible, with a work of great public importance. We were influenced, too, by the fact that the proposed excavations for the tramway subway would only affect that part of the Cathedral foundation which carries the least weight and is most secure. When you inquire what my views would be as to the possible damage to St. Paul's if the subway were constructed nearer to the south side of the Cathedral, I presume you have in your mind the construction of a tramway under St. Paul's Churchyard from the point about opposite to the centre of the south transept window eastwards and round the east end of the Cathedral. I have no hesitation in saying that, from an engineering point of view, I should regard the carrying out of such a proposal as certain to cause the most serious damage to the structure of the Cathedral. The main dome is, as perhaps you know, carried on four main corner piers, in addition to eight intermediate ones. The four piers on the north side have settled very little. In every case the piers carrying the south segment of the main dome have settled considerably more than any of the others. The south wall of the west transept has developed serious cracks, and there has been a general movement or draw of the whole structure towards the west and the south. This is evidenced by numerous cracks in the building and by the fact that the south wall of the building is already out of the vertical. Generally, I regard this part of the Cathedral as already being in a state of comparatively unstable equilibrium, and I should regard a far less serious disturbance of the subsoil than that which would be involved by the construction of so large a work as a tramway subway as close to the south wall of the building as, I understand, is proposed as entirely unpermissible in the interests of the security of so important a public structure as the Cathedral."

Mr. Lloyd then read the following report to the Corporation, signed by Mr. Emerson, Mr. Collett, and Mr. Burnet:—

"7, Grosvenor-mansions,
76, Victoria-street, S.W.,
July 7, 1911.

To Sir James Bell, Town Clerk, Guildhall. Dear Sir:—We have now completed our inquiries and consultations, and have the honour to reply to your letter inviting our opinion and advice in respect to the instruction of the House of Commons to the Committee on the Corporation of London (Bridges) Bill "not to agree to any scheme for the construction of the proposed new bridge, including the approaches thereto, until they are satisfied that the scheme, both in respect of architectural design and convenience of traffic, is the best adapted to the public needs and best suited to the character of the site."

2. We construe the words "the scheme" in the instruction as meaning the official scheme of the Corporation or any alternative scheme for a bridge to open out at or near St. Paul's Churchyard, which is the "site" in question. We have considered the scheme and also some other suggestions. The instruction opens up the three questions of:—(a) The best adaptation to public needs; (b) appropriateness to the character of the site; and (c) architectural design.

3. We accept as essential conditions for a satisfactory scheme the following requirements:—(1) That the projected bridge must have its roadway at the level above high-water mark shown upon the section; (2) that the linking of the northern and southern tramway system is an integral part of any scheme; (3) that the roadway from the bridge must be carried as a bridge over Queen Victoria-street.

4. As to (a) adaptation to public needs, the object of the Bill is to relieve the congestion of traffic between south and north over London, Southwark, and Blackfriars bridges, from a point in Southwark, near Marshalsea-road, direct to the main traffic roads to the north *via* Aldersgate, and to offer facilities for connecting the tramway systems on the south with those on the north. After the most careful consideration, both separately and in frequent consultation of various suggested or possible routes, and study of the general plan of London roadways and

contemplated tramways in the neighbourhood of St. Paul's, we are of opinion that the line of route proposed by the Corporation is best adapted to the public needs and to fulfilment of the objects of the Bill.

5. As to (b) appropriateness to the character of the site, we would point out that in the Corporation scheme the situation of St. Paul's in the relation of its line of axis to the central line of the river is not a factor. The area of the Churchyard would be increased, and there would be no consequential obstacle to the consideration of future improvements of the Churchyard. Moreover, better views of the Cathedral would be secured on the only side on which this can be done, without disturbing the picturesque charm of present surroundings. There is the further point of great practical importance that, owing to the depth of the Cathedral foundations and the quality of the subsoil, it is only on the eastern side of St. Paul's that a subway for tramways can be constructed above the level of the foundations without menace to the structure. (It is understood, of course, that the subway is not to be deeper than shown on the section.) Having carefully considered these points and all the surroundings of the site, we are of opinion that the alignment proposed by the Corporation is the one best suited to the character of the site.

6. In respect to (c) architectural design, we are in complete accord with the opinion of the Council of the R.I.B.A., that an architect or architects should have been appointed to collaborate with the engineers as to the general design of the bridge and its approaches when the scheme was initiated. In making this observation the Council of the Institute were undoubtedly actuated by the desire—shared, of course, by the City authorities—that a fine monumental bridge of masonry should be erected. In skilled hands the bridge and its approaches can be made a magnificent addition to the river scenery about the City.

7. Since the scheme was published side issues have been raised as to the "opening up" of St. Paul's. At first sight, and without detailed expert scrutiny, the idea that the opportunity might be taken to open up a vista terminating in the south transept of the Cathedral is attractive. The project shown by black lines on the plan has appealed to some architects and to a section of the public, and there has been a tendency to subordinate the main purpose of the new avenue of traffic between north and south to what would at the best be a subsidiary aim. In considering the project three points of great importance have to be borne in mind. They are:—(i.) The alignment of the bridge in relation to the river, since the proposed vista would only be obtainable by the building of a skew bridge; (ii.) the width of the northern approach to the Cathedral; (iii.) the possibility of future river embankments being constructed below Blackfriars.

8. We are of opinion that the suggested alignment is not good, and that, as it would be almost impossible to make a satisfactory monumental design for such a skew bridge in masonry, it is probable that the bridge would have to be of steel—a contingency which the R.I.B.A. evidently wish to prevent. There is strong presumptive evidence that Wren did not design the side elevation of the Cathedral to be looked at from any great distance. This is shown by the bolder treatment of the west front and of the dome as compared with the comparatively superficial ornamentation of the other wall surfaces. And in this matter the great architect followed the best traditions of his profession. We know of no famous public building, either here or on the Continent, in respect to which it has been considered necessary to arrange great roads leading to the side of the structure. Wren evidently did not contemplate such approaches in the case of the Cathedral, but he did contemplate a wide road at the east end, and that he was capable of taking large views as to future requirements was shown by his well-known plan for the rebuilding of London. We may add that the Greeks' great artists—took especial care that the Parthenon should not be approached by a road leading directly up to it.

"I am of opinion that it would be possible to construct a bridge over the river giving a vista of St. Paul's, which I should much prefer if found practicable. (Signed) T. E. COLLETT.

9. Further, it is to be observed that views not less interesting than the suggested "vista" will be opened up by the roadway proposed by the Corporation, and that it would not prevent improvements subsequently being made, if necessity arose, in connexion with a general scheme for improvement of the Churchyard. We wish it to be clearly understood, however, that, in our opinion, there is a limit to such "improvement," and that to exceed it would be to place Wren's design at a positive disadvantage by bringing it under conditions it was not designed to meet. But such limit would not be exceeded by the improvements the proposed Corporation route would effect, and facilities would be offered for opening up picturesque views of St. Paul's which have hitherto been obscured.

10. While it has been no part of our duty to examine with care the financial aspects of the conflicting schemes which have been the subject of public discussion, we feel it right to say that we have been impressed by the extent to which the "vista" scheme would involve altogether heavier expenditure out of all proportion to the Corporation project.

11. With respect to the suggestions we are asked to make, we agree with the Council of the R.I.B.A. in their recommendation that architects should collaborate with the engineers in the designs for the bridge, the archways over Queen Victoria-street and Thames-street, and the approaches as well as the accesses from the lower and higher levels, and in the debouchment of the roads. If the general scheme is passed by Parliament we advise that such architect or architects should be appointed.

12. We submit the following suggestions for improvement of the scheme as shown on the plan:—(1) That where the bridge road debouches on to Cannon-street it should be opened out as much as possible within the lines of deviation, and that the corner building to the south-east of Old Change be also acquired, thus opening that corner towards St. Paul's. (2) That the building frontage along Old Change should be no nearer to the east end of the Cathedral than at present, any future buildings following that line, and that the whole of the existing buildings between St. Paul's and Old Change should be removed. (3) That at some time the property now obscuring the south end of the Post Office in St. Martin's-le-Grand be acquired, and the space opened up and arranged so that a fine suitable architectural feature might centre on the line of the new bridge. If this were done it would also be possible for Foster-lane to somewhat relieve the traffic by St. Martin's-le-Grand. These alterations would give views of both the south-east and north-east sides of St. Paul's not hitherto obtainable. Further, ample space would be provided for the traffic at the road junctions, and right-angled crossings would be avoided."

Mr. Lloyd, commenting on the three suggested improvements of the scheme, said that the buildings mentioned in the second suggestions were already within the limits of deviation; whilst numbers two and three were improvements which were not within the scope of actual approach, but they were improvements which the Corporation had in contemplation and would no doubt be carried out.

Professor Pite then stated his objections to the scheme. He said that in the first place the proposed new wide thoroughfare did not combine architecturally with the great monument, St. Paul's Cathedral, which was practically the central object in the City. There was a want of definite architectural relationship between the great causeway and the Cathedral. That he should describe as an objection to the plan. There ought to be some architectural connection between the new thoroughfare and the Cathedral. The shape of St. Paul's Churchyard was very irregular. If it was squared up all the way round, a geometrical relation might be created between the new road and the rectangular building in the centre. He urged very strongly that the direct line of the road had a necessary connexion with the building, and that had not been provided for in the scheme. Another great objection he had was to the aspect rather than to the plan. The aspect of St. Paul's was that interesting architectural "crown" which it made in every

view of the City. That was an asset of very great value. His alternative suggestion was a "skew" bridge, and he did not see that there was any artistic objection to the relationship of the piers beneath the bridge to the direction of the road upon the bridge. The treatment beneath a bridge became a matter of very great interest, and could be made a great artistic improvement. In many kinds of arching and vaulting those problems could be made the very life of the subject. The scheme of the Corporation was so partial that it was rather difficult to form a correct opinion as to its effect. It created a wide causeway only so far as the bridge itself was concerned. The Corporation scheme was very drastic as far as the east side of the Cathedral was concerned, but he submitted that in dealing with the matter they ought not to question the north and south sides. Some distribution of the large capital expenditure upon the east side would give them an architectural lay-out on the north as well as the south side, which would be of very great value to London.

Replying to Mr. Forbes Lankester, K.C., Professor Pite said that to a large extent it was true to say that he had approached this matter as an opportunity which afforded itself for opening out St. Paul's, and he looked at the question mainly from the artistic point of view. At the same time, he would not question the desirability of affording facilities for traffic should come into consideration. He thought that large sums of money should be spent in opening up views of St. Paul's, and as far as the Corporation's willingness and courage in dealing drastically with the east side of the Cathedral was concerned they had his blessing. His suggestion, however, was that it were a little less drastic with the east side and took into consideration the other characteristics of the site they would see that the north side ought not to be omitted from consideration. He did not agree that a "skew" bridge would be difficult to construct, and he saw no objection to such a bridge either from a utilitarian or artistic standpoint.

In reply to the Chairman, witness said the only additional cost of his alternative scheme would be the cost of acquiring the warehouse of Messrs. Cook, Son, & Co. In regard to the question of the tramway, if the engineer was to say that under no circumstances must they allow trams to come where it was suggested they should, he would say, "Don't take the risk. St. Paul's is worth more to us for centuries than tramways are for generations."

The Chairman read a letter which he had received from the R.I.B.A., dated July 4, in response to a communication he had sent asking whether the Institute would like to give evidence at that inquiry, in which it was stated:—"The announcement of the Corporation appointing three eminent architects to advise them on their proposals entirely meets the view of the Institute. Now that these gentlemen are appointed the Institute has no further views to express in the matter."

Professor Pite said he quite agreed with the action which the Institute had taken. The Corporation having consulted architects of sufficient eminence to advise them, the Institute could not and would not challenge as a matter of personal opinion the position of any of its members, good or bad.

Sir W. Emerson, in reply to Mr. Forbes Lankester, said he did not agree with Professor Pite that it was possible to make a fine architectural monument with a "skew" bridge. Such a bridge could be carried out in masonry, but he thought they would find the difficulties so great that they would have to build it either of steel or reinforced concrete.

Questioned as to the improved vista which Professor Pite thought would be given of St. Paul's if his scheme was adopted, witness said he considered it would be going out of the way to make a strained effect. It would destroy a great deal of the mystery of the Cathedral and the charm of it. The removal of the buildings between Old Change and St. Paul's would give a very fine north-east and south-east view of the Cathedral.

Mr. Forbes Lankester said he might say at once that the Corporation were prepared

to accept the suggestion in the report, and to remove the old buildings between St. Paul's and Old Change.

Sir W. Emerson remarked that that would make a great difference to the view.

Mr. T. E. Collcutt, F.R.I.B.A., said he had taken great interest in the question before the Committee, and was one of the architects who went to the Corporation as a deputation on the matter. His objection to an 80-ft. roadway leading up to the south transept of St. Paul's was that on either side of the new roadway there would be buildings at least 80 ft. high, and to get a proper view of the dome and a proper effect of the vista the whole of the dome should be disclosed. Looking at it from that point of view, he should consider that the best plan which could be adopted would be a road some portion of which should be at least 160 ft. wide. He should say that from Queen Victoria-street, for instance, to the south transept the road should be at least 150 ft. or 160 ft. wide to get a proper view of the transept and dome of the Cathedral. He quite saw that that would involve enormous expense.

Mr. J. J. Burnet, F.R.I.B.A., gave somewhat similar evidence. He said that if the bridge was built, as the Corporation proposed, leading up to the east-end of St. Paul's, it would give anybody approaching the Cathedral the idea that it stood upon a hill, and that was why he approved of the route.

Evidence having been given in support of the Bill by Mr. Leslie Vigers and Mr. Basil Mott, engineer, the Committee adjourned.

Resuming on Wednesday, Mr. Fitzmaurice, the Chief Engineer to the London County Council, gave evidence bearing on the practicability of the proposed subway tramway in connexion with the new bridge.

Mr. Somers Clarke, architect to the Dean and Chapter of St. Paul's from 1897 to 1909, said the wall of the south transept of the Cathedral was about 110 ft. or 112 ft. long and 10 ft. thick, while the footings must be 120 ft. high. They had gone east and west in its length, and in parts they were broken through the thickness up to the top and extending some distance down. There was evidence of sinking having taken place from the very early history of the building. It was obvious from the area over which the footings were spread that Wren himself was aware of the difficulties which were likely to arise. The footings of the Cathedral laid upon a layer of peat earth of a depth of 18 ft. below the present level of the streets. Underneath that there came a layer of about another 18 ft. That got down into the gravel, which was not very solid stuff, standing upon the London clay, and at the bottom the stuff was very loose and there was a stream of water. There was evidence on the face of the building itself of settlements having taken place from time to time, and very soon after the Cathedral was built. There was very strong evidence of settlement upon the face of the south tower. The top of it was 18 in. out of the vertical, and the dome mass was broken away from the choir. They had no reason to think that those movements were at an end. He had seen the evidence of water having been taken away from the foundations when deep excavations were going on in the neighbourhood. He regarded the suggestion of bringing a subway tramway at the south side of St. Paul's as a very dangerous one, and he would refuse to be responsible for such an undertaking.

Mr. Riley, Superintending Architect to the London County Council, said he could not suggest any point which would justify the Committee in making any change in the alignment of the proposed new street.

Mr. Balfour Browne, K.C., having addressed the Committee on behalf of Messrs. Cook, Son, & Co., whose premises would be interfered with if Professor Pite's alternative scheme was sanctioned,

The Chairman, after the Committee had consulted in private, said:—"The Committee are of opinion that the scheme for the construction of the proposed new bridge, including the approaches thereto, is both in respect of architectural design and convenience of traffic the one best adapted to the public needs and best suited to the character of the site, and will report accordingly to the House."

The following admirable letter, which appeared in Thursday's *Times*, will be read with interest:—

To the Editor of the *Times*.

SIR,—In paragraph 8 of the consulting architects' report, given in the *Times* of to-day, the architects support their opinions by certain remarkable statements. They say:—"There is strong presumptive evidence that Wren did not design the side elevation of the Cathedral to be looked at from any great distance." It would be interesting to know on what authority the consulting architects base this statement. The river existed 250 years ago for Wren not less than for us to-day—far more so, indeed, as in his day the river was not obstructed by buildings in St. Paul's churchyard of a banality that Wren could never have believed to be possible. As a matter of fact, in Wren's plan for rebuilding London a street is shown nearly at right angles to the south front; but, apart from this, Wren's plan for the rebuilding was made in 1668, and even the "warrant" design for St. Paul's was not completed till 1675.

1. The consulting architects further contrast "the bolder treatment of the west front and of the dome" with the "comparatively superficial ornamentation of the other wall surfaces." Surely these gentlemen in preparing their report must have omitted to study the south front of the Cathedral. By no stretch of imagination or the boldest misuse of language can the south front, with its Loggia of Corinthian columns, its pediment and rich decoration, be described as "superficial ornamentation"; and one would hardly have expected "eminent architects" to separate the dome from its substructure. That great design stands or falls as a whole.

2. The architects, stating that it has not been considered "necessary to arrange great roads leading to the side of the structure," say that this practice is one of "the best traditions of the [architect's] profession." It is nothing of the sort, but the consequence of the simple fact that the principal entrance to our Western cathedrals is at the west end, and it is merely common sense to approach directly the principal entrance in preference to others. The case does not occur where a cathedral stands in a large open space, and probably any architect, if given the choice, would prefer that his church or cathedral should be well seen from every point. Sir William Emerson suggested that "a great deal of the mystery and charm of St. Paul's would be destroyed by a long approach." One can understand the charm of the picturesque little buildings that sometimes nestle between the buttresses of the great Gothic churches of France and elsewhere, but the existing buildings of St. Paul's churchyard—

3. The architects, in support of the Corporation scheme, quote the Greeks. They say:—"We may add that the Greeks—great artists—took especial care that the Parthenon should not be approached by a road directly leading up to it." Why drag in the Greeks to support a foregone conclusion on a problem in which nothing that they did has the slightest bearing? It is true that when the Greeks rebuilt the Parthenon they did not bring their road directly up to it, but it is perfectly well known that, at the date when the Parthenon was built, the position of temples had nothing to do with questions of axis lines, but was determined by such considerations as the sacredness of the site of older temples, and it is not only irrelevant but an utter anachronism to ascribe to the Greeks of the time of Pericles modern theories of vista and alignment. Even if it were not so, even if the Greeks did deliberately disregard such things as axis lines, do the consulting architects seriously maintain that in schemes of civil improvement we are to ignore our great architectural monuments?

These are only some of the points open to serious criticism in this report. Its authors appear to have assumed that if the bridge is laid out on the axis line of the dome of St. Paul's it inevitably follows that the subway for trams must skirt the south side of the Cathedral, and in your account of the proceedings of July 12 opposition to any such proposal occupies a prominent place.

But, as a matter of fact, able schemes have been prepared showing how it is possible to set the bridge on the axis line and yet keep the subway to the east of the Cathedral. I cannot find any consideration of these schemes in the report.

The report of the consulting architects will have been read with keen disappointment by those who had hoped for better things. Its bias is shown by the reference in the report to "schemes for opening up St. Paul's as 'side issues.'" Surely this, the architectural or monumental question, is to Londoners generally one of the most important questions of the case. It is on this that artists and public men joined hands, and that the House of Commons took the action that it did. It is a matter of regret that, with the exception perhaps of Mr. Colcutt, the consulting architects have not seen their way to placing themselves in line with the reiterated artistic opinion of the country. That opinion will be maintained not less strongly than before, in spite of the consulting architects' report.

July 12.

TRADITION.

THE ARCHITECTURAL ASSOCIATION: SECOND SUMMER VISIT.

THE intense heat was probably responsible for the small attendance at this interesting visit, which took place on Saturday, July 8, to Hill Hall, near Epping, by kind permission of Mr. C. E. Hunter. A pleasant drive of about three miles from Epping Station leads to the Hall, which occupies an ideal situation on the level summit of a plateau commanding wide views in every direction over the well-wooded surrounding country. Its position is, indeed, remarkable, most Elizabethan builders having apparently preferred sheltered sites, but it is possible that the house which preceded the present one may have been placed for defence. The approach is by a very wide avenue with broad grass margins, centrally with the main entrance, which is from a carriage court surrounded by a low wall with piers. The general outlines of the house's history are at once apparent from the north or entrance front. The present building was erected by Sir Thomas Smith, who, in 1548, married the widow of the former owner, Sir John Hampden, and bought the reversion of the property. This worthy had an astonishingly varied Court career, extending through the reigns of Henry VIII., Edward VI., Mary, and Elizabeth. It says something for his capacity that, though loyal to the interests of the Protector Somerset, and falling with him, in 1550 he is again found in Royal employ under Mary. In 1557 he retired for a while and began to rebuild Hill Hall, but under Elizabeth he became Ambassador to France,

where he remained four years. It is recorded that in 1568 he began to build the north and west sides of the house "stronger and more splendidly." In 1577 he died childless, and was buried in Theydon Mount Church, being succeeded by his nephew, from whom the present non-resident owner of the property is the direct descendant. Although the core of the house is Elizabethan, and a considerable amount of work of this period is still visible both externally and internally, the general effect is Georgian, and dates from the time of Sir Edward Smyth, the third baronet, who, in 1714, remodelled the house and completely rebuilt the east front.

The plan is quadrangular and is effectively laid out, but, while the external design of the building in its general lines is also good, its detail is poor and coarse in most cases. The entrance front is in the main Elizabethan work, and follows the local custom (during the Middle Ages) of having its excellent brick construction decorated by dressings in cement in imitation of stone. This method has been carried on in the later work, and it is possible that it is partly from the limitations of the method and partly from renewals that the mouldings and enrichments generally are so poor in quality. The texture of the old brickwork has been ruined by cleaning and pointing. The entrance is by a flat-pointed archway under a Georgian colonnaded projecting portico, above which is a group of three millioned windows, with two sturdy Elizabethan chimney-stacks on either side; yet the imposition of a Georgian cornice and pediment surmounted by a quaint cupola successfully binds the whole into a not unpleasing composition. The east and south fronts face spacious lawns. Immediately surrounding the house on these fronts is a wide expanse of York flagging laid level with the turf with admirable effect. The east front is entirely Georgian, with central pediment containing the arms of Sir Edward Smyth and his first wife, Ann Hedges; it is two stories in height, surmounted by a balustrade with urns, and having an Order of Doric columns on lofty pedestals, which, by reason of the wide-spreading base mouldings used, actually appear to fulfil their real purpose of buttresses. The south front, also two stories in height, is topped by a steep roof with fine chimneys and Elizabethan dormers. Here, again, however, the whole is welded together by the erection of square topped, three-storied, Georgian towers at the S.E. and S.W. angles, which, projecting on the southern side, enclose a delightful recessed terrace on the south front. The west front is relatively modern and in part unfinished. In the internal courtyard is some truly weird detail of superimposed Orders, distinctly not in accordance with rule.

Internally there is much good detail in panelling and joinery of the Georgian period.

There are three fine staircases of varying dates, the latest an exceptionally spacious one with bracketed string and delicately-contoured twisted balusters. The Hall is two stories in height, and extends through the full depth of the building from south front courtyard, the first-floor corridor being effectively carried through it by an open colonnade along the courtyard side. A panel high up at the west end has the arms of Queen Elizabeth. A very fine Georgian chimney-piece, which originally stood inside the Elizabethan chimney-piece of the Hall has now been removed to the first-floor corridor. The house is full of fine old furniture, including some splendid specimens of Venetian and French work, and also contains numerous masterly water-colours (including one of the balustrade and baytree on the south terrace) and several portraits by Mr. J. S. Sargent, which alone were worth the visit to see.

Before returning to town a short visit was paid to St. John's Church, Epping, a characteristic work of the late Mr. G. F. Bodley, R.A.

The church has a nave of five bays, and chance of two bays with a shallow sanctuary. The arcade is lofty and there is no clear-story or chancel arch, the barrel roof running without interruption from east to west. The west end has a pair of windows, while the chancel, screened and sumptuously fitted, has a large traceried window above the lofty coloured and gilded triptych. All the external details are on an extremely bold scale, and this is particularly true of the tower, which was completed as recently as 1908. It occupies an unusual and singularly effective position (in view of the site) at the south-east of the sanctuary, entirely detached from the main walls, though united to the church by a corridor and low clergy vestry, the base of the tower serving as a choir vestry. It is all extremely fine architecture, though very unlike any traditional Essex work. The angle of the tower bears the appropriate text, "A city set on a hill cannot be hid."

ARCHITECTURAL SOCIETIES.

The Royal Institute of the Architects of Ireland.

The following is "The Humble and Loyal Address of the Royal Institute of the Architects of Ireland to Their Most Excellent Majesties King George V. and Queen Mary."

"May it please Your Majesties. We, your dutiful subjects, the President and Council on behalf of the Royal Institute of the Architects of Ireland, beg leave humbly and respectfully to approach Your Majesties with the expression of our loyal welcome on the occasion of Your Majesties' visit to Ireland,

House at West Bay, Dorset.

Messrs. Crickmay & Sons, Architects.

and to tender our most devoted and dutiful homage.

We confidently believe that the profession to which we belong, and which is so intimately associated with the progress of science and art throughout the Empire, will, under Your Majesty's beneficent rule, flourish in a long era of unbroken peace.

We earnestly trust that Your Majesty and our gracious Queen may be granted a long and glorious reign, and that we, your subjects, may have the felicity of extending our dutiful welcome frequently in the years to come.

Signed, on behalf of the Council,
ALBERT E. MURRAY, R.H.A.
(President),
(A. OWEN, F.R.I.B.A.
(Hon. Secretary)."

HOUSE AT WEST BAY, DORSET.

THIS house is situated on the slope of the hills at West Bay, Dorset, overlooking the English Channel. It is built of Purbeck stone and covered with Lawrence's dark tiles.

The contractors are Messrs. Wakeham Bros., of Plymouth, and the architects Messrs. Crickmay & Sons, of Victoria-street, Westminster, S.W.

ENGINEERING SOCIETIES.

The Society of Engineers (Incorporated).

The third vacation visit of the present session took place on the 7th inst, when, by permission of the Associated Portland Cement Manufacturers (1900), Ltd., a number of members of the Society and their friends visited the Swanscombe Northfleet Cement Works. It was at Northfleet that the earliest cement works were erected by the younger Aspdin, whose father had invented the product in 1824, and subsequently other works were erected by firms whose names have since become world-famous. The majority of these firms were combined in one company in 1900. The district in which these works are situated is peculiarly adapted to be the centre of the cement industry on account of the presence of unlimited supplies of chalk and clay, an ample quantity of fuel, and ready access to all parts of the world through the Port of London. The visitors were shown the chalk quarries adjoining the works, and the clay brought from the Medway. The amalgamation of chalk and clay in definite proportion is effected by batteries of washmills, the resulting slurry passing through a screening mill in a finely-divided state. The slurry then passes into the large mixing and storage tanks, and is finally pumped into rotary kilns, in

which the contained water is evaporated, and the dry material thus obtained is heated up to a temperature of about 2,800° Fahr. The hot clinker then passes through rotary coolers, which extract the heat, and from thence is delivered to the grinding mills, in which the clinker is reduced to a very fine powder. During the final stage of the grinding process steam is injected into the mill, subjecting each particle of cement to a repeated process of superficial hydration, thus regulating the setting time, and turning out the cement in a condition for immediate use, thereby obviating the trouble of turning over the cement before use on the site of works. The visitors were shown the cooperages, where casks for packing cement for export are made by machinery, many of the machines being of a special character, and patented by the company. Tea was provided by the company for their guests at the conclusion of the visit, after which a vote of thanks to the company for their courtesy was proposed and heartily accorded.

GENERAL NEWS.

Professional Announcement.

Owing to the retirement of Mr. William Eade, the partnership hitherto subsisting between him and Mr. E. Thos. Johns, Architect and Surveyor to the Ipswich Education Committee, has been dissolved. Mr. Johns' practice will be continued as before: his new address is 8, Lower Brook-street, Ipswich, and his telephone number 669.

The Royal College of Science, Dublin.

The Royal College of Science, Merrion-square, Dublin, the foundation-stone of which was laid by King Edward, was opened by King George on Saturday, July 8. The

Sir Thos. Manly Deane, B.A., R.H.A.

buildings, illustrated in the *Builder*, 1906, September 29 and October 13, are the work of Sir Aston Webb, R.A., and Mr. T. Manly Deane, R.H.A., on whom a Knighthood was conferred at the recent ceremony.

Men of the Day.

In the issue of *Vanity Fair* for July 5 some particulars are given under this heading of the career of Mr. Frank Matcham, the architect of a number of recent theatre buildings. A coloured portrait supplement is given in the same issue, the title of which is "Architect Matcham."

Department of Architecture, University College.

An exhibition of drawings and designs made by the students in the Department of Architecture at University College will be held from Friday, July 21, to Saturday, July 28, inclusive. The exhibition will be opened on Friday, July 21, at 5 p.m. by Mr. Leonard Stokes, F.R.I.B.A., President of the Royal Institute of British Architects. Tickets for the opening ceremony can be obtained from the Secretary of University

C 2

House at West Bay, Dorset.

Messrs. Crickmay & Sons, Architects.

College. The exhibition will be open on weekdays from 10 a.m. to 5 p.m. on the days following the opening to July 29. Tickets of admission are not required except for the opening ceremony.

University College Chemical Laboratories.

At the recent prize distribution at University College, London, the Provost read a letter which had been sent to Prince Arthur of Connaught, as President of the Appeal Committee, on behalf of the proposed new chemical laboratories, by Mr. R. C. Forster, announcing a further gift of 30,000l.

Pumping Station for the London Hydraulic Power Company.

The latest of the Company's five pumping-stations for the supply of hydraulic power in London is situate in Grosvenor-road, Westminster, about 300 yds. westward of Vauxhall Bridge. It has a frontage to Grosvenor-road, and extends for a depth of 470 ft. therefrom, comprises reservoirs for water-settling, engine-house, boiler-house, hydraulic accumulator tower, coal store, filter-house, overhead tanks, wharf and coal handling plant, boiler-feeding water softening and measuring plant, influx, efflux, and hydraulic pipe subway, with a subway under Grosvenor-road connecting the pumping station with the river wharf, together with resident foreman's house, men's messroom, workshop, storeroom, foreman's office, and sundry appearances. The Chief Engineer to the Company is Mr. E. B. Ellington, M.Inst.C.E., Westminster.

Public Library, New York.

The New York Public Library in Fifth-avenue and Forty-second street was recently opened by President Taft. The building was designed by the late J. M. Carrère and his partner, Mr. Thomas Hastings, and has cost more than 2,000,000l. There is room on the shelves for four million volumes; the site, valued as worth some 4,000,000l., was given by the municipal authorities, who also defrayed the cost of the fabric, which was begun ten years ago.

Report of the Joint Committee on Reinforced Concrete.

The Joint Committee on Reinforced Concrete have now completed their second report, and it will shortly be on sale at the Royal Institute of British Architects. In an introductory note the Committee state that since the issue of the first report in 1907 the use and knowledge of reinforced concrete for architectural and engineering constructions have steadily increased. It therefore appeared desirable that it should be reconsidered in the light of further experience, and this second report is the result of the Committee's labours. The section on "Materials" has been modified in certain details. The section on "Methods of Calculation" has been recast in form, and the standard notation (proposed by the Concrete Institute) has been adopted. The sub-section on "Columns" has been revised, and the formulae proposed have been recast, so as to include the cases in which the lateral or helical binding is a material factor in the strength. The suggestions which have been made from time to time by institutions and individuals have been of much value and have been fully considered. Professor Unwin, F.R.S., Captain J. Gibson Fleming, R.E., and Messrs. Wm. Dunn and E. Flinder Petre contribute appendices. The size of page has been reduced for convenience of handling, and the work will be issued in stiff covers at the price of 1s.

Parish Church, Carshalton.

A pageant was held last week (on July 5-8) in aid of the Completion Fund of All Saints' Church. The church, with the exception of the chancel, south aisle, and tower, has been rebuilt during the past few years, at a cost of 13,000l., after designs by Sir A. W. Blomfield, which provided for the erection of a new chancel, vestries, organ-aisle, and nave, and the restoration of the old chancel for use as a chapel. The low embattled tower, constructed of rubble stone and flint, stood between the chancel and nave, and it is believed that the chancel was the original church, the nave having been added temp. Richard II., and extended temp. William III. In the church were set up a monument—with an effigy by Rysbrack—to Sir William Scaven, and an altar tomb, temp. Henry VII., to Sir Nicholas Gaynes-

ford, his wife, and children; the figure of Lady Gaynesford is remarkable for a very large headdress.

Proposed Building Over a Burial Ground.

At a sitting of the Consistory Court of St. Albans, held at Chelmsford on July 7, a petition was preferred by the Rector and Churchwardens of St. Mary's, Chelmsford, for a faculty consenting to the erection in the churchyard of columns to support an iron staircase for purposes of an emergency exit from the Shire Hall, which abuts on the burial ground of the church. Mr. A. B. Kempe, Chancellor of the Diocese, decided that he had no power to grant the faculty prayed for, inasmuch as the Dissused Burial Grounds Act prohibited the erection of any building over a dissused burial-ground saving for the extension of a church, chapel, or meeting-house.

Kingswood Estate, Surrey.

The Walton Heath Land Company, Ltd., have bought from Mr. C. Bonsor an estate of about 650 acres, near Walton Heath. They propose to convert the property into a residential estate, with houses to stand within their own grounds of from ½ acre to 1 acre in extent. The houses will be of a more expensive kind than those which are usually built on such properties, and some are ready for occupation.

All Saints' Church, Highbury.

At a sitting of the Consistory Court of London on July 5, Dr. Tristram, K.C., Chancellor of the Diocese, granted a faculty for the enlargement of this church by the addition of a north aisle and vestries, and an extension of the chancel, at an estimated cost of 2,500l. The new buildings will be erected, in part, in the churchyard, which is unconsecrated and has not been used for interments. The church was built in 1863-4, after the designs, we understand, of Sir A. W. Blomfield.

The Quantity Surveyors' Association (Incorporated).

Mr. C. W. Ball, M.S.A. (Southsea), has been elected President of this Association for the ensuing year, and Messrs. T. J. Carless and Henry Riley, Vice Presidents.

COMPETITION NEWS.

Manchester Art Gallery Competition.

As a reply to several letters published in the *Manchester Guardian* taking exception to the assessor's decision in the preliminary competition for the Art Gallery, a number of Manchester competitors have signed a joint letter stating that they consider that the Corporation has conducted the competition on excellent lines, and that there is nothing in the assessor's report that would lead them to think that the selection of the ten final competitors is anything but a fair one. We understand that it is strongly felt by many architects in Manchester that, although there are minor points in the assessor's report which may not commend themselves to them, the competition as a whole meets with their approval, and it is a very unfortunate occasion upon which to pile up minor grievances against the assessor, calculated to discourage the appointment of a professional adviser by public bodies in the future.

Clydebank Public Library.

We learn from the *Glasgow Herald* that at a recent meeting of the Clydebank Town Council it was reported that fifteen designs had been submitted for the new public library, and that Mr. James Miller, A.R.S.A., architect, who was appointed assessor, recommended that the designs of Messrs. Gardner, Miller, & White, Glasgow, should be accepted. "The Library Committee by a majority approved of these plans, subject to their being submitted to the inspection of a librarian. An amendment was moved that the plans of Messrs. Stewart & Paterson, Glasgow, be adopted. On a division the plans of Messrs. Gardner, Miller, & White were agreed to by six votes to five." An award which is subject to the opinion of the commissioners untrained in architecture seems rather inglorious.

Church Schools, etc., Doncaster.

In a competition recently held for a new Unitarian church, schools, lecture hall, and institute at Doncaster the scheme submitted

by Messrs. A. J. Dunn, F.R.I.B.A., and J. Bernard Mendham, of Birmingham, was adopted, and the architects have been instructed to proceed with the work.

International Exhibition at Tokio in 1917.

The "Bulletin Commercial" (Brussels) states, on the authority of the Belgian Consul General at Yokohama, that the Committee of the International Exhibition to be held at Tokio in 1917 have opened a competition for the general plan of the exhibition installations. One prize of 3,000 yen (about 306l.), two of 2,000 yen (about 204l.), and three of 1,000 yen (about 102l.) may be given. Foreigners may compete. Proposals will be received up to September 30 next at the office of the Grand Japanese Exhibition, Department of Agriculture and Commerce, Kobikicho, Kyohashi-Ku, Tokio.

Capital City at Canberra, N.S.W.

Particulars of this competition have been printed in the *Builder*, and, with premiums amounting to 3,000l., many architects will desire to consider the matter. We suggest, however, that intending competitors will be wise to defer putting their ideas into shape until full investigation has been made into the conditions. The Competition Committee of the Royal Institute of British Architects are pursuing inquiries, and until a report is made the scheme cannot be recommended. It will be noticed in the conditions, among other unsatisfactory clauses, that "the designs will be submitted to a Board consisting of an engineer, an architect, and a licensed surveyor," who are unnamed; then the Minister of State will adjudicate upon the designs, such adjudication to be final and without appeal. In the first place, it may be doubted if the professional advisers to be appointed will be of sufficient standing to give confidence to competitors that their designs will be adequately studied; and, in the second place, no architect of worth will submit to the condition that his ideas are to be judged finally by a layman who is primarily a politician.

BOOKS.

British and Foreign Building Stones. A Descriptive Catalogue of the Specimens in the Sedgwick Museum, Cambridge. By JOHN WATSON. (Published by the University Press, Cambridge.)

MR. JOHN WATSON'S treatise on this subject, which has been published by the Cambridge University Press, comprises, *inter alia*, a descriptive catalogue of the specimens of building stones of all countries, recently collected and arranged in the Sedgwick Museum at Cambridge.

Although primarily intended for the use of students of geology, the work contains a vast amount of valuable practical information relative to the colour, texture, weight, crushing strain, porosity, and other characteristics of building stones, which should cause it to be regarded as a welcome addition to all architectural libraries.

The descriptive notes, which precede the catalogue, include the names and dates of erection of many important buildings in which some of the various building stones collected in the Museum have been used.

Each specimen of stone placed in the Museum bears a label containing the following particulars, viz.:

- (1) The name by which the stone is best known to commerce.
- (2) The stratigraphical position of the stone, or, in the case of an igneous rock, its petrological designation.
- (3) The names and the locality of the quarry whence the specimen was obtained.
- (4) The name and address of the donor of the specimen.

As Mr. Watson points out in the Introduction to his work, "quarry owners, architects, and others" are not always in absolute agreement as to the designations by which a particular rock is recognised in the building-stone industry, nor "is the name adopted by them always in accordance with geological nomenclature." For example, in commerce, stones which have no affinity whatever with those rocks are frequently distinguished as granite, the "Petit Granit" of Belgium, which belongs to the carboniferous limestone, being a notable instance.

In addition to notes on the physical characteristics of a stone, its chemical composition is given in those cases in which it is known, and this notwithstanding the fact that chemical tests and analyses are often regarded as unreliable guides in determining the qualities of building stones.

But whilst recognising the fact that in many cases an analysis of its chemical composition is not, as a rule, so useful to the practical man as a knowledge of the physical properties of the stone with which he has to deal, yet Mr. Watson rightly lays stress upon its importance.

As an instance—"The atmosphere in and around large cities and centres of industry is usually charged with gases and impregnated with various acids. These acids, when caught by the falling rain are deposited in solution on the buildings, and often, by chemical action, cause a decay of the stone. It is, therefore, important to ascertain the chemical composition of a rock and thus arrive at its susceptibility to build under certain atmospheric influences."

The necessity of taking into account the two factors of weight and volume is lucidly pointed out. Thus, when stone is required for vaulting or other similar work, "the selection of one light in weight or of low density" is very desirable. On the other hand, in the construction of quay or dock walls materials of high density are requisite, because a stone when immersed in water loses a very considerable part of its effective weight. Furthermore, if "compared with its weight, the stone possesses a very large bulk, it presents a corresponding large surface to wave action, thus increasing the scope for field of disturbing force. The two factors of weight and volume must, therefore, be taken into consideration; they show that, the smaller the surface area of a stone and the greater its unit weight, the less likelihood there is of disturbance." In other words, the higher the specific gravity the greater the stability.

In the view of the author of the treatise under discussion, the test of compression or crushing strain is generally treated by architects and workers in stone with less consideration than it deserves, because whilst the resisting power of most building stones greatly exceeds the strain which they are usually required to support, yet the test is extremely useful as an aid in determining their weathering properties. For the durability of a rock is dependent either upon the manner of contact of the mineral particles of which it consists, or upon the strength of the particles themselves. And in the latter case its durability is determined by the strength of the weakest material, which is abundantly distributed throughout the mass. Thus if the interstitial matter between the grains of sandstone is weak or lacks cohesion, the stone will be disintegrated when subjected to abrasion or exposed to the influences of the weather, however strong the grains themselves may be. A rock may consist mainly of quartz grains, and yet be so soft as to crumble when compressed between the fingers, while another rock, having the same general composition in which the grains are firmly cemented together may be one of the most durable of stones.

Again, the test of porosity or ratio of absorption is one of extreme value and, as such, ought to be considered in addition to other physical features of building stones. Amongst resulting evils walls built of a stone possessing a high ratio of absorption are, of course, liable to be damp, and this is more especially the case if, in addition to being porous, the stone used is fine in texture, for water penetrates further, and is retained longer, in small cavities than in large ones.

On microscopic examination, such a stone will probably be found to contain minute fissures, through which water will be absorbed to a considerable depth by capillary attraction. Moreover, danger from frost depends not so much upon the amount of absorption as upon the size of the pores, and rocks with large pores stand frost better than those with small ones, because they do not retain the water which they absorb.

It is well known that, although a certain class of stone may have proved its durability in a particular building, yet it is not necessarily a guarantee that the same rock will give equally good results if employed for

structural work in another district, and Mr. Watson duly emphasises the fact in the following words, viz.:—"Geographical and meteorological variations have to be considered, for a sudden change of temperature is a powerful agent in the destruction of rocks, because, as a rule, stones possess low conductivity for heat and but slight elasticity. Rocks frequently reveal a tendency to decay when placed in a position which is much exposed to the sun, whereas the building remains perfect if it is shaded or has a northern aspect."

Two striking examples may be referred to—Somerset House, in London, built of Portland stone from the upper division of the Jurassic system in Dorsetshire, is much more decayed on the south side than on the north; and York Minster, built of magnesian limestone, is also more decayed on its southern than on its northern aspect."

A changeable climate may also affect the durability of stone, whilst the presence of corrosive substances in the air—or even of much moisture—will cause a rock to disintegrate more rapidly than it would in a purer or dryer atmosphere; and, although constructed with the same stone, buildings in the country, owing to a growth of lichens, which frequently covers the entire surface of the stonework, and thus affords some protection against the ordinary causes of decomposition, are often more durable than those in populous and smoky towns.

It is generally admitted that nearly all stratified rocks used for construction should be placed in the building with the bed of the stones as nearly horizontal as possible, and that the exposed surface should be formed by a cross-section of the natural divisional planes. Thus placed the stone is best able to resist atmospheric disintegration, inasmuch as it occupies in the artificial structure an approximately similar position to that which it originally occupied in nature.

This well-known principle is of such extreme importance as to render it incumbent upon those responsible for the carrying out of structural work in stone to be able to discriminate with absolute accuracy the plane of the bed of any building stone.

Although in many rocks the direction of the bed is easily distinguishable, in others, owing to their evenness of grain, it is extremely difficult to ascertain. Rocks known as "free-stone" are included in this latter category, and the chances of discrimination are minimised if, as is often the case, the stone is roughly trimmed down to a rectangular shape immediately after it has been quarried.

Most rocks, especially those of the limestone and sandstone species, undergo a process of hardening on exposure to the atmosphere after being quarried. This result has been explained on the supposition that the water with which the stones are permeated holds in solution or suspension a small amount of siliceous, calcareous, ferruginous, or clayey matter which, on exposure to the atmosphere, is drawn by capillary attraction to the surface of the block and evaporated. Thus the dissolved or suspended material is deposited, and serves as an additional cementing constituent to bind the grains more closely together."

Whether the theory be right or wrong, there is no doubt that the process of "seasoning," which, in this case, means hardening, is one that should invariably be insisted upon. It is on record that Sir Christopher Wren rejected any stone for use in the erection of St. Paul's Cathedral which had not been quarried and exposed to the atmosphere for three years.

We agree with Mr. Watson that colour forms an important factor, from an architectural point of view, in the selection of a building stone. The range of colours from which a selection can be made is an extensive one, and facilities for transport are now so great that a choice of colour can be secured for almost any neighbourhood. But, "although from a decorative point of view the beauty of stone depends on its effective appearance, to the architect and builder, as well as to the student of economic geology, there is a beauty in a good stone beyond that which appeals openly to the eye—a beauty more subtle, requiring a scientific as well as an artistic appreciation—the impression it gives of strength and suitability for its purpose."

Of the wealth of information contained in

the descriptive notes on British, colonial, and foreign building stones the space at our disposal does not admit of more than a few examples.

Under the section "Igneous Rocks (Plutonic)," the physical properties and chemical composition of British granite obtained from Cornwall, Devonshire, Westmorland, Cumberland, Leicestershire, Wales, the Isle of Man, Scotland, Ireland, Jersey, and Guernsey are concisely described, whilst under "Igneous Rocks (Volcanic)," notes are given upon the green slate stone obtained from the Borrowdale quarries in Cumberland, the Melrose Agglomerate, and Dolerites from Scotland, and the Tardree stone from Co. Antrim, Ireland.

Polyfant stone (Cornwall), Salcombe stone (Devonshire), and St. Catherine stone (Argyllshire), are dealt with under the section on "Metamorphic Rocks"; and that on "Sedimentary Rocks" comprises many of the geological formations known as the Cambrian and Silurian, Devonian and old Red Sandstone, Carboniferous, Permian, Trias, Jurassic, Cretaceous, Pleistocene, and Recent; and in the section on "Colonial and Foreign Building Stones" the same order is followed.

There is no doubt that Mr. Watson has produced an excellent manual upon a subject which, at least in its scientific and geological aspect is but little understood by the practising architect of our day, and we trust that his laborious efforts will meet with the prompt recognition and appreciation they deserve to receive from all who are interested in the study of building stones, which the author has presented in a form which appears to us to be at once scientific, practical, and interesting.

Tourist Guide to the Continent. Edited by PERCY LINDLEY. Illustrated and with maps. (London: 50, Fleet-street, E.C., and 124, Regent-street, W. Price 6d.)

This useful little work is the Great Eastern Railway Company's new illustrated *Tourist Guide to the Continent*. Amongst its features are particulars of new tours, *via* Holland, in North Germany, including the Harz Mountains and Thuringian Mountains; in South Germany, of the less-known side valleys of the Rhine; in Belgium, *via* Antwerp, of fresh tours in the Ardennes and old Flemish cities, and a series of continental maps. A chapter on "Tourists' Travel Talk," a vocabulary in English, French, and German, has been added.

Arc Lamps and Accessory Apparatus. By J. H. JOHNSON, A.M.I.E.E. (London: Constable and Co., Ltd. 1911. Pp. 132. 1s. 6d. net.)

THIS is another of Constable's electrical installation manuals, written for the benefit of contractors, wiremen, and engineers. As a guide to the choice of arc lamps for particular requirements the book should be generally welcomed, although it should be noted that several varieties of arc lamp are not mentioned. The notes of the author are of practical nature, and mathematics have been purposely excluded. We are sorry to see that the policy of exclusion has also been applied to the index, which ought always to be considered an essential adjunct to technical handbooks.

FIFTY YEARS AGO.

From the *Builder* of July 13, 1861.

The Foreign Office Designs.

IN the Commons, on the 8th inst., before the House went into committee of supply, a long and amusing discussion took place on the question (if it can still be called a question) of the style of the design for the new Foreign Office; involving, of course, a re-consideration of the respective merits of the Gothic and Italian styles of architecture.

Lord Elcho commented with some severity upon what he called the Palmerstonian style of architecture, and urged that Mr. Scott's design, or rather Lord Palmerston's, was altogether unsuited to the country, the climate, and the purpose to which it was to be devoted; and that a pure Gothic was that of which the country would approve. Mr. Scott had fallen into error in allowing himself to act as the mere draughtsman of the noble lord at the head of the Government.

EDITORIAL SUMMARY.

Our leading article, "An Interesting Experiment," deals with a report of the developments that have followed the opening of the first portion of the Protestant Episcopal Cathedral, New York.

Our second leading article (p. 32) is on "The American Academy in Rome," dealing with the scope of the newly-organised Academy.

Notes (p. 32) include: "As Others See Us"; "The Teaching of Art"; "London County Council Cottages Purchase Scheme"; "St. Paul's Bridge"; "Carnarvon Castle."

A Select Committee of the House of Commons has been considering this week the Bill for constructing a new bridge across the Thames at St. Paul's Cathedral. A report of the proceedings and the report of the three architects consulted by the Corporation in regard to the scheme will be found on p. 33.

Some notes of a visit of the Architectural Association to Hill Hall, near Epping, and to the Church of St. John, Epping, will be found on p. 36.

Book Notices (p. 38) include: "British and Foreign Building Stones."

Correspondence (p. 40) includes letters on: "Builders' Tools in the Middle Ages"; "Questions for Builders"; "National Insurance and Housing."

The Monthly Review of Construction (p. 43) contains: "Notes on Some Definitions used in Constructional Mechanics" (with diagrams); "North Surrey Schools, Anerley"; "Exhibition Buildings"; "Compressed System of Foundations"; and Notes.

The Building Trade Section (p. 47) includes: "Scaffolding; Telescopic Towers and Masts"; "The Medieval Builder's Labourer"; "Projected New Buildings in the Provinces"; "Applications under the 1894 Building Acts," etc.

A brief report of the opening proceedings of a Town Planning Conference at West Bromwich will be found on p. 51.

Law Reports (p. 51) include: "Dispute as to a Party Wall"; "Contractor's Action against Building Owner";

MEETINGS.

THURSDAY, JULY 13.
Northern Architectural Association. Annual excursion to Wymondley Hall and grounds. Meet at Stockton Station at 11.12 a.m. Visits to Stockton Parish Church and churches at Billingham and Norton.

WEDNESDAY, JULY 19.
Northern Architectural Association. Annual excursion.

FRIDAY, JULY 21.
Architectural Association. Annual exhibition of students' work. 3 p.m. to 6 p.m.

SATURDAY, JULY 22.
Institution of Municipal Engineers (Eastern District). Annual meeting at Goode's Hotel, Marine-parade, Yarmouth. 2 p.m. A paper, "Construction, Maintenance, and Repair of Highways," by Mr. W. Astley Norris, Surveyor to the Swaffham Urban District Council, will be presented for discussion.

CORRESPONDENCE.

National Insurance and Housing.

SIR, As so many of your readers are deeply interested in and have a practical knowledge of the housing problem, may I be permitted to ask for their consideration of an aspect of the National Insurance Bill, which, so far as I have seen, has not hitherto received much attention? I refer to its probable effect upon the provisions of houses for the class of persons on whose behalf the Bill is promoted—"employed persons" whose income is below 160*l.* a year.

Would some of your expert readers examine the following particulars to ascertain how far they correspond with experience? If they are approximately correct, it would seem that the employer's contributions, in so far as they concern the "housing of the working

classes," will ultimately be met by an increase in rents, without being of any benefit to anyone concerned, whether employer, workman, or property-owner. An exception should perhaps be made in the case of the owner of existing "slum" tenements, whose function of "sweating" property always finds its opportunity for exercise when there is a tendency towards increase in the rents of new decent dwellings.

I do not propose to refer to the 51st clause (really a property-owner's question), which, if not materially altered, must add enormously to the rents. But this will occur after the builder has ceased to have any direct interest in the property. The difficulty is obvious of framing any scheme to prevent the sick benefit from becoming in practice a grant in aid of rents; whilst, on the other hand, any curtailment of the power of the landlord to recover rent must increase the rent by the insurance value of such risk of loss. I am only concerned, however, at the present moment with the effect of the employer's contributions in increasing rent.

The matter suggests itself to me in the following way:—

If the employer is a builder, his contribution is 5*sd.* in respect of every payment of one week's wages (sometimes of part of a week). If the average wage of all his employees is 30*s.* a week, the addition to the cost of wages (with about 10 per cent. profit) would be 1½ per cent.

If the employer is a manufacturer of building materials and the average weekly wage which he pays is 22*s.*, the new impost (with manufacturers', merchants', and builders' profits) will result in about 1½ per cent. being added to the cost of the materials in the house.

Now, supposing, as in the London County Council block buildings, the building cost per room averages 120*l.* and the cost of labour and materials is two to one, then:—

1½ per cent. on 80 <i>l.</i> for labour is	£ s. d.
1½ per cent. on 40 <i>l.</i> for materials is	1 8 0
	0 12 0
Total	£2 0 0

To provide for this additional outlay would involve an addition to the rent of two, three, or more rooms of from 2*d.* to 3*d.* a week, if no increase is made to the single-room rents.

Supposing it is the case of the speculating builder, who is really the chief purveyor of housing accommodation in the suburbs. He builds a house to sell at, say, 230*l.*, with a ground-rent of 5*l.* 10*s.*, or lets it to a weekly tenant at 12*s.* The building cost may be apportioned as follows:—Profit, 20*l.*; cost of labour, 140*l.*; cost of materials, 70*l.* Whether there is another profit on the site value does not concern this question. But on the building cost the addition will be:—

1½ per cent. on 140 <i>l.</i> for labour is	£ s. d.
1½ per cent. on 70 <i>l.</i> for materials is	2 0 0
	1 1 0
Total	£3 10 0

To maintain the same ratio between building cost and rent will involve an addition to the latter of 2*d.* per week, which in practice would tend to become 3*d.*

It may be urged that all these extra costs will, as the result of competition, be paid out of profits. But competition has already exerted all the influence it can, with the result that the standard of the house provided by speculative builders has steadily risen. The only fresh element of competition is in the exemption of foreign-made materials from this new charge, thus penalising the British-made goods.

The ultimate effect of the employers' contribution would thus appear to be either a deterioration in the quality of the house or an increase of rents.

I have written with a view to London conditions; if some of your readers would consider the question under the conditions prevailing in other parts of the country it might prove useful. J. WALLIS CHAPMAN.

Builders' Tools in the Middle Ages.

SIR,—In the interesting article in your last issue, the wimple or wimble is said to be an early form of bradawl.

This is an error. It is still in use, and called by the same name by boat-builders and wood shipwrights in the west and Midlands.

It is an early form of brace, but with a fixed bit made entirely of wood.

No doubt the brace and movable bits is an improved wimble.

The latt axe is the plasterer's latt hammer—a short tool for use with one hand, a small axe at one end and a hammer at the other end of the head. Latt is still the north-country name for lath.

The hod had a short handle till quite the middle of the last century for ease of filling. The labourer put the handle of the shovel between his legs, and, holding his hod with one hand, filled the hod with the other hand. Gloucester. ROBERT PHILLIPS.

Questions for Builders.

SIR,—Builder's Manager's letter opens up a subject which needs very ample discussion. It is neither to the benefit of builder or public that hampering regulations or practices should be recognised, whatever their source.

Responsible officials and most architects of standing do not go out of their way to prejudice the interests of reputable builders. The question is, Where do these practices begin? The matter should be discussed freely, for it is desirable that the builders who have reputations to lose should not be sickened by the multiplying difficulties. It will be conferring a benefit if the *Builder* will open its columns for discussing the matter. JUSTITIA.

INTERCOMMUNICATION COLUMN.

Discharge from Pipes.

SIR,—Can you please tell the discharge per gallon per minute through a 6-in. diameter glazed pipe laid level its whole length of 260 ft., and having six bends in same? These may not matter, the head of water not more than 1 in. above top of pipe at inlet.

I really want to get a supply of 250 to 300 gallons per minute under circumstances named, and must I use 6-in. pipes, or what size? E. FORTRETON.

* The following are discharges calculated for pipes of different diameters with 1 in. head, allowing for loss of head by six bends:—

Diameter of Pipe.	Gallons per minute.
6 in.	37
8 in.	107
12 in.	230
14 in.	340

It would be advisable to raise the level of the supply pond if possible, so as to secure a greater head of water.

In any event, care must be taken in executing the work to see that the conditions stated are duly complied with.

ILLUSTRATIONS.

National Library of Wales, Aberystwyth.

THE foundation-stone of this building is to be laid by his Majesty King George V. to-morrow (Saturday) on a site consisting of 4 acres of land on a hill quite near the town. The position of the site, its height above the level of the new approach road from Penglais Hill, with the necessary steps and terracing as a base, called for a frontage line of buildings as strong as extended as possible.

The central block, containing the administrative offices, with the main entrance and great flight of steps to it, is therefore flanked on each side by the library hall and exhibition gallery blocks respectively. Beyond, on the north, the line is extended by the domed refreshment and heating building with its portico ending the upper terrace, and to the south by the librarian's residence and a small memorial hall, the length of the whole frontage extending to more than 500 ft.

The main block of buildings as designed will form four sides of a square, with a frontage of well over 250 ft., and a depth of the same dimension. The smaller blocks are grouped around and extend beyond these dimensions. The central part of the front block will consist of administrative offices and the main entrance

leading to a public hall in the centre of the quadrangle. From this central hall access will be obtained (1) to the great library hall on the north-western side; (2) to the exhibition block on the south-eastern side; and (3) to the Department of MSS., which will be built diagonally across the quadrangle.

The principal book storage is provided by means of "book-stacks," which will form the fourth side of the square block of buildings. The first stack will provide room for about 425,000 volumes; and two further stacks of nearly the same capacity can be erected beyond the first whenever required.

Opening out of the main hall and the exhibition hall, the architect, Mr. Sidney K. Green-slade, A.R.I.B.A., whose designs were selected in a competition limited to six nominated architects, has arranged for a series of buildings suitable for storing special collections of exceptional value, which it may be desired to keep together; and it is hoped that, as time goes on, possessors of very fine collections of books will give or bequeath them to the National Library, where they will become permanent memorials of their owners.

The great library hall will be in length 165 ft., the width 47 ft., and the height 38 ft. The books will be stored in alcoves around the room, with galleries above, the width of the hall between the alcoves being 27 ft. Tables for readers will be arranged in the centre of the hall and in the alcoves on each side. This part of the building will provide storage for 150,000 volumes.

The central portion of the building forming the main front will contain the administrative offices, and will include a Council chamber, rooms for the President and the Librarian and other members of the administrative staff. The principal entrance will be in the centre of this block, leading by a wide corridor to the central hall.

The octagonal central hall will be 42 ft. in diameter to the walls, and 25 ft. between the

Level for Use at the Ceremony of Laying the Foundation-Stone of the National Library of Wales, Aberystwyth.

Designed by Mr. Edward Spencer. Made by the Artificers' Guild.

columns. The corridors also extend from the central hall to the library hall, to the MSS. department, and to the print-room, with staircases on each side leading to the exhibition-room. On the first floor the gallery behind the columns, which may be used for special exhibition purposes, connects the whole of the upper floors of the building. The height of the central hall to the crown of the ceiling will be 50 ft., and 75 ft. externally from the ground level to the top of the cupola.

The central hall and its approaches have been so designed as to offer facilities for the display

of sculpture in the form of statues, busts, portraits, and other memorials of eminent Welshmen and Welshwomen, and great benefactors to the library. Special positions in the grounds and on the terraces surrounding the buildings have also been arranged for memorials of larger dimensions.

The MSS. department has been arranged to secure the maximum of security against perils of all kinds, together with abundance of light and quiet. The reading-room for this department is placed in the centre, with stacks for the storage of MSS. on each side

Royal Trowels and Mallet for Use at the Ceremony of Laying the Foundation-Stone of the National Library of Wales, Aberystwyth.

Designed by Mr. Edward Spencer. Made by the Artificers' Guild.

and in galleries above, and when complete these will allow of the storage of between fifty and sixty thousand MSS. A room for the keeper, and another for the exhibition of interesting MSS. requiring special protection, are arranged near the MSS. reading-room. The first contract includes one of the MSS. stacks.

The south-east block will consist of three floors. The lower floor will be used for the storage of a library of duplicates, available for circulation throughout the thirteen counties, and possibly to scholars and students residing beyond those limits. The main floor will contain the collection of prints, drawings, maps, and plans, and the general art library, with tables for readers. The upper floor will be an exhibition gallery, where interesting and rare books, fine buildings, prints and drawings, and other exhibits within the limits of the Charter, will be displayed. This block is of the same dimensions as the library hall.

The lower floor runs beneath all the buildings already described. This floor will be over nearly the whole of its area, above the ground level, which will enable it to be perfectly lighted, and it will be appropriated to the storage of bound newspapers, specifications of patents, Parliamentary papers, etc., with receiving, packing, and storage rooms for the whole building.

Throughout the building a standard height of 7 ft. 6 in. from gallery to gallery, including book-stacks, and of 15 ft. for the height of rooms, has been adopted, which produces a dead level of floors throughout and will enable a book-truck to be wheeled easily round the entire buildings.

The whole of the buildings will be of fireproof construction, and to secure the utmost safety the heating and lighting plant will be in a detached building, together with workshops, a book bindery, and a small printing office, for printing catalogue cards, etc. The caretaker's residence will also be a separate building.

It is necessary for the proper safeguarding of the building and its contents that a respon-

sible officer should always be in residence close by, and a house for the librarian will be erected on the south-east side, detached from the main building. The other building shown by the architect in the group of buildings is a suggested memorial or lecture hall. This, however, is not at present included in the scheme of buildings.

The total cost of the whole scheme of buildings, terraces, and roads, including a sum of 300,000*l.* for the provision of the book-stacks when required, is estimated to be from 150,000*l.* to 230,000*l.*, of which it is proposed to spend from 75,000*l.* to 100,000*l.* as quickly as possible in order to provide for the immediate and pressing needs of the library, and a first contract has already been let, and the work commenced for the erection of the library hall and a part of the MSS. department, involving, with certain supplementary work for roads, architects' and surveyors' fees, legal and other expenses, and the provision of the necessary fittings, bookcases, and furniture, which are not included in the contract for the buildings, an expenditure of about 45,000*l.*

Nearly two years have elapsed since the design for the National Library was selected by Professor Reginald Blomfield, A.R.A. Since then much time has been spent on the study and development of the scheme. Illustrations of Mr. Greenslade's original design appeared in our issue for June 19, 1909. Although nothing has been altered in regard to the principle of the plan, yet the scheme as adopted is a very much larger one than was dreamed of at first.

In the competition design the total length of the main frontage line was only about 200-0 ft.—it is now 265-0 ft., with a depth of 300-0 ft. to the back of the second stack, and the same proportional increase has been maintained everywhere. Fortunately, through the generosity of the Right Hon. Lord Rendel, the sill has been practically doubled in extent. The whole frontage from the domed block on the extreme left to the proposed Memorial Hall on the extreme right will be nearly 750-0 ft.

The whole of the central portion of the block with the quadrangle in the original plan was kept on the level of the ground floor only. Now it covers the whole of the upper floor also, thus giving much greater accommodation, and helping architecturally the dignity of the design.

The handle of the trowel used in laying the foundation-stone of the building is of carved ivory with mouldings of silver let into grooves in the surface, into which also Tudor roses of crimson translucent enamel, over fine gold are set between groups of gold rivets; it is mounted at the upper end with a silver crown of vine foliage and stems, with a band of silver moulding enriched with rubies and surmounted by an amethyst globe; it is connected with the silver stem by a band of silver set with rubies. On the blade, which has a thickened edge, there is a wreath of oak leaves and acorns each separately repoussed, and silver soldered to the stem. In the centre of the wreath is a circular panel with the legend engraved in Georgian script, and this is bordered by a composite twisting of gold and silver vines set with emeralds, cabochon cut. The shoulder of the blade has a chased border of rose leaves and flowers above a carved Welsh inscription.

Designed by Mr. Edward Spencer, of the Artificers' Guild, Conduit-street, the work was executed at the Chiswick workshops of the Guild in British-grove by Messrs. Frank Jobe, W. Glennie, A. Minns, craftsmen of the Guild. The woodwork is by Mr. Romney Green.

The Queen's trowel is of similar design, but the ivory handle has wreaths of may blossom and leaves in enamel and silver. Above the large wreath of alternate oak leaves and may blossom are two circular panels of hawthorn in silver and enamel surmounted by cabochon chalcedonies.

The level is of English walnut bound with silver mouldings and twists surmounted by a silver dome raised on four ivory columns with twisted gold wire let into their surface in vertical channels. From the dome hangs a plummet of green and white enamel which checks the action of a small spirit level enclosed with the silverwork of the base. Above the dome silver rose foliage set with amethysts and green agates encloses a panel with the Royal monograms surmounted by a silver crown.

The mallets have handles of ivory with red enamel, Tudor roses, and pique work surmounted by crowns to match that upon his Majesty the King's trowel, but the stones in the Queen's are sapphires, and emeralds. The head of the mallet is of English walnut half polished.

The cases are of grey Morocco leather with the Royal monogram in the centre surrounded by borderings of crowns and small monograms, lined with mouse-coloured velvet and ovster white silk.

Royal Academy Schools: Design for St. Paul's Bridge, etc.

THE conditions of the above subject were that a new road should be constructed continuing that at the east end of St. Paul's Cathedral, passing over Queen Victoria-street and Thames-street, and crossing the river by means of a new bridge at a given point east of St. Paul's Wharf.

The design deals only with the bridge and approaches.

It is suggested that the new road should widen at the approach to the bridge, forming a small "place" surrounded by office buildings in connexion with the adjacent wharves.

The northern approach is so designed that a good view of the dome of St. Paul's might be obtained from the bridge, with the pylons and their bronze groups, etc., forming a setting.

The ornament throughout has been made appropriate to the subject and its position, the cutwaters being suggestive of the prows of ancient galleys, and the bronze lamps over decorated with dolphins, etc.

The bridge is given only sufficient camber to obviate any appearance of sagging, the difference of level between the north and south shores being covered by the parapets.

MONTHLY REVIEW · of · CONSTRUCTION

NORTH SURREY DISTRICT SCHOOLS, ANERLEY.

THE new school recently opened at Anerley by the managers of the North Surrey District Schools presents some novel features of construction. For instance, its walls, both external and internal, are formed by concrete slabs 2½ in. thickness and about 1 ft. 9 in. by 1 ft. 5 in. size, dovetailed into each other, grouted with Portland cement, and supported by horizontal channels and steel uprights. Externally the walling is finished with Portland cement rendering, ¾ in. thick, and internally the surfaces of all walls and ceilings are covered with expanded metal thing and coated with marble plaster. The building work was executed with remarkable rapidity, the whole structure, including the boiler-house, drainage, and

North Surrey District Schools, Anerley.
Fig. 2. Detail of Construction.

North Surrey District Schools, Anerley.

the installation of the hot-water system of heating, being erected and completed ready for occupation within fifteen weeks. The method of construction was as follows, viz.: A concrete raft, 6 in. in thickness, was placed over the whole of the site covered by the building, and the positions of all walls set out by steel channels and angles. The vertical supports of the walling and the steel stanchions carrying the main roof trusses over the gymnasium, spaced 10 ft. apart, were then fixed, and roof plates bolted to the uprights to receive the roof timbers. The surface of the concrete raft being above the level of the surrounding ground,

North Surrey District Schools, Anerley.
Mr. Cecil A. Sharp, A.R.I.B.A., Architect.

neither footings nor dampproof courses were required, but the thickness of the concrete was increased to 2 ft. under the main stanchions and at the junction of all walls.

To all appearance the structure, which is perfectly rigid, and absolutely waterproof and soundproof, is an excellent example of the successful application of a novel method of construction to a school building of the usual type of design.

Exclusive of its assembly hall and gymnasium, the school contains seating accommodation in its eleven well-lighted classrooms for 450 boys, and the subsidiary rooms, such as the teachers' room, cloak-room, etc., are spacious and well arranged.

This school building was the subject of a competition, instituted by the managers of the North Surrey District Schools, in which the design submitted by Mr. Cecil A. Sharp, A.R.I.B.A., of 11, Old Queen-street, Westminster, was selected for execution, and the work has been carried out under his superintendence.

Fig. 1 of the accompanying constructional details shows the angle treatment of the concrete slabs, Fig. 2 the cavity windows, etc., and the concrete raft and floor.

NOTES ON SOME DEFINITIONS USED IN STRUCTURAL MECHANICS—(Continued).

By PERCY J. WALDRAM, F.S.I.

MODULUS OF ELASTICITY AND DEFLECTION.

THE practical designer wishing to understand the important subject of deflection is not in nearly all text-books with the statement that the subject is beyond his intelligence, and that he must trust blindly to the formulae and rules supplied to him. As these formulae usually involve the calculation of Moments of Inertia, he seldom uses these, and, therefore, probably fails to note the small mathematical differences in them which indicate that the *stiffness* of a beam or cantilever bears little or no relation to its *strength*. Failure to appreciate the importance of the essential factors regulating stiffness frequently leads, on the one hand, to undue confidence in the strength of a beam or member which proves to be stiff under its load, or, on the other hand, it may lead to unexpected and disfiguring deflections occurring in members whose strength may have been quite correctly predetermined.

If the factors governing deflection be investigated with a little care and a very little common sense, the subject will be found to be no more difficult than the mechanics of a child's seesaw.

It is well known that the strength of a girder or cantilever varies directly according to its fibre strength (f) multiplied by its muscular development or section modulus, Z (which is roughly its effective flange area \times its effective depth, or ad), whilst its length (l) directly decreases its strength, or

$$\text{Strength} \propto \frac{ad}{l} \times f,$$

and in the case of beams of rectangular section whose flange area (a) is always $\frac{bd}{4}$, and whose effective depth is always $\frac{3}{4}d$, then

$$\text{Strength} \propto \frac{bd}{4} \times \frac{3d}{4} \times \frac{f}{l} = \frac{b \cdot d^2}{6} \times \frac{f}{l}.$$

The deflection of a girder or cantilever being merely the result of the "give" of the flange fibres under stress, one would expect the stiffness to vary, like the strength, with the flange area, effective depth, and length. It certainly does vary with the flange area, i.e., with the flange stress, but the depth and length affect it very differently.

If the flange stress in a girder or cantilever be reduced by halving the load, the deflection will be accordingly reduced by one-half, as would be expected. But if the flange stress be reduced to one-half by halving the

span, the deflection (Δ) will be reduced to only $\frac{1}{8}$ of its previous amount instead of $\frac{1}{2}$, and generally the deflection varies, not with the span, but with the cube of the span, or $\Delta \propto l^3$.

Similarly, if the flange stress be reduced by doubling the flange area, the deflection is halved, but if the flange stress be reduced by doubling the depth, then the deflection will be reduced not to $\frac{1}{2}$ but to $\frac{1}{8}$, the deflection varying inversely with the square of the depth,

or $\Delta \propto \frac{l^3}{d^2}$; and in girders of rectangular section, where doubling the depth also doubles

the effective flange area ($\frac{bd}{4}$), then the deflection would be reduced to $\frac{1}{8}$, viz., as $\frac{l^3}{d^4}$.

Still more strange is the want of connexion between the stiffness of a beam and the fibre strength (f) of its material. One would expect, for instance, a beam of oak or teak to be much stiffer than a beam of deal, whereas the exact reverse is the case—a beam of oak or teak, which will carry a distinctly heavier load than a beam of deal of the same size and span will always deflect more under the same load. A cast-iron beam is far weaker than a steel or wrought-iron beam of the same size, but all three would be of practically the same stiffness when stressed within the elastic limit. Concrete also within its small limit of elasticity is far more flexible than steel. Obviously, therefore, the rigidity of a material is no criterion of its fibre strength and must be separately studied.

Modulus of Elasticity.

The rigidity of a material is defined by what is known as its modulus of elasticity (E), an imaginary stress per square inch which would stretch the material to double its length or compress to annihilation; as, for instance, an imaginary stress of 13,000 tons per square inch for mild steel. If, instead of this imaginary stress, steel be loaded with only 1 ton per square inch, then the stretch would be $\frac{1}{13,000}$ of the length of the bar operated on. The E of a material, therefore, represents not only an imaginary stress, it also represents that proportion of the length of a stressed bar which it will stretch or compress under a stress of 1 ton per square inch. All deformations *within the elastic limit* can be easily deduced from this, and what takes place outside the elastic limit is of no practical consequence.

If the length of any bar be divided by the modulus of elasticity of its material, the stretch under a stress of 1 ton per square inch is obtained; and the stretch under any greater stress, such as 5 or 10 tons per square inch, is the same result multiplied by 5 or 10, as the case may be.

If a steel bar 13 ft. long were subjected to a stress of 1 ton per square inch it would elongate or shorten, as the case may be, to the extent of $\frac{13' 0''}{13,000}$ or $\frac{1}{1000}$ of a foot.

If it were loaded to the extent of 10 tons per square inch, the deformation would be ten times that amount, or $\frac{1}{100}$ of a foot. On the other hand, if the bar were 25 ft. long, the extension or compression under a load of 1 ton per square inch would be $\frac{25' 0''}{13,000}$ or $\frac{1}{520}$ of a foot; and if the load imposed a stress of 10 tons per square inch the compression or stretching would be $\frac{1}{52}$ of a foot.

The greater the stress the greater the deformation under that stress, and also the longer the bar the greater will be the total deformation. If a piece of elastic 6 in. long stretches to the extent of 1 in. under a load of 1 lb., then a piece 12 in. long would stretch to the extent of 2 in., and a yard of the same elastic under the same load would stretch to 3 ft. 6 in.

The term modulus of elasticity is an unfortunate one. It is not a measure of the elasticity of a material, which is its power of recovering its original dimensions after the removal of any stress, nor is it a measure of its ductility—it is a measure of its *stiffness*.

If the moduli of different materials, as given in Molesworth or any good text-book be compared, it will be found that they vary in quite a different manner to their respective *strengths*.

Deal has a higher modulus than oak, teak, greenheart, or any hard wood. Concrete is much less than steel, whereas hard and mild steels and cast-iron, which are widely different in strength, differ but little in stiffness. It is for this reason that there is but little to choose between the strengths of similar long columns of the three materials, which would all fail by bending; steel being commonly selected for such a purpose merely because it is the more reliable material.

The curvature of a girder is caused almost entirely by the stretching of one flange and the compression of the other under horizontal flange stress, the deformation of the web affecting the general curvature to such a minute degree that it may be (and in practice is) disregarded.

The effect of such stretching and compression of the flanges can be most clearly seen in the case of a cantilever loaded with a single concentrated load, as in Fig. 1. Before the weight is applied, let it be assumed that the cantilever is divided up into a number of regular panels. Upon applying the weight, the upper part of each panel will be stretched, and the lower part will be compressed, so that each panel will assume a taper form resembling the voussoirs of an arch, as shown in Fig. 2.

The alteration in the length of a flange would be its length \div the modulus of elasticity \times the stress per square inch, i.e., its stretch under a stress of 1 ton per square inch, multiplied by the stress it is actually receiving.

Let a diagram of flange stress per square inch be made as in Fig. 3, in which AG represents the flange stress per square inch in each flange of the first panel. Then the upper bar of that panel will be extended and the lower bar compressed by an amount equal to the length (AC) of the panel \div the modulus of elasticity (E) \times stress intensity per square inch (AG); or the alteration in length (CC' in Fig. 2) = $\frac{AC \times AG}{E}$.

Of this $AG \times AC$ will be represented by the area of the figure $AGhC$. If this area be called Q' then $\frac{Q'}{E}$ will express either the

elongation (CC') of the upper bar (Fig. 2) or compression (cc') of the lower bar.

The altered form of the panel is shown in Fig. 2, and the inclination of the line Cc' , which was originally vertical, will be measured by the linear extension of the upper edge \div half the depth of the girder, or by extension of $AC \div$ compression of ac or depth of girder

Even if the rest of the girder were subject

no further stress, this tapering of the first voussoir would have the effect of setting up a gradient of deflection, which passes along the whole length of the cantilever. It will be seen that the longer the cantilever the greater will be the droop or deflection between the first panel and the end, due to that initial gradient or slope set up in the first panel. So that the depth of the girder is one of the two essential factors which determine this initial gradient. If the extension CC' and the compression cc' were exercised in a deeper girder or cantilever the initial gradient of the first panel or voussoir would be obviously less severe than if they were exercised in a shallow girder. This fact is very important and merits some attention. Fig. 3A shows

two cantilevers of the same span and carrying loads which result in the same flange stress. And, therefore, the same stretch of the flange fibres CC' . Yet if the deflection of the deeper cantilever were considered reasonable, then that of a shallow cantilever would appear to be excessive to a startling degree. A small deflection does not, therefore, necessarily indicate moderate flange stresses and safety, any more than a large deflection necessarily indicates danger. In a short, deep girder or cantilever which deflects $\frac{1}{2}$ in. under its load, the fibres are possibly being punished to a far greater degree than those in a longer and shallower one which deflects 2 in. Deflection per se is no criterion of safety or danger unless it be considered in its proper relation to length and depth. Cases have been known where bridges which showed quite a small and satisfactory deflection under a test live load of locomotives were really so distressed by that load that they soon afterwards quietly collapsed under the load of their own weight.

Although the deflection of a cantilever is the result of the stretching of one flange and the compressing of the other, its amount is also affected by the depth, which determines the initial gradient, and by the length, which determines the effect of that gradient and also the amount of stretch.

It will now be clear why the depth of a girder has a greater effect in reducing deflection than it has in reducing flange stress. In reducing flange stress in a rectangular girder it acts twice over, first by increasing the area of the flange, and secondly by increasing the leverage at which that area acts, viz., $d \times d$ or d^2 . In reducing the deflection it acts first in that double fashion, in determining the flange stress, and then exerts its influence again in determining the initial gradient, and so acts as $d^2 \times d$ or d^3 , instead of d . Or in the case of thin webbed girders, where it exerts no influence in the area of the flange, it acts as $d \times d$ or d^2 instead of d . The length also of a banded

cantilever or girder, which has previously used its influence as leverage in setting up flange stress, acts over again with regard to deflection by multiplying the initial gradient and operating, therefore, to increase the deflection as $l \times l$ or l^2 . It has, however, a further influence, because if we consider the remaining panels we find that each panel has its own particular flange stress which, in its turn, has to be multiplied by the length of each panel, and sets up a further gradient, which contributes a further quota to the total deflection. So that the length acts over again in the same way that a 6-in. stretch takes place in a yard of loaded elastic as compared to 2 in. in a foot similarly loaded. The length, therefore, operates to increase deflection, first as leverage by increasing the flange stress, then to enhance at the end the camber of every voussoir, and then also by collecting the different stretches of every voussoir or panel under stress. So that, whilst it only acts as l to enhance the flange stress, it acts as $l \times l \times l$ or l^3 to enhance the deflection.

The total deflection DD' in Fig. 4 is, of course, the sum of all the deflections, each one of which is equal to the area of the stress diagram of each panel $\div Ed$ and multiplied by its distance from B , and the total deflection DD' is equal to the area of the whole diagram \times the distance of its c.g. $\div Ed$. This gives the key to the whole problem of deflection of any parallel girder. All we have to do is to imagine the diagram of flange stress in either flange per square inch as a load, and its moment about the point of deflection (in this case B) will represent the deflection due to it—as there are two flanges, and both are deforming under the stress, this must, of course, be multiplied by 2.

If, therefore, G represents the entire area of the diagram, and X the distance of its c.g. from B , the deflection will be $= \frac{2GX}{Ed}$.

In the next instalment this simple solution will be applied to different classes of girders and cantilevers, with precisely the same results as are obtained by most obscure mathematical processes.

EXHIBITION BUILDINGS.—VI.: EXAMPLES AT THE FRANCO-BRITISH EXHIBITION.

TAKEN as a whole, the numerous buildings erected for the Franco-British Exhibition in 1908, and with one or two exceptions still to be found at Shepherd's Bush, cannot be regarded as ideal structures from the standpoint of fire-resistance. The reassuring fact that no outbreak of fire has occurred at any of the exhibitions held on the site may be taken as evidence of prudent administration and the safeguards adopted by the responsible authorities.

Some of the buildings include more or less fragmentary examples of fire-resisting construction, chiefly in the form of flooring and partitions. The reinforced concrete platform in the Stadium have already been mentioned in a preceding article, and among other fire-resisting floors we may cite those constructed by the Armoured Tubular Flooring Company in the Picture Galleries, the Soap Milling Hall, the Restaurant, and the tower in the Villa Village.

The pavilions and halls at present to be seen on the site represent either steel or timber framework faced with plaster, and therefore little or no better than the average exhibition building, although in some important respects superior to those which came to an untimely end in the Brussels conflagration.

A structure illustrating the principle of articulated, as distinguished from monolithic, reinforced concrete construction was the bakery erected at the Franco-British Exhibition by Messrs. D. G. Somerville & Co., and

at present forming part of the manufactory of Messrs. McVitie & Price, at Willeaden.

This building, originally occupying a site at the corner of the Grand Avenue of the Colonies and Empire Avenue, was dismantled at the conclusion of the Exhibition and transported in parts to its present situation. By adopting this type of building the firm were able to secure perfectly safe as well as convenient and substantial accommodation for their exhibit, and to avoid the loss of money consequent on the demolition of an ordinary exhibition building, and the sale of materials at merely nominal prices. The building, as erected at Shepherd's Bush, was founded on a reinforced concrete raft 6 in. thick, with concrete bases under and enclosing the lower part of the steel columns. This type of foundation was employed because the unstable nature of the ground would have involved serious risk of unequal settlement if ordinary footing had been adopted. It is true that the requisite degree of security might have been attained by pile foundations, or by carrying down piers to the underlying clay. But after due consideration it was decided that the reinforced concrete raft would be quite as satisfactory and at the same time far less costly than any alternative form of foundation works.

The surface of the foundation slab, finished with a layer of cement, formed a perfectly fire-resisting floor for the exhibition building, which consisted of a light steel frame with enclosing wall panels and interior partitions in reinforced concrete, the walls being only 3 in. thick.

The main tower was also cased in reinforced concrete, the outer surfaces of the building having been rendered in cement mortar and finished in rough-cast.

The roof principals were of steel, the framing having timber purlins and rafters covered with tiles. All the steelwork was completely protected, the general character of the building and its contents being such as to render very unlikely any serious outbreak of fire.

Messrs. Somerville & Co. deserve credit for the ingenious design of this building, which clearly merits notice as a first step in the direction of fire-resisting construction of exhibition buildings on a practical and economical basis.

THE COMPRESSOR SYSTEM OF FOUNDATIONS.

THE extensive use of concrete during recent years has caused engineers to turn their attention to rapid and inexpensive methods whereby it can be readily applied to a large variety of cases. Especially so is the various methods adopted for the formation of footings, whether it be applied in the reinforced form as a substitute for wooden piles or simply as concrete *en masse*.

On the Continent many innovations have been introduced, and one of them is the Compressol system of piling, or what might be considered as such, introduced several years ago by Mr. S. L. Dulac, a French engineer. The word "Compressol" is used to indicate the system, which is really a compressing of the soil by rams let fall a considerable distance, which on striking the ground cause a compression of the soil struck and leaves a hole for the insertion of the concrete as a foundation.

An arrangement similar to the ordinary pile-driver is used, excepting that the ram does not lose power by the friction of guides. These are absent, and the ram falls on release clear to the ground. The rams employed are of three types, and are shown in Figs. 1 to 3. The first, which is called the "borer," is of conical shape, having a pointed end containing a cavity. This cavity is to receive a sample of the earth penetrated, and when the borer is withdrawn can be inspected at each stroke.

The weight of this borer is about 32 cwt., being 6 ft. long and 2 ft. 4 in. at its upper diameter. The height through which the borer is allowed to fall varies with the soil and circumstances of the case, sometimes being over 30 ft. The rammer is lifted by means of a special automatic gripper which engages with the nipple-shaped head; a special ring attached to the driving-machine frame engages with the automatic grip and releases the ram. The borer is allowed to fall

Fig. 1.
Borer.Fig. 2.
Rammer.Fig. 3
Tester.

Compressal System of Foundations.

a sufficient number of times suitable to the case in point, and a hole is formed in which the sides have been sq compressed by virtue of the shape of the borer and the blow that they require no supporting.

A second ram is then used, called a "rammer," weighing a little less than the borer, being 3 ft. long and 2 ft. 2 in. largest diameter, of the shape shown in Fig. 2. The rammer is employed to drive several large stones which have been thrown into the pit after the use of the borer has been discontinued, and besides driving them to a firm bed, it forces them outwards and enlarges the base.

When these stones have been forced into position the hole is filled with concrete in layers about 18 in. thick, and a third ram, called a "tester," is employed to properly bed the concrete and spread it so that it properly fills in the pit. The tester is the heavier of the three, weighing about 1 ton, and, unlike the other two, which are dropped point downwards, it falls with the flat face undermost. The shape of the tester can be seen in Fig. 3, and its diameter is a little larger than that of the borer. A few blows from the tester only are required to complete the operation.

The result is a foundation somewhat of the shape shown in Fig. 4, the base, it will be seen, being larger than any other section.

From the information obtained of the set under the blow of the tester the value of the bearing power of the concrete pile is obtained. Suppose the weight of 1 ton falls 20 ft. and the pile is driven $\frac{1}{2}$ in. under the blow. The energy in the tester when it strikes the pile is 20x1 ton, or 20 ton-ft. As the pile is only driven $\frac{1}{2}$ in., then it would take twenty-four times the weight of the tester to drive it 1 ft., or the bearing power of the pile is 20x24=480 tons. Deductions must be made for vibration, etc., and a factor of safety allowed before the working load on the pile is obtained.

As a great number of buildings have been erected upon foundations made in this way, there is no reason to doubt its efficacy, and as there is a saving in excavation alone it might prove a considerable saving upon ordinary methods of forming foundations where it could conveniently be employed.

CONSTRUCTION NOTES.

Cork Paving Bricks.

A SANITARY, non-absorbent, and relatively noiseless material suitable for carriage drives, courtyards, and other places has recently been patented in the United States under the name of cork brick. It consists of finely-granulated cork mixed with asphalt and pressed into the form of

bricks, measuring 9 in. by 4 in. by 2 in. The bricks are laid flat on any level foundation. Where laid on concrete the foundation should first be covered with a thin layer of hot asphalt or a bed of sand. If the foundation consists of broken stone a layer of sand should be spread before placing the bricks, and where laid on wood the surface should be covered with hot asphalt. It is stated that the bricks absorb less than 14 per cent. of water by immersion, and that they afford an excellent foothold whether wet or dry.

REFERENCE to data given in most text-books shows that Size in Timber values for the ultimate strength of timber vary considerably among themselves, and are also much higher than the values ascertained by modern investigations. The chief reason for the abnormally high values so generally quoted is to be found in the fact that test pieces of small size were used, thereby reducing very largely the influence of defects which are inseparable from specimens of large size.

At the International Engineering Conference of 1904 Professor Lanza showed that, as compared with the ample records provided by small size timber tests, the data on large size specimens are very meagre. Among the latest tests of timber those conducted by Professor Talbot, at the University of Illinois, make very clear the danger of basing factors of safety upon values given by testing small size specimens.

His tests were conducted on timber beams measuring from 7 in. by 12 in. by 15 ft. to 8 in. by 16 in. by 15 ft., and, for the purpose of obtaining comparative data, on 3 in. by 3 in. by 40 in. beams cut from the larger specimens.

In Professor Talbot's tests the preponderance of failures in horizontal shear was very marked, and shows the importance of the shearing resistance of timber in large size specimens. The actual shearing strength developed in the beams averaged about two-thirds of the value given by blocks of the same wood measuring 6 in. by 8 in. by 12 in., and still less than values obtained by testing small pieces of selected timber.

To make clear the wide divergence between the results of large and small size tests we give the average values obtained by Professor Talbot on three varieties of American fir:—

Description of Timber.	Ultimate Bending Strength.			
	Cross-breaking Stress in Extreme Fibres.		Horizontal Shearing Stress.	
	Large Size.	Small Size.	Large Size.	Small Size.
	lb. per sq. in.	lb. per sq. in.	lb. per sq. in.	lb. per sq. in.
Longleaf pine.....	5,380	8,545	365	532
Shortleaf pine.....	4,865		364	
Douglas fir.....	4,111	8,322	302	515

Comparison of the large and small size results in this table demonstrates the influence of size in tests of timber, and shows how unreliable are factors of safety based upon test results of the latter category.

Portuguese Marble and Limestone.

THE British Consul at Lisbon reports that Portuguese marble is extensively exported to Brazil. "It is cheap and of excellent quality, and there seems to be no reason why it should not find a good market in the United Kingdom. Pure white marble deposits similar to and as good as Carrara exist in the North, but cannot be worked for want of railway communication. Red, grey, and mottled marbles and the yellowish white marble, which is used for lining houses in Portugal, are easy to obtain, as is also limestone—a compact, durable stone, readily cleaned."

Cement for Panama Canal.

IN A Consular report just received at the British Foreign Office it is stated that three years ago a cement company in Pennsylvania received a United States Government contract to furnish 4,500,000 barrels of cement for the Panama Canal. A clause in the contract provided that the Canal Commission

shall have the right either to increase or decrease the contract by 675,000 barrels. The company has now received notice from the Isthmian Commission that it will avail itself of the clause to increase the amount. It now appears that a very much larger quantity of cement will be needed than was originally expected, and considerable quantity more than the original 4,500,000 barrels will be ordered. The Commission has already increased its daily order from 6,000 to 6,500 barrels, which makes a train-load of from forty to fifty trucks.

Concrete Floor Surfaces.

TO OBVIATE undue wear of concrete floors and consequent surface should consist largely of hard stone aggregate in particles of not less than $\frac{1}{2}$ -in. gauge. The use of concrete with a liberal proportion of water is apt to bring small particles to the surface during the work of trowelling. If the finishing layer is applied before the main body of the concrete has hardened the thickness of $\frac{1}{2}$ in. is usually ample, but if applied after the building is practically complete the thickness should be at least 1 in. so that the new material may be capable of standing without relying upon bond with the old work beneath. By taking care to make the final coat of durable character, a concrete floor should be free from "dusting," but in case remedial measures should become necessary one or two coats of boiled oil or treatment with sodium silicate solution will be found effective.

Reinforced Concrete Boiler Settings.

UP to the present reinforced concrete has not come into general use for setting steam boilers, although a large number of boilers have been set in this material. It should be understood, however, that the flues and other parts exposed to flame and intense heat must be lined with fire-brick in the customary manner. The concrete should always be made with hard stone not liable to fly apart or to disintegrate under the influence of heat, and the proportions should be such as to insure concrete of close and dense quality. The design of the setting necessarily varies with the type of boiler to be installed, but presents no difficulty to those accustomed to deal with reinforced concrete construction. Judging by examples already built, it appears that the first

cost of a reinforced concrete boiler setting is practically the same as that of brickwork. But the ultimate saving should be an important item, as practically no maintenance charges are incurred for reinforced concrete, while, on the other hand, repairs of more or less costly nature are needed to keep brick boiler setting in good condition.

Crystalline Pigments in Paints for Wood.

THE beneficial effect of crystalline pigments, such as barium sulphate, quartz silica, and asbestos, has been demonstrated experimentally and in practice. The action of crystals in penetrating the surface and becoming attached by their corners to the fibre is of much value, and materially assists ordinary pigments in their duty. Some varieties of timber contain hardened pitch and sap, making penetration by paint very difficult, even when a volatile solvent, such as turpentine, is used. Some of the newer solvents, such as benzol, xylol, and other coal-tar products, have recently been tried experimentally with promising results. The penetrative power of these substances is high, and their price by no means prohibitive.

THE BUILDING TRADE.

SCAFFOLDING : TELESCOPIC TOWERS AND MASTS.

ALTHOUGH not intended to take the place of ordinary scaffolds in the erection of new buildings, telescopic towers and masts can be usefully and economically employed for various operations where the construction of pole scaffolding would be disproportionately costly. Practically all the leading firms of ladder

makers supply telescopic towers built of timber and constructed very much on the principle of extension ladders. A tower of this kind when closed forms a compact nest of sections which can be used by means of hand crank gear and steel cables, the top section being surmounted by a working platform, surrounded by guard rails, where one or two men can work in safety and comfort. Fig. 1 illustrates a six-section tower of the type made by Messrs. Heathman & Co., the base and winch being detachable, so as to facilitate transport and use in the interior of buildings.

Apart from their utility as independent units, these towers can be applied in pairs for supporting a working platform afford accommodation for several men, as represented in Fig. 2, an arrangement which is

Fig. 1. Heathman's Telescopic Scaffold Tower.

convenient for pointing and decorating the exterior surfaces of existing buildings. They are also advantageous for the support of the platforms required in connexion with the decoration of ceilings and walls in large public halls. Where so used several towers are placed at different points, and, having been extended to the required height, serve as supports for bearers on which a temporary floor is laid, the whole forming a substantial scaffold.

A more recent type of tower constructed of steel tubes is shown in Fig. 3. This machine, made by Palmer's Travelling Scaffolding and Scaffold Company, is not telescopic, but can be readily erected to any desired height up to 60 ft. The base is provided with double wheels at each corner, the top section carries a working platform square protected by guard rails, which can be applied whether the tower is built up to its full height or to any lower level. The tower can also be employed as a

centre support for staging required in the decoration of ceilings and domes in large buildings, the outer edges of the staging being carried by ladder scaffolds or any convenient alternative.

The most recent variety of telescopic apparatus for scaffolding purposes, and also available as a hoist for building materials, is the "Comet" mast, introduced into this country by Mr. T. Birnbaum, of 20, Bucklersbury. Fig. 4 is a view of the mast, showing it fitted with a working platform at the top. The mast is also supplied with a winch and tackle for hoisting materials.

The mast itself consists of a series of steel tubes, of successively decreased diameter and thickness, arranged to slide telescopically, as shown in Fig. 5. Each section has a ring clamp at the top and bottom, these clamps serving the two purposes of eliminating all shaking when the mast is extended, and of preventing all but the lowest tube to descend when the mast is being closed. A collar fixed near the foot of each section acts as a stop in conjunction with the top ring clamp of the next section, so that no section can be drawn out too far.

Fig. 6 shows the device described as a tube retainer. The pin *a* is automatically pushed outward one step at a time, so that only the innermost tube is hoisted, the sections being released one after the other only after the inner tube has been completely raised. The mast here shown is of circular cross section, but it should be noted that square masts are supplied for use as hoists with a winch capable of raising 3 tons.

Fig. 7 illustrates the mechanism for raising and lowering the mast. Within the pedestal is a drum driven by gearing and a chain and a sprocket wheel from one or two crank handle shafts. Around the drum is coiled a perforated steel band, the free end of which passes between two friction rollers, one provided with teeth to fit the perforations in the band, the rollers being actuated from the handle shaft simultaneously with the drum. As may be seen by Fig. 6, the width of the band is reduced

Fig. 2. Heathman's Telescopic Scaffold Tower.

progressively with the diameter of the tubes, and passes inside these as represented in Fig. 5. The band fits the interior of the tubes closely, and, being thereby prevented from buckling, is used to push up the several sections of the mast.

Fig. 3. Palmer's Tubular Steel Tower.

When it is desired to extend the mast the handles are turned, causing the band to unroll from the drum. The top section, attached at its foot to the end of the band, is the first to rise, the others following in succession as they are automatically released by offsets on the band. For the purpose of locking the sections after extension a device is included which automatically closes the ring clamps. Each length of tube is slotted by a longitudinal saw cut, and each clamp is closed and opened by a forked arm, projecting upward when the clamp is open and downward when the clamp is closed. The arrangement is shown in Fig. 8, its operation being as follows:—After any one section has been completely raised and the next section has begun to rise, the clamp

Fig. 4. The "Comet" Mast.

fork engages a pin carried on a bracket projecting from the bottom section of the mast, and the rising of the section causes the fork to be pulled down, thereby locking the ring clamp. In this way all the clamps are locked in succession. They are unlocked by a reversal of the process when the mast is being closed.

Apart from their utility as hoists and for the support of a small working platform, these masts can be used as poles for scaffolding inside buildings, while two or more of them can be used as standards for a gangway across their tops, thus enabling men to execute repairs or other work on exterior surfaces, the height of the working platform being adjusted from time to time as required.

The mast is made in numerous sizes up to 230 ft. high when extended, this size comprising thirteen sections and weighing about 10 cwt.

Fig. 5. Section of "Comet" Mast.

Fig. 6. "Comet" Mast Tube Retainer.

THE MEDIAEVAL BUILDER'S LABOURER.

THE mediaeval builder's labourer was, to-day, the man who was employed to do the rough work for the mason, bricklayer, tiler, and various others. With each skilled man a labourer was generally associated.

The common rate of wages paid to the labourer in the XVth century was 5d. or 6d. a day; in the XIVth century it was considerably less.

It will be noticed in reading the account of the cost of the repair of buildings in the Middle Ages that the builder's labourer was employed, or rather attached, to those crafts men whose business it was to work on, and with, heavy materials, such as stone, tiles, plaster, and so forth. The carpenter, glazier, etc., working upon the lighter materials, are not referred to as having an attendant labourer.

We will give several references from documents of the Middle Ages which will not only substantiate the above, but be of interest to themselves as references to mediaeval builders' labourers.

In Mr. Overall's Churchwarden's Account of the Church of St. Michael in the City of

Fig. 7. "Comet" Mast Hoisting Gear.

Fig. 8. "Comet" Mast Automatic Locking Device.

A XVth-Century Mason's Labourer, with wheelbarrow.

When we read of a mason being called in to do work in the church. The mason was paid 8d. for the day, and the payment to his labourer was 4d. Item paid to his laborer the same day 4d. This was in 1456, and in 1460 we read again, "to a laborer to serve the mason." In 1469 two masons working for two days and a half received 3s. 4d.; the two labourers at the same time received 2s. 1d. All this shows very clearly that each mason had his labourer to bring him materials and do the skilled part of the mason's work. Sometimes, however, labourers worked for themselves independently. In the same book accounts we read that two labourers were employed to carry a number of tiles from the church steeple, each receiving 5d. a day for a labourer. The same references to labourers occur in the Accounts of St. Mary-at-Hill, published by the Early English Text Society. Here we read of a labourer in 1429 being employed to lay a tile. The tiler was paid at the rate of 8d. a day, the labourer receiving 5d. In 1477 payment was made to "ii. tyllers and ii. laboreris, wirkyng upon John William's howse," and in the same year the churchwardens record a payment "to a wyber and his laborer, wirkyng in the tene-ment of John Brewster, tornour, in Estchepe" (lastcheap). It will be noticed that the labourers were paid by the day and half-day, not by the hour. Though there are so many references in medieval accounts to the builder's labourer, by almost all of them consist merely of the plain statement of the amount paid. In some instances the place of employment finds mention, but in no case is the name of the employer given. The names of skilled workmen, such as carpenters, joiners, masons, etc., are constantly found, but the name of the employer, so far as we are aware, is never recorded, probably on account of his humble station. Our illustration is a reproduction of a miniature in a MS. in the British Museum—MS. 18 E. V., f. 99. The picture is of value for two reasons—1. It shows us the exact relation of the division of labour between the mason and his labourer. 2. It exhibits very clearly the common dress of the mediaeval builder's labourer.

NEW CHURCH, PLYMOUTH.
The estimated cost of the erection of this church is 4,000*l.*, and the architect is Sir Charles Nicholson. The part now to be provided with is the chancel and the east nave.

A SAFETY CRANE HOOK.

The illustration reproduced in this page represents the Norden safety crane hook, a device designed to be self-closing, and consequently combining the handiness of a plain hook with the security of a shackle. The apparatus comprises the hook proper and the guard, these two parts being connected by a steel pin passing through eyes as shown. As the eye for attachment of the hoisting line or chain is formed in the upper end of the guard, the latter is automatically closed directly any load comes on the hook. The centre of the hinge pin is placed a little beyond the centre line of the hook, so as to cause the guard to press tightly against the

The Norden Self-closing Safety Crane Hook.

end of the hook and to make the projecting lug on the guard pass through the slot in the hook, where it can be secured by a cotter if thought necessary. The arrangement has the effect of distributing part of the load to the guard, thereby reducing strain on the hook proper. The device is made in vanadium steel in sizes for loads of 3, 10, and 18 tons respectively.

GENERAL BUILDING NEWS.

NEW CHURCH, MANSFIELD.
Mr. L. Ambler, F.R.I.B.A., is the architect for this church, which has been erected at Forest Town, and the cost of the building was about 3,800*l.* The contract was carried out by Messrs. Vallance & Son, builders, of Mansfield.

NEW CHURCH, HALIFAX.
This church, which is to be erected at Northwood, is designed by Mr. J. F. Walsh, architect. The seating accommodation will be

for 700 persons, and a detached tower is to be erected on the north east side of the church.

CHURCH EXTENSIONS, MAINDOE, NEWPORT.
The extensions to St John's Church are being carried out from plans prepared by Mr. Coates Carter, architect, of Cardiff. The estimated cost is 5,000*l.*, and the builder is Mr. W. A. Linton.

NEW SCHOOLS, CHELMSFORD.
These schools were opened last week, and have been erected from the designs of Mr. W. H. Pertwee, architect, of Chelmsford. The estimated cost of the buildings was 13,475*l.*, and the contractors were Messrs. H. Potter & Son, of Chelmsford.

BUILDING STRIKE, LLANDUDNO.
The labourers employed in the erection of the new higher standard school at Llandudno went out on strike on Monday of last week for an increase of a halfpenny in their wages. Their present wage is 5d. per hour, and they have been working ten hours a day.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with (the names of the applicants are given in parentheses).

Lines of Frontage and Projections.
Chelsea.—Iron and glass conservatory over the one-story portion in front of No. 31, Lowndes-square (Messrs. Robertson, Ltd., for Mr. J. A. Mullens).—Consent.
Clapham.—Erection of a church on the northern side of Calstock-road, Clapham Common, to abut also upon the eastern side of Alfriston-road (Messrs. J. S. Quilter & Son).—Consent.
Fulham.—Cinematograph building upon the site of Nos. 260 and 262, North End-road, Fulham, with a one-story portion in front (Mr. J. S. Beard).—Refused.
Norwood.—Erection of a building on the southern side of Wollington-road, Norwood, between Nos. 668, Knight's-hill, and No. 1, Wollington-road (Mr. A. R. Westworth for Mr. T. Marten).—Consent.
St. George-in-the-East.—Building on the southern side of Commercial-road East, St. George-in-the-East, between Upper Fenton-street and Anthony-street (Messrs. Billings, Wright, & Co. for the Feinman Yiddish People's Theatre Company).—Consent.
Strand.—Projecting illuminating sign at No. 54, Haymarket (Messrs. R. J. Back & Co. for Messrs. J. A. Sinclair & Co., Ltd.).—Consent.
Wandsworth. Bay windows, oriel windows, porches, and bargeboards in front of Nos. 100 to 124 (even numbers only), inclusive, Pretoria-road, Streatham (Mr. H. Thorpe).—Consent.
Wandsworth.—Oriel window in front of No. 27, Newstead-road, Streatham (Messrs. Pratt Brothers).—Consent.
Wandsworth.—Re-erection of the "Railway Bell" beerhouse, on the western side of Mitcham-road, Tooting (Messrs. Nowell, Parr, & Kates).—Consent.
Woolwich.—Erection of Nos. 30 to 44 (even numbers only), inclusive, Dunvegan-road, Woolwich (Mr. J. J. Bassett).—Consent.

Cubical Extent.
Battersea.—Erection of a building exceeding 250,000 cubic feet in extent at the premises of Messrs. Garton, Hill, & Co., York-place, Battersea (Messrs. Garton, Hill, & Co.).—Consent.

Cubical Extent and Space at Rear.
Brixton.—Re-erection of Nos. 476 to 484, Brixton-hill, and Nos. 1, 3, and 5, Tunstall-road, Brixton, with the trade portion exceeding 250,000 cubic feet in extent and with an irregular open space at the rear (Mr. J. W. Stevens for Messrs. Morley & Lancelay, Ltd.).—Consent.
Strand.—Erection of a building upon the site of Nos. 158 to 196 (even numbers only), inclusive, Regent-street, and Nos. 63 to 66, Kingsly street (Messrs. W. Woodward & Sons).—Consent.

Uniting of Buildings.
City of London.—Alterations and additions at premises abutting upon Newgate-street, Warwick-square, and Phoenix-court, City (Mr. C. Stanley Peach for the Oriental Carpet Manufacturers, Ltd.).—Consent.
Holborn.—Openings on the ground and first floors in the party wall between Nos. 113-122, Holborn, and Nos. 107-8, Hatton-garden (Mr. J. Sawyer for Messrs. A. W. Gamage, Ltd.).—Consent.

Peckham.—Double rolling shutters in lieu of double iron doors to an opening in a division wall at a motor garage, Red Bull-yard, Peckham High-street (Messrs. A. L. Gibson & Co. for Messrs. T. Tilling & Co., Ltd.).—Consent.

Woolwich. Double steel roller shutters in lieu of double iron doors to certain openings in division walls of a building at the premises of Messrs. Siemens Brothers & Co., Ltd., on the eastern side of Hardens Manorway, Woolwich (Messrs. Siemens Brothers & Co., Ltd.).—Consent.

Deviation from Certified Plan.

Kensington, North.—Re-erection of a portion of the "Golden Bells" hotel, Notting Hill-gate (Mr. W. Hancock).—Consent.

Alteration of Buildings.

Kensington, South.—Alterations in the basement of Nos. 13, Addison-road, Kensington (Messrs. Joseph & Smith for Mr. A. Levine).—Consent.

St. George-in-the-East.—Alterations to the "Bricklayers' Arms" public house, Fenton-street (late Upper Fenton-street), St. George-in-the-East (Messrs. A. R. Stenning & Partners for Mr. F. M. Fry).—Consent.

Buildings for the Supply of Electricity.

Hampstead.—Two wooden cooling-towers with steel substructures at the Hampstead Metropolitan Borough Council's electricity generating station, Lithos-road, Hampstead (Mr. G. H. Cottam for the Hampstead Metropolitan Borough Council).—Consent.

Uniting of Buildings.

City of London.—Formation of an opening between Nos. 1 and 2, Cheapside, at the ground floor level (Mr. C. R. Farrow for Farrow & Bank, Ltd.).—Consent.

City of London.—Formation of three openings between Nos. 16 and 17, Holborn-viaduct, at the second-floor level (Mr. W. E. Clifton for the Holborn Viaduct Land Company, Ltd.).—Consent.

City of London.—Uniting of Nos. 16 and 13, Moorfields, City (Boots Pure Drug Company, Ltd.).—Consent.

Hackney, Central.—Opening uniting buildings abutting upon Gleebe-road and at the rear of Nos. 432 and 434, Kingland-road (Messrs. Sinclair & Son for Mr. W. E. Garstin).—Consent.

Islington, West.—Opening of a larger size than specified in the said section in a division wall at Messrs. Callow's van works, Pembroke-street and Bameston-street, Islington (Messrs. Lovegrove & Papworth).—Consent.

Kensington, North.—Uniting of Nos. 11 and 12, Bolton-mews, Kensington, at the ground-floor level (Mr. L. Cutting).—Consent.

Limehouse.—Opening in the party wall between Nos. 125 and 127, Salmon's-lane, Limehouse (Messrs. H. Bignold & Idle for Mr. H. J. Knowlden).—Consent.

Marylebone, West.—Openings in the party wall between Nos. 3 and 4, Barrett-street and No. 5, Barrett-street, St. Marylebone (Mr. G. Longford for Mr. C. Fedral).—Consent.

St. George, Hanover-square.—Formation of an opening at the first-floor level in the party wall between Nos. 24 and 25, Conduit-street, St. George, Hanover-square (Mr. A. B. Jackson for Mr. G. Bowdon).—Consent.

St. Pancras, South.—Enlargement of an opening uniting No. 42, Tottenham-street, with a factory at the rear next to Tottenham-mews, St. Pancras (Mr. J. C. Mather for Messrs. Parkins & Co.).—Consent.

Cubical Extent and Uniting of Buildings.

St. Pancras, East.—Formation of a doorway in one of the division walls between blocks A and C and the use of double-armoured doors to such opening (Messrs. Burton & Co. Beito-dano for the F.I.A.T. Motor Cab Company, Ltd.).—Consent.

Strand.—Erection of a building on the site of Nos. 188 to 186, inclusive, Regent-street, and Nos. 55 to 53, King-street (Messrs. W. Woodward & Sons for Messrs. Swears & Wells).—Refused.

The recommendations marked † are contrary to the views of the metropolitan borough councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERARGOYD.—Fire-station (5051); Messrs. G. Beames & Co., builders, 16, Violet-road, Roath, Cardiff.

Banbury.—Extensions to Berrymoor Laundry; Mr. G. Earley, architect, Bridge-street, Banbury.

Bargoed.—School (5,000l.); Mr. D. P. Jones, architect, Charles-street, Cardiff.

* See also our list of Competitions, Contracts, etc., on another page.

Barleston and Hugglescote (Leicester).—School; Mr. C. Fowler, architect, 33, Bowling Green-street, Leicester.

Barnet Green (Birmingham).—Police-station; Mr. A. Rowe, architect, Foregate-street, Worcester.

Birmingham.—Factory, Brook-street; Messrs. E. Harper & Bro., architects, Ruskin-chambers, Birmingham; Mr. C. Bryant, builder, Small Heath, Birmingham. Christ Church schools; Mr. M. E. Type, architect, Edmund street, Birmingham; Messrs. Whitehouse & Son, builders, Waterworks road, Edgbaston, Birmingham. Theatre, High-street, King's Heath; Mr. V. Peel, architect, Temple-street, Birmingham. Jewellers' school; Messrs. Cossins, Peacock, & Jewellers, architects, 83, Colmore-row, Birmingham; Messrs. J. Dallow & Sons, builders, Blackheath, Birmingham. Factory, Garrison-street; Messrs. Richard Fenwick, Ltd., builders, 40, William Edward-street, Birmingham.

Biopham.—Additions to hydro for the Cleveley's Hydro Company.

Bolton.—Tramway repair depot; Messrs. Townson & Sons, builders, Park Hill street, Bolton.

Bolton-on-Dearne.—School (2,500l.); Mr. J. Stuart, architect, County Hall, Wakefield.

Boston.—School; Mr. J. H. Nichols, Secretary, Education Committee, Essex County Council, Chelmsford.

Bristol.—Rebuilding premises, Castle-street, for Mr. S. H. Justin.

Brixton.—School; Mr. W. V. Bushell, Secretary, Education Committee, Norfolk County Council, Norwich.

Broomfield.—School (4,470l.); Mr. J. T. Bailey, builder, Chelmsford.

Brynbo.—School; Mr. W. D. Wiles, architect, High-street, Wrexham.

Burton-on-Trent.—Governor's house for gas depot (2,250l.); Mr. Geo. Hodges, builder, Horninglow-street, Burton-on-Trent.

Chatham.—School (3,220l.); Messrs. Godden & Sons, builders.

Colleston.—Enlargement and improvement of school for the Slains School Board.

Dairycotes (Hull).—School, Hessel-road; Dr. J. T. Riley, Secretary, Education Committee, Hull Town Council.

Dalkeith.—Bank premises; Messrs. S. Mitchell & Wilson, architects, Edinburgh.

Derby.—Bank, Midland road; Mr. R. C. Thirby, architect, Irongate, Derby.

Dover.—School; Barton-street; Mr. R. Hawke, architect, Maison Dieu House, Dover.

Dundee. House, Sandman-street; Mr. Jas. Sibbald, architect, 25, Commercial-street, Dundee. Offices, warehouses, etc., South-road, Loches, for Messrs. East Bros., Ltd.

Dunfermline.—Council offices, Mavgate (6,000l.); Surveyor, Dunfermline Parish Council.

Edinburgh.—Established Church; Pastor, St. David's Established Church, Edinburgh.

Exeter.—Alterations at Cattle Market (1,530l.); Mr. E. H. Westcott, builder, Heavitree, Exeter.

Folkestone.—Additions, public baths, Food-road; Mr. A. E. Nichols, Borough Surveyor, Folkestone Town Council.

Friesland (W.R. Yorks).—School; Mr. W. V. Dixon, Secretary, Education Committee, W.R. of Yorks County Council, Wakefield.

Gale.—Shop and eight houses for the Littleborough Co-operative Society.

Gateshead.—Improvements at St. Mary's Church (800l.); the Vicar.

Glasgow.—Church offices, etc., corner of Battlefield and Cathcart roads, for the Deacons' Court of the Battlefield United Free Church.

Halfway.—School (300 places); Mr. J. W. Nicholas, Secretary, Education Committee, Carmarthenshire County Council, Carmarthen.

Halifax.—Six tramway shelters; Mr. W. M. Rogerson, Electrical Engineer, Halifax Town Council.

Heath Hayes.—Club, Hedges-road, for the Heath Hayes Liberal Association.

Hove.—Proposed school, corner of Dyke road and Old Shoreham-road; Mr. A. F. Graves, Clerk to the Governors, 117, North-street, Brighton. The following plans have been passed:—Mr. T. Barnard, ten houses, Langdale road; Mr. F. Parsons, eight houses, Vallance-road; Mr. S. James, for Mr. C. Handford, garage, Pembroke-crescent. A plan has been lodged by Messrs. Clayton & Black, for Mr. E. A. Smithers, for alterations and additions, "The Gables," Furze Hill.

Howden.—Additions and improvements at laundry; Mr. H. Green, Clerk, Board of Guardians, Howden.

Hyndland (Glasgow).—Tenement of houses, corner of Hyndland and York drives, for the Western Shops Company.

Lakenham.—School; Mr. C. Brown, architect, Cathedral House, Norwich.

Londonderry.—Restoration of St. Columba's Church; Messrs. Bachelor & Hicks, architects, Merriam-square, Dublin.

Maesteg (Glam.).—Extensions, Town Hall and market place (3,000l.); Mr. S. J. Harper, Surveyor, Maesteg Urban District Council.

Mapperley.—School; Mr. L. Maggs, architect, Shire Hall, Nottingham.

Matlock.—Post-office; Mr. H. Hopkinson, architect, Vankosp.

Mellor.—Conservative club and hall; local Conservatives.

Millom (S.O., Cumb.).—Alterations to school (1,500l.); Mr. R. G. A. Bradley, builder, Salhouse-road, Millom.

Milton.—School (5,700l.); Mr. W. Hutchings, architect, County Hall, Stafford; Mr. J. Moss, builder, Milton.

Newcastle-on-Tyne.—Additions, cottage homes (4,030l.); Messrs. E. Henderson & Sons, builders, Ponteland, Northumberland.

North Staffs.—Additions, North Staffs Infirmary; Messrs. Scrivenor & Sons, architects, Shelton, Hagley; Mr. S. Wilford, builder, Newcastle, Staffs.

Nottingham.—Extensions, Children's Home, Edward-lane; Mr. W. B. Starr, architect, Victoria-street, Nottingham; Messrs. Gilbert & Hall, builders, Crocus-street, Nottingham.

Oldham.—Additions, North Staffs Infirmary; Messrs. Scrivenor & Sons, architects, Shelton, Hagley; Mr. S. Wilford, builder, Newcastle, Staffs.

Parkstone.—Extensions, St. Osmond Church (6,000l.); the Vicar.

Parrell.—Alterations to premises for Messrs. Parrell.

Plymouth.—The following plans have been passed:—Messrs. Vickery & Sons, alterations and additions, premises, corner of Bedford and Cornwall streets; Messrs. Andrew & Co., Ltd., motor garage, etc., Bourn's place; Architects, care of Building Committee, church, Alvington-street.

Rotherham.—School, Kimberworth (15,660l.); Messrs. W. Nicholson & Son, Ltd., builders, Prospect Saw Mills, Sheaf-street, Leeds.

Salford.—The following plans have been passed:—Mr. H. James, sixteen houses, Selwyn-street; Messrs. Baines & Co., Ltd., extensions and additions to Phoenix Brass Works, Greasbro' road; the Trustees, United Methodist Church, chapel (455 l.), also schoolroom (270 places), Gerard-road and Tooker-road; Mr. H. Addis, four houses, St. Stephen's-road; Messrs. J. J. Habershon & Sons, additions to works.

Salford.—Extensions to offices, Eccles New-road; Mr. F. Townson, Clerk, Board of Guardians, Salford.

Saunthorpe.—Church, junction of Frodingham-road and High-street (3,030l.); Messrs. Pattinson & Son, builders, Ruskington.

Shephard.—Offices for the Shephard Hosiery Company.

Silsden.—Cooking centre; Mr. J. Stuart, architect, County Hall, Wakefield.

Smallthorpe.—School (5,700l.); Messrs. J. M. & Son, builders, Milton.

Smethwick.—Extensions, factory, Foundry-lane, for Messrs. G. Wrigley & Co., Ltd.

Stoke-on-Trent.—The following plans have been passed:—Messrs. J. Greenwood & Sons, Ltd., mill, Trafford Park; Mr. Paul Powell, picture place, Chalon-road.

Swansea.—Proposed civic centre; Mr. Geo. Bell, Surveyor, Swansea Town Council.

Torquay.—The following plans have been passed:—Sister Superior, additions, St. Vincent's Orphanage; Mr. J. H. Midgley, additions, "Birstwith"; Mr. E. G. Easterbrook, additions, Geneva Bakery; Mr. Kellow, four houses, Hapway-road.

Tunstall.—School, Goldenhill; Messrs. A. R. Wood & Son, architects, Burslem; Mr. F. Pemberton, builder, Tunstall.

Wigan.—Coronation hall, Wytarn Estate (5,000l.); Messrs. Settle & Brundrit, architects, Uxton.

Walsall.—The following plans have been passed:—Mr. W. Oakley, shop premises, Wolverhampton-road; Mr. S. Moseley, four houses, Redcross-street, Leamore. A plan has been lodged by Mr. E. Smith for alterations and additions, premises, Stafford-street.

Wazep.—School, Burn's lane; Mr. C. J. Bristowe, Secretary, Education Committee, Notts County Council, Nottingham.

Waterloo.—School (1,200 places); Mr. H. T. Rutherford, Secretary, Education Committee, Blyth Urban District Council.

Wigan.—The following plans have been passed:—Mr. Peter Fairbairn, three houses, Smotherst-road; the Trustees, Primitive Methodist Church and School, Enfield and Wesley streets.

Yatalva.—Fifty houses; Surveyor, Pontardawe Urban District Council.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held in the County Hall, 60, Abchurch-lane, S.W., on Tuesday, the Chairman, Mr. Edward White, presiding.

LOANS.—The Finance Committee recommended, and it was agreed, that a loan of £1,000 should be made to the Greenwich Borough Council for the purpose of extending into the frontage of the Norman art depot and part of the cost of the end wall.

INTERNATIONAL CONGRESS OF ARCHITECTS.—At the request of the Royal Institute of British Architects, the Architect of the Council, Mr. W. E. Riley, is to represent the Council at the International Congress of Architects to be held at Rome in October next.

LAMBETH BRIDGE.—It was recommended by the Improvements Committee that application be made to Parliament for authority to construct this bridge as a steel arch bridge, 48 ft. wide, at an estimated cost of £1,000. This was agreed to.

ST. PAUL'S BRIDGE.—It was stated by the General Purposes Committee that the City Corporation had requested permission for the Chief Engineer of the Council to give evidence before the Committee of the House of Commons which was dealing with the scheme, and that permission had been given.

Mr. J. D. Gilbert, in considering this question, said that it was a matter of great regret and surprise that the London County Council had not been asked to express an opinion on the matter of this new bridge. He also considered that the Parliamentary Committee should have requested that the architect to the Council be called to give evidence "on behalf of the Council," and in a private capacity.

Mr. Gilbert went on to say that there was a reason why the Council, the greatest municipal body in this country, should not be represented on the Committee, and that money for the scheme did not belong to the Bridge House Estates Committee, but to London. He said that there had been much controversy in the public Press as to whether there should be a bridge leading from St. Paul's or whether it should be somewhere else, but he thought the Council should have the opportunity of giving their views on the matter.

Mr. Taylor, in replying, said that there had already been three eminent architects chosen to give evidence before the Committee, and that these gentlemen would no doubt find that the scheme proposed, should be one that would be all that was desired.

FIRE-STATION.—It is proposed to carry out certain necessary repairs and alterations which are required at the Whitefriars fire station at an estimated cost of £54. The Fire Brigade Committee reported that painting work is to be carried out at various fire stations, and that tenders had been received for that purpose. Tenders are also to be invited for electric lighting at the Kennington fire station.

PUMPING PLANT AT COLNEY HATCH.—It is reported by the Asylums Committee that it considered advisable to install a sewage pump at Colney Hatch Asylum, which will have a capacity of 300 gallons an hour and be driven by a gas-engine, instead of the steam pump now in use.

LONG GROVE ASYLUM.—It is also proposed to widen the verandahs attached to the mission hospital villas, for the purpose of the accommodation of patients in bed, and the Asylums Committee stated that the estimated cost of the alteration was 1937. It was also reported by the same Committee that a house is to be erected at this asylum for the first assistant medical officer.

TOWN PLANNING CONFERENCE, WEST BROMWICH.

A CONFERENCE of municipal authorities on the subject of town planning, convened by the Institution of Municipal and County Engineers, was opened recently in the lecture theatre of the Institute, West Bromwich. Mr. A. D. Greatorex, M.Inst.C.E.,

President of the Institution, presided, and there were present representatives of municipalities and municipal engineers from all parts of the United Kingdom.

The President in his inaugural address said:—

"The town planning part of the new Act involves a mutual advance in the relations between the owners of land and the local authorities in this country, and enables each party to co-operate with the other in promoting the general interest."

Many complaints have been made as to the complicated nature of the regulations issued by the Local Government Board, but you have, no doubt, seen sufficient of the working of the Act to recognise its immense value in dealing with this problem.

The necessary amendments to the Housing and Town Planning Act can only be brought about by a careful study of what is a complex Act in all its manifold and intricate bearings. The aims of the Act are undoubtedly high, and have for their object the permanent improvement of the public health. The future alone will prove whether this portion of the Act is in many cases as unworkable as some of its critics say it is. The initial stages of several schemes are already being proceeded with by local authorities, and no town has shown more interest and practical consideration of this subject than the neighbouring city of Birmingham.

For the improvement of our towns the first thing to be demanded is the provision of worthy routes connecting the centre with the open country. The development of the tramways is resulting in a continually increasing proportion of the population being brought to their daily work, and if the routes are finely planned and studied with a view to their artistic effect they will in themselves exercise an educational influence on all who use them.

Expressions of opinion have been given to the idea that municipal engineers and surveyors are not the proper persons to be entrusted with the carrying out of this Act, but that members of other professional bodies are more competent to undertake this work. Who, after all, is better able and qualified than the local surveyor, by reason of his knowledge of not only the internal working of the Act, but by his general knowledge as to what is necessary as regards the development of the district and the lines which it should take? But we must show ourselves able to fulfil these duties.

It therefore behoves every member of this Institution, especially those who are likely to have to deal with this subject, to make themselves thoroughly acquainted with not only the various clauses of the Act, the regulations framed and issued by the Local Government Board, but with all the developments which take place from time to time in connexion with the subject.

The desire of the Council in arranging this Conference was of a twofold character—firstly, to ventilate the subject amongst the members of the Institution, and thus to give them the opportunity of becoming fully acquainted with the method of its working and latest development, and, secondly, to show to the general public, and especially the members of the various local authorities, that the engineer and surveyor was fully alive to his added responsibilities and well able to perform the extra duties placed upon him by the Act when called upon, and, at the same time, to show that on account of the peculiar position in which he was placed no one was better able to deal with this subject.

Conferences alone will not solve the problem, but they undoubtedly have a very definite value in this connexion, because the majority of the delegates go prepared either to add their quota of knowledge to others or to learn something which may throw light upon some of their own local difficulties."

Mr. W. T. Lancashire, M.Inst.C.E., City Engineer of Leeds, presented the first paper, on "Town Planning in Congested Areas and Improvements and Street Widening in the City of Leeds." He said that, like many other of the great commercial and industrial cities, Leeds no doubt failed to realise the possibilities of its growth. The total capital expenditure on street widenings and improve-

ments had been 2,318,043. The outstanding debt amounted to 2,092,044., equal to a charge of 1s. in the pound for interest and sinking fund charges. The total length of street widenings and improvements and new streets carried out by the City Council in a period of about forty years was over 36½ miles. This was exclusive of widenings carried out by owners of land at their own expense. The buildings erected during the last few years were generally on a much larger scale, often of considerable architectural merit, and the city had consequently gained largely in this respect. Although these improvements had resulted in the possession of many streets and buildings of which Leeds was justly proud, it could not be argued that reconstruction was as satisfactory as construction properly planned in the first instance, apart from the extremely heavy extra cost. One was bound to realise that in some cases there had been no design beyond street widening and better travelling facilities, no *motif* beyond the wider streets and the better buildings which had followed the widenings, and some of the fine new buildings had been erected where it was impossible to appreciate properly the full beauty of the architect's creation. In the matter of width it was impossible to satisfy different interests. Often one heard the opinion expressed by shopkeepers that a street must not be widened beyond quite a limited amount, or it would be ruined from their point of view, whereas the tramway and other traffic called for much greater width to cope with the needs of the travelling public. Experience in Leeds proved that a bold policy in the width of streets was best. The number of parks and recreation-grounds was twenty-eight, and three more were leased for long terms of years. The total area amounted to 1,171 acres, equal to about 10 per cent. of the built-up area of the city. The total capital expenditure had been 549,639., and the annual charge was 30,817., equal to a rate of 3.47d. in the pound. The cost reached a formidable figure, but the reduction in the death-rate (largely attributable to these works), the greater convenience obtained, and the justifiable increase in pride in the city should reconcile most of the inhabitants to the heavier demands made by the rate collector.

LAW REPORTS.

HIGH COURT OF JUSTICE, CHANCERY DIVISION.
(Mr. Justice Eve.)
Dispute as to a Party Wall.

Carden v. Layton.

THIS action came before his lordship on Friday, July 7, on motion by the plaintiffs, W. A. Carden, A. J. Carden, and Charles Stubbs Layton, suing as trustees of the will of the late Wm. Carden, against the defendant, W. F. Revill Layton, of Hampton Hill. The plaintiffs asked for an injunction to restrain the defendant from cutting into, under-pinning, raising, thickening, or otherwise interfering with, or trespassing upon, the party wall on the south side of the plaintiffs' premises, No. 19, Goswell road, Finsbury, without complying with the procedure laid down under the London Building Act, and also a mandatory order on the defendant to pull down the wall he had built.

Mr. Clayton, K.C. (with him Mr. Cozens-Hardy,) said that in answer to the affidavit filed in support of the motion the defendant had filed evidence which raised a conflict of fact. There were matters as to which there was no dispute, which he (counsel) thought would entitle the plaintiffs to some relief on the facts. The plaintiffs had offered to let the motion stand over with a view of an early date being fixed for trial, but the defendant was not prepared to assent to that. The facts of the case were that the defendant's property was on the south side of plaintiffs' building, and he commenced to cut into the party wall and he commenced consulting the plaintiffs, who were the freeholders. He had given notice, however, to the leaseholders, and he had gone on with the wall to a height of 8 ft. 6 in. above the level of the pavement when the plaintiffs objected, and he then gave a verbal undertaking not to proceed with any work in connexion with the wall without the plaintiffs' consent. On June 6 plaintiffs discovered the defendant had carried the wall to a height of 19 ft., and plaintiffs' contention was that such wall was in

part bonded into the party wall. The defendant had also inserted a girder, which he said was a ledger, and his contention was that the wall he was building was a separate wall. There was a dispute as to that, but it was most important for the plaintiffs to be able to see whether the start of the wall was right, and they wanted to make some excavations in order to see that the thickening that was done before any undertaking was given was done in such a way as to be a proper foundation to the rest of the structure. This question was whether the building so far as it had gone up should be exposed so that the plaintiffs could see exactly what was there. Mr. Clayton submitted that the defendant infringed the common law rights of the plaintiffs before he gave notice. It was desirable that the case should be taken with witnesses so that his lordship should be able to decide as to the verbal disputes. Counsel added that in accordance with the provisions of the London Building Act each side had appointed a surveyor, and Sir Alexander Stenning had been appointed umpire, but the arbitration proceedings had been postponed pending the present application.

Mr. Lawrence, K.C.: I suggest that the arbitration under the Act should go on.

Mr. Clayton: My difficulty is that I want to see that the work already done has been properly done.

Mr. Justice Eve: Cannot you agree upon some gentleman to inspect the work and report upon it, and then allow the arbitration to proceed?

Mr. Lawrence: I am willing.

Mr. Justice Eve: Why not let the umpire report to the Court whether the work has been properly done, and for that purpose the defendant will give him all facilities.

After further discussion it was agreed that by consent Sir A. Stenning should be appointed to report to the Court whether the work already done had been done properly and in accordance with the requirements of the London Building Act, and for that purpose he should be allowed to make any necessary excavations or pulling down to expose the work done.

Mr. Justice Eve: There will be liberty to apply when the report is received, and the motion in the meantime will stand adjourned.

Contractor's Action against Building Owner.

MR. MOIR MACKENZIE, High Court Official Referee, began on July 5 the hearing of an action by Mr. Frederick George Minter, a contractor living in Wimbledon, against Mr. Charles Waldstein, a Professor of Fine Arts at the University of Cambridge, in respect of certain payments alleged to be due to Mr. Minter under a building contract involving the pulling down and reconstruction of Newton Hall, near Haslemere, five miles from Cambridge.

Mr. Lewis Thomas, K.C., supporting the claim, said that Professor Waldstein selected to carry out his wishes Mr. Frederick William Foster, a well-known architect, as well as to assist in brick, stone, and timber, and who had carried out a great deal of very high class character for millionaires like Mr. Alfred Rothschild. Bills of quantities were subsequently prepared and specification and designs carried out. The contract was entered into on February 3, 1910, and the contract price for the building was £12,975. The building was to be finished within six months. The work was immediately entered upon and carried out without any hitch or difference between the employer and the architect or between the contractor and the architect right up to January of this year.

There were complaints from the defendant after that date as to alleged defective work. Subsequently Mr. Waldstein paid the plaintiff £1,500, under the architect's certificate, under protest. Another certificate for £2,750 was issued. This was the amount sued for in these proceedings. The defendant had alleged, amongst other things, that a considerable amount of work was not authorised directly or indirectly, and that a considerable amount of work was defective, and that the plaintiff's prices were excessive. Mr. Minter was quite prepared at any time to repair defects if only told what they were. Counsel mentioned that the defendant, a gentleman with æsthetic tastes, wanted the new building to look as much as possible like a building in the reign of George I.

Mr. Lewis Thomas further pointed out that from start to finish the work was carried out under the supervision of a resident clerk of the works, under whom Mr. Minter had been told to take his instructions. The defendant had in these premises installed seventy-four heat radiators and their attendant pipes—there were 140 ft. of hot-water pipes. Mr. Waldstein had followed what Mr. Thomas described the stupid American plan of "broiling the house out."

Mr. Waldstein had, too, wanted done, work

which to be done satisfactory should have taken from nine to twelve months, but Mr. Waldstein had insisted on having this contract carried out in a period of six months. The defendant had alleged, amongst other things, that the roof was of unsound construction and workmanship, and that there were settlements, that the drainage system was defective, that brickwork was bad, and that the mortar was inferior. Throughout the whole building, said Mr. Thomas, there were matters which had the appearance of being serious and important, but in all these details shown in defence there were a series of complaints which the merest tyro in a builder's office would be astonished to see listed, still less men of greater experience. His client had done all that he had contracted to do. There were in detail in these paragraphs of defence 228 items, and one could boil them all down into two items. One concerned the roofing, and the other had relation to joists and flooring. Counsel submitted that for certain of the defects—if they existed his client was not responsible, and, as for the others, he would call evidence to refute the defendant's allegations. Counsel added he also disputed the defendant's suggestion that he had at any time revoked the authority of Mr. Foster to act on his behalf. In the course of further references to the defendant's allegations, Mr. Lewis Thomas insisted that at the defendant's own wish variations from the drawings and specifications were made. He instanced alterations that he said had to be made in connexion with a bell-turret on the roof, so that it might be seen from all parts of the estate, and satisfy Professor Waldstein's liking for artistic effects. Counsel considered that the way in which the figures in the counterclaim were made up was really laughable when one came to analyse them.

Mr. St. John Morrow (counsel for the defendant): We have heard that before, Mr. Thomas.

Mr. Lewis Thomas: Perhaps you will begin to appreciate it, and then withdraw your counterclaim. Reverting to the allegation that Mr. Waldstein had overheated the house by radiators in order to take up residence there all the quicker, Counsel mentioned that Mr. Foster had wandered about the country in search of the beautiful and antique, and he thought that some old panelling he had seen would be an enhancement of the Professor's dining-room. He sent it down to Newton Hall, and it was erected so as to improve and beautify the dining room. So great was the heat put on in this building that this old wood paneling had been split. Counsel suggested that certain of the alleged defects could be put right for a few pence. As for others, neither Mr. Minter nor the architect, Mr. Foster, had had the opportunity of putting them right.

Mr. Green was there with authority to give Mr. Minter directions on behalf of Mr. Foster. The correspondence showed Mr. Green to be the alter ego of Mr. Foster. Just as Mr. Foster acted by Mr. Waldstein's authority, so Mr. Minter had acted under Mr. Green's instructions. Counsel submitted that at the time Mr. Foster gave his certificate for £2,750, odd that certificate was for money earned, and to which his client was entitled in any event.

Mr. Frederick Albert Minter, who said that he had been with his father eight years, and who took charge of the work at Newton Hall, gave evidence in support of the plaintiff's case.

He said that the ordinary time to carry out a contract of this kind was twelve months, but owing to the short time they were allowed, certain parts of the work had to be unduly hurried. The witness added that Mr. Foster told him he was to work under Mr. Green's instructions, and that any points that wanted settling he was to go to Mr. Green to settle them. Mr. Foster had told him that Mr. Green was a qualified architect. Witness took Mr. Green's instructions for variations and extras. When Mrs. Waldstein asked for certain things to be done he told her they were in the nature of variations and extras, and that the clerk of the works must be told.

The case was proceeding when we went to press.

WESTMINSTER CITY COUNCIL.

At the fortnightly sitting of this Council on July 6 the following amongst other matters were dealt with:

Piccadilly-Circus Rebuilding.—The Improvements Committee brought up a further report dealing with the application of Mr. J. Murray, F.E.I.A., for consent to the proposed new building lines for portions of Glasshouse-street, The Quadrant, Piccadilly, Piccadilly-circus, and Regent-street, W. The plan showed a straightening of the building lines on both sides of Regent-street from Jermyn-street to Piccadilly-circus, certain land being given up

to the public, and other land being taken from the public way. The corner of Messrs. Swan and Edgar's premises is proposed to be set back some 10 to 12 ft., and the land added to the public way, while a small strip on the south side of the Quadrant is to be taken from the footway. The plan also showed a rebuilding of the existing columns of the County Library Office in slightly altered positions, and a slight setting back of the building line on that side of Regent-street, while it is proposed to provide a short passageway for foot passengers under the corner, at the junction of Regent-street and Glasshouse-street. A narrow strip of land on the south side of Glasshouse-street is taken from the footway at that spot, while a small strip is given up to the public way. The Committee recommended that the Council disapprove of the proposed new building line of Mr. R. W. Grailley Smith proposed as an amendment that the Council do approve of the new proposed building line, and appeal to the meeting not to adopt a "dog-in-the-manger" policy, and so jeopardise a great principal improvement. The amendment was carried by a considerable majority.

LONDON COUNCILS.

Barnet.—A plan has been passed for Mr. W. C. Weymouth for St. Peter's Vicarage, Arkley.

Bermondsey.—The following plans have been passed: Messrs. Barlow & Roberts, 15 Redcross-street, Southwark, five shops and houses, Tower Bridge-road; Messrs. J. A. Stracey & Son, 152, Ports-road, S.E., for Dr. Salter, Richmond, Stratton, and Goldie, additions to 82, Southwark Park-road; Mr. W. Harbrow, South Bermondsey, for the Commissioners of Police, New Scotland-yard, S.W., alterations and additions to 67, Upper Grange-road.

Craydon.—Application is to be made by the County Council to the Local Government Board for sanction to borrow £4,500, for carrying out works in connexion with the Norwood Junction subway. Plans, specifications, and estimates are to be prepared for the construction of a relief road from Thornton Heath to Purley via Thornton-road, Wadden March lane, Wadden Court-road, and Coldharbour lane. The following plans have been passed:

Mr. C. H. Taylor, 9, Bingham-road, twelve houses, Lower Addiscombe-road; Mr. P. Richardson, 2, Malvern-road, half St. Saviour's-road; Messrs. Chesterton & Sons, Nabour, three houses, Strathely-avenue; Mr. C. S. Banks, 16, Oakfield-road, fourteen houses, Turrell-road; Mr. W. Hine, Morland-road, four houses, Lower Addiscombe-road; Mr. D. Waller, Old Palace-road, warehouse, North end; Messrs. Burberry & Wooldridge, 112A Churchill-road, additions to hall, Thornton-road, St. Jude's; Mr. C. H. Ridge, 84, High-street, motor garage, rear of 110, High-street; Mr. H. W. Pratt, London, E.C., hall and class rooms, Brighton-road, Purley.

East Barnet Valley.—According to a resolution moved by Councillor Ford, the Surveyor has been instructed to prepare plans and the cost of providing public swimming baths, and other baths on land in Lancaster-road. A plan has been passed for the Society of Friends for a meeting-house in Waterfall-lane.

East Ham.—The Engineer has been instructed to prepare plans and estimates of the cost of constructing three ladies' conveniences to be erected in Station-road, High-street South, and Barking-road. FOREIGN AND COLONIAL.

Openings for Concrete Machinery.

The American Consul in Johannesburg reports that concrete mixers are now quite essential to builders and contractors in South Africa. Practically all the machines in the Transvaal are of American manufacture, and the Consul says that, as unusual activity is likely to prevail in the building trade for the next few years, there is every probability that concrete mixers will find a ready sale. The hint is one that we hope will not be lost on British makers of such plant.

The American Consul at Dundee reports that machinery is rarely used for mixing concrete in Scotland, largely owing to the fact that the sale of concrete mixers has never been pushed there. Hence he recommends Scotland as a likely field for American enterprise. As the use of reinforced concrete is making rapid headway in North Britain, and various public works involving the employment of concrete on a large scale are now in contemplation, some of our readers may find it advantageous to strengthen their representation in Scotland.

Metal Partition Walls, Germany.

It appears from a report to his Government by the United States Consul-General at Berlin that most of the inner partition walls used in buildings in that city consist of a heavy iron wire screen, on either side of which are layers of coke-ash mortar. The walls are apt to get out of plumb, and will not hold nails satisfactorily, and as in making the mortar cat- hair, iron, and hemp refuse are used, it some- times disintegrates, causing the wall to crumble and sections to fall out. A good metal partition wall should therefore, says the Consul-General, find a market in Germany, provided that it was not too thick, and that the cost was not very much greater than that of the ordinary wall. Economy of space is looked for by the German builder. The authorities require that all outside and supporting walls shall have a thickness of at least 36 cms. (14.173 in.), and hence partition walls are generally limited in thickness to 10 cms. (3.937 in.), as they are not required to support

great weights. The coke-ash walls cost about 320 marks per square metre (about £s. 8s. 6d. per square yard), but builders would pay more for a wall of satisfactory construction. Prices should be quoted in marks per square metre l.o.b. German port.

Building Material, Austria-Hungary.

The following particulars of projected works in Austria-Hungary are extracted from the *Oesterreichischer Zentral-Anzeiger* (Vienna):—The city authorities of Budapest have decided to proceed with the erection of ten school buildings at a total cost of 6,180,000 kronen (257,500l.). The Budapest Spa authorities ("Heilbäderkommission") have accepted the plans for the erection of an hotel containing 100 rooms: the cost is estimated at 1,500,000 kronen (65,700l.), and work is to be commenced at once. The "Militär-Versicherungsgesell- schaft" has decided to commence operations in the autumn of 1913 for the erection of a palatial building in Budapest at the corner of Karlsering and Dohánygasse; the cost is assessed at 5,000,000 kronen (208,000l.).

Building Material, Switzerland.

The *Feuille Fédérale Suisse* of June 23 contains a decree opening in favour of the Federal Council credits amounting to 837,000 francs (33,480l.) for the purpose of enlarging the ordinance factory at Berne, and for its equip- ment with the requisite additional machinery.

PATENTS.

APPLICATIONS PUBLISHED.*

11,858 of 1910.—James Gordon: Flush-bolts.
14,287 of 1910.—Charles Leslie Newland: Water supply of flushing cisterns.

THE EDWARD VII. MEMORIAL: THE NEW SITE.

IF the Memorial Committee imagine that they are at the end of their difficulties in having adopted the north end of the Green Park "Broad Walk" as the site of a memorial statue to our late King, they are, we venture to think, seriously out in their calculations. If we are to assume that a portrait statue is to be embodied in the memorial, and the Committee's report certainly appears to suggest this, the site chosen is a most difficult one to deal with. The difficulties may not prove insurmountable, but the first essential

in taking any steps towards a satisfactory solution is the recognition of their existence. To begin with, the Broad Walk is obviously designed to afford a view of the Victoria Memorial from Piccadilly, and it is obvious that for one person who views the memorial from any other point there are a dozen who see it from this. The first necessity, therefore, is that this axis of this vista should be free, and how is it possible to place a portrait statue in any other position than the central axis of the monument? Suppose, however, that we sacrifice this vista and

substitute for the more distant Victoria monument a nearer one to King Edward. If the statue of the King is to face towards Buckingham Palace he turns his back on Piccadilly, from which road most people will view the monument, while, if he faces Piccadilly, his back is turned on Queen Victoria. The difficulty is the same whether the portrait statue crowns the monument or not, and we can hardly conceive it to be within the power of even our ablest sculptor to design a statue facing both ways—the only solution that would meet the case.

Clearly the proper site for such a monument in this location would be the north side and not the south side of Piccadilly; a statue here, with a fine architectural background, would be impressive both from Piccadilly and the Park, but this would involve the purchase of valuable properties beyond the means the Committee have at present at their disposal.

The difficulties we have cited are but a few of those that would present themselves to the artist called on to prepare a design for this site, and we can only reiterate our previously-expressed opinion that the only course likely to secure a satisfactory solution is an open competition. The suggestion that such a competition would exclude the best men is absurd; they could be retained by more than one method if necessary. But we confess that our faith in the so-called "best" men has been at times seriously shaken. It argues a very pessimistic view of the future of our country to assume that men of the coming generation are not at least as able as the preceding one, and if we were asked to say whether we would hope for a better result from a competition between, say, a dozen men who have achieved public recognition or from one between all those who have yet to achieve it, we should be inclined to put our faith in the latter. The British attitude of caution renders the path to recognition a long and arduous one, and before achievement is widely acknowledged a new generation has sprung up capable of effectively challenging the ideals of its predecessors. For this reason we maintain that every opportunity should be afforded for the younger man to show what mettle he is made of. Moreover, we doubt if the artist, however eminent he may be, who is not sufficiently interested or public-spirited to engage on a design for such a memorial unless his commission is assured, is the man that should be employed under any circumstances for a work of this character. We should have thought the Advisory Committee would have been cured of their blind faith in the system of commissioning a sculptor to control the form of the memorial. Their last scheme was wrecked by the mistaken idea of their nominee as to the type of monument the site demanded no less than by the insidious attempt to eliminate architectural control, and it might have been imagined that the lesson would have been taken to heart. As it is this unfortunate experience seems to have taught them nothing.

We should naturally claim that the matter of this memorial is primarily an architectural one, but the advantage of a properly-conducted competition is that by this method the question settles itself. With the jury formed for the purpose of appreciating the question from all the aspects involved, the selected design may be the work of a sculptor, or an architect, or of both, the sole reason for its adoption being that it is absolutely the most artistic solution of the problem. We are more than ever convinced that unless such a course is adopted it can only be a lucky fluke if the memorial escapes being counted as another of our too numerous failures in this direction.

ST. PAUL'S BRIDGE BILL.

DESPITE the fact that this Bill is now passed by the House of Commons and that the City has triumphed over the almost unanimous view of artists throughout the country, it still remains to us to draw attention to the happenings of the last week and to the means by which the Royal Institute of British Architects and others opposing the Bill have been outmanœuvred.

If we may judge by a leading article in the *Times*, public opinion has not grasped the meaning and significance of the evidence given by the three architects who appeared before the Select Committee on behalf of the Corporation. There is a danger that the public may think their evidence is entirely in favour of the scheme. This we feel bound to point out is not a correct description of the position. It is most essential to realise, in justice to these architects themselves, that we are not entitled to infer from their report that they were asked to give their independent advice on the whole situation or on the underlying traffic ideas which prompted the scheme. It is only fair to them to assume that they were simply retained by the Corporation to make suggestions and to give their opinion within certain definite limits which involved the acceptance of the underlying idea—upon which their report expresses no opinion. Had these gentlemen been asked to put this scheme out of their minds, to consider the whole problem afresh from the beginning, and to produce the best scheme they could, there is no doubt a better one would have resulted, and it is this better scheme that the situation called for. It is not to be supposed that they would wish the public to think that they considered this scheme a complete and satisfactory solution of every aspect of the problem or that they themselves are not capable of producing a better one.

There is also a danger that the attitude of the Institute may not appear quite clear. We understand the Institute expressed its approval of the action of the Corporation in consulting three of its members on the assumption that they were to be consulted as independent experts on the whole situation and that their advice was to be sought as to the means of proceeding to obtain the best possible results, and not that they were to be simply retained to report within the limits of a reference which granted certain premises entirely destroying the value of the report as an expression of independent opinion on the root idea of the scheme. This fact, we think, should be thoroughly grasped in justice to all concerned. If we read the report in the light of the fact that it is all based on the assumption of the necessity for a through traffic route at this spot, many opinions and conclusions it contains appear reasonable which otherwise most people would be disposed to question.

We must not forget that the architects do not seem to have been asked whether it was necessary to create this through traffic route at all, or whether the traffic could not have been relieved by developing Blackfriars as a main through traffic artery and creating a

local traffic bridge from St. Paul's to Southwark to relieve the other bridge of local traffic and make it possible to get rid of the danger of the tram tunnel at the Cathedral and approach it in an architectural manner. This and other such ideas seem to have been outside the terms of reference, but they are just the questions which lie at the root of the whole problem and upon which town-planning advice was so necessary.

Once take the need for a new through traffic route in this position for granted and start off with the preconceived idea that this is the dominant factor in the scheme, and it becomes easy to accept the bridge over Queen Victoria-street as an essential condition of a satisfactory scheme and to look upon the approach to St. Paul's as "at the best a secondary aim," but these are just the points which an independent report on the whole situation would not have taken for granted.

It cannot be assumed that the Institute in accepting the appointment of its three members thereby shows an approval of the scheme or that general professional or artistic opinion has been appreciably altered by the late events.

We can now only accept the accomplished fact and turn our energies in the direction of endeavouring to secure that the bridge and its approaches, however wrong it may be in conception as a scheme, shall as far as possible save itself from the worst by assuming decent architectural form and proportions. The larger question as to the methods at present employed for the initiation and critical investigation of schemes of such far-reaching public interest as this remains to be dealt with, but its importance justifies us in reserving it for consideration in a future issue.

NOTES.

East London Memorial to King Edward.

WE most heartily sympathise with the Bishop of Stepney's suggestion that the derelict Stepney Fish Market and adjacent land should be converted into a public park and river-side terrace as a memorial to King Edward in East London. The size of London justifies this course, and the site, while it would afford as suitable a position for a monument as any other in the East End, has the additional advantage of providing a park where it is badly needed, and one that, fronting the river, is of greater value than its actual area of eight acres would suggest. Besides this there is the gain of opening up the view of the Thames with its picturesque incidents of passing traffic.

The Natural History and the New Science Museums.

THE increased demands of the Scientific Collections at South Kensington is apparently necessitating the curtailment of the ground at present occupied by the Natural History Museum. At the time this museum was built it was evidently not anticipated that the land between the Albert Hall and Cromwell-road would be built on to the extent that subsequent requirements have rendered necessary, and a liberal space was left on all sides to the great advantage of the effect of the

outh end of this area. Now it is intended to form a road close to the back of the Natural History Museum, thus preventing the possibility of that building extending northward at any future time. As the building is planned this could have been the natural direction for any enlargement, but it is possible to substitute extensions on the east and west, and though these would modify the architectural effect of the building we do not think they would be seriously detrimental to it. Sir Norman Lockyer, in a contribution to *Nature*, suggests various ways in which the proposed scheme could be improved from the point of view of the requirements of the existing and the proposed museums. These suggestions do not, however, materially affect the architectural aspect of the question except that his amendments would tend to preserve intact the open spaces east and west of the Natural History Museum; from this aspect they are certainly deserving of consideration quite apart from the practical contentions.

The South Kensington Site.

THE official proposal referred to in our previous "Note" involves cutting another 60-ft. road between Exhibition Road and Queen's Gate. Now, we are not disposed to say that under the present conditions some such road may not be desirable, but most assuredly it does not add in any way to the architectural impression created by the site as a whole. From the very first the entire area, which might have been made one of the most striking features of the Metropolis, has been treated in an unintelligent manner that emphatically condemns the system of saving artistic problems in the control of the official. Instead of preparing a comprehensive scheme by which the various buildings could have been brought into architectural relationship with each other the site has been parcelled out piecemeal as demands for it came along, and the only consideration that appears to have dictated the positions of the roads was the necessity of giving access to the buildings for which sites were allotted. Given a large oblong with a building of the mass and importance of the Albert Hall at one end, anything more inept than its intersection by a series of cross roads with the principal buildings all strung along the central axis can hardly be imagined.

The New Rooms at the National Gallery.

THE rearrangement of the National Collection, which promises to make it one of the most perfect galleries in Europe, proceeds apace. Within the last few weeks four galleries and a cabinet gallery (which you enter directly from the right) have been opened to the public. The masterpieces of Dutch and Spanish art are now on view—the works of Velasquez, Rembrandt, Murillo, Franz Hals, and others—seen to excellent advantage. The colour of two of the galleries is olive green, while those in which the works of Rembrandt and Velasquez are hung, is of old gold. The green, we consider, on the whole, to form the better background, more especially perhaps in the

case of Rembrandt, the effect of whose colour schemes is somewhat diminished by a mass of wall colour of something like approximate tone. The pictures are admirably spaced: the effect of each work is considered; there is no antagonism between those placed in juxtaposition, either in colour or in pictorial idea. The light, however, in the cabinet gallery is quite inadequate, and reduces to an absurdity the hanging of pictures on the wall at each side of the window, as they cannot be seen. And in Gallery No. XIV. it is surely a little disrespectful to the memory of a considerable painter to place the works of Goya in an almost inaccessible corner, from a spectator's point of view, behind a door!

Ozone Water Sterilisation.

CONTINUED progress is being made in the adaptation of ozone to the purification of drinking water for the supply of towns and cities. Apart from examples in America, the ozone plants at Chartres, Florence, Hermannstadt, Nice, Paderborn, Paris, Villefranche, and Wiesbaden are sufficient to demonstrate the scientific and commercial success of the system, whose claims have been further recognised by the decision of the Paris Municipal Council to install two additional plants each of 9,900,000 gallons output daily, and by the 11,000,000 gallon plant recently completed at St. Petersburg. The latter has been installed at the Penkowaja Waterworks, drawing supplies directly from the Neva. Before treatment by ozone the water is clarified and rapidly filtered to remove impurities in suspension. The clarifying process is conducted on the American system involving the use of alum as a coagulant, and filtration by a series of Howatson mechanical filters, where crushed flint takes the place of sand. The ozone plant was constructed by the Russian Siemens and Halske Company and has fulfilled all expectations. It is stated that the water now supplied is clear, pure, and healthy in every way, the bacteriological records being particularly satisfactory.

Gidea Park.

In another column will be found a letter dealing with the methods adopted in regard to the competition for small houses at Gidea Park. Many of the criticisms it contains amply justify the demand for an investigation as to whether these methods are not likely to divert architects from their legitimate aims by entangling them in the complications of speculative commerce. We think this point of view may not have struck the promoters at the time the competition was organised, and certainly it did not come within the purview of the assessors, whose duties were limited to the means to be adopted to secure a fair adjudication, so that they should not, as our correspondent seems to think, be regarded as in any way responsible for the commercial relationship between the promoters and the competitors.

ST. ANDREW'S PARISH CHURCH.

Two memorial windows have been fixed in the Hunter aisle of this church. They depict the Baptism and the Agony, and form two of a set of four representing scenes in the life of Christ, and were designed by Mr. Louis Davis.

THE LONDON SALON.

THE Allied Artists' Association, Ltd., whose fourth exhibition is now being held at the Albert Hall, have chosen in the London Salon a somewhat ambitious title for their show. The Independents in Paris, or the Secessionists in Vienna, have been much more modest in this respect, while their aim has been higher. When we get a Salon representative of London art it will, we expect, be a very different affair from this. So far, indeed, as British art is concerned it is largely an exhibition of the "great rejected," the work of painters whose ideal is perfectly in harmony with the tradition known as academic, but with no new impulse, no new note, and, generally speaking, with a vastly inferior execution. The exhibitions of the foreign painters to which we have referred are, perhaps, in part composed of works which have been refused at the official galleries, but, in so far as the Secessionists at Vienna are concerned, the works have not been thrown out in consequence of any inadequacy in fulfilling the academic standard, but because the aim is essentially different from the academic aim. It is, in a way, an exhibition of protest. And so it is with the much larger, much wilder collection of the Independents in Paris. The spirit of protest there shrieks from every wall. At Vienna the small group of artists are held together, broadly speaking, by their antagonism to a formula which places limits on individual expression, on research, and on experiment. The training and capability of the artists are not in dispute. It is all a question of point of view. The wish of the Independents is altogether on another plane. This show is the largest in the world, and its democratic, or rather anarchical, character is established by the freedom of its rules, if anarchy admits of any. Outside Paris, and not always there, the pictures are not taken seriously. But journals of the standing of the *Gazette des Beaux-Arts*, for instance, open their pages to an elaborate and thoughtful consideration of the work. Wildly extravagant, farcically puerile, indeed, as many of the pictures may be, we are not out of sympathy with the point of view which hesitates to dismiss the exhibition as of no concern. What country is there but France, what city but Paris, that could provide such a boundless expression of artistic extravagance, of *naïveté*, of at once incompetence and ability? If the Quartier Latin of Murger's time no longer exists, its spirit is still abundant, and this is, after all, a spirit which, in the course of time produces the great painters and sculptors of France. If the show of the Independents is a nursery in which the din and tumult are a little deafening, a little beyond the decencies of a well-ordered establishment, there emerges now and again out of the racket a voice which commands attention. The *raison d'être* of such an exhibition is plain; its useful purpose in the republic of art obvious. It is not, on the face of it, a training ground for future Academicians, but it often proves to be so in effect. The work of many of the older Independents, for instance, is esteemed at the Salons. Although the London Salon is established on sufficiently broad lines, it possesses little, if anything, of the character of the Paris group. Apart from one or two foreign artists of distinction, and a very small body of English artists (most of them women), the free and independent spirit of the youth of Paris is lacking. A complacent adherence to the academic ideal is the dominating note of the vast majority of the works. And complacent mediocrity is more disturbing than fantastic incompetence. The protest, if protest there be, is against the selection of a hanging committee, not against an artistic method or point of view. The exhibition may be of some advantage to the artists who have not had the opportunity of seeing their work hung in a large gallery with other pictures. The sort of detachment which this view engenders may enable them to

discover certain very obvious limitations. But we have no wish to throw cold water on the exhibition as a whole. As yet, perhaps, the society is too young to have discovered in itself the elements which make for genuine interest and vitality. These will, no doubt, gradually assert themselves. And, as we have indicated, there are pictures at the Albert Hall which are well worth a visit. M. André Chapuy, M. Machkoff, Miss Keimann-Meltzer, and Mme. René Finch are among the foreign artists who show work of more than ordinary attraction, while Miss Lilian Lancaster, Miss Nesta Wells, Miss Leggett, Mr. A. H. Hudson, and Mr. E. H. R. Collings provide the most important work by English artists.

THE NEW CHAPEL OF THE KNIGHTS OF THE ORDER OF THE THISTLE.

This chapel, by Mr. R. S. Lorimer, A.R.S.A., F.R.I.B.A., which we illustrate this week in a manner in accord with its architectural quality and importance, was opened by his Majesty the King on Wednesday, 19th. In its lay origin the chapel is an instance of the good results of the diversion, under competent judgment, of the word of a bequest, if its spirit be followed by a generous heir.

The late Lord Leven and Melville left a sum of 40,000*l.* to be applied by his trustees, should the King be pleased to accord his necessary permission, to the purpose of "putting into repair and restoring the Chapel at Holyrood Palace so that it can be used as a Chapel for the Order of the Thistle." He made the bequest conditional on the consent and ability of Sir John Stirling Maxwell and

Lord Balcarres to act as executors of this part of his will. He also named an architect for the work. By the terms of the will, if the architect could not act, or if any impediment came in the way of the terms of his will being carried out precisely as specified, it was provided that the 40,000*l.* was to revert to the estate. Lord Leven and Melville died in 1906. The trustees, after considering the project, reported most strongly against any attempt being made to restore Holyrood Chapel, as "restoration" would have involved almost entire reconstruction. Prof. Lethaby was asked to give his opinion, and found himself in accord with the trustees. The scheme being opposed by those entrusted with its execution was, therefore, abandoned, and the money reverted to the Leven family, and on all hands it was assumed that no more would be heard of it. It is known that this turn of affairs occasioned disappointment to King Edward, who had long cherished the idea that the Knights of the Order of the Thistle should have a chapel of their own. In a manner as unexpected as it is certainly unusual, the young Lord Leven and Melville, making himself heir to his father's intent, came forward and placed his portion of the diverted 40,000*l.* (an amount of about 24,000*l.*) at the disposal of King Edward, for the purpose of building a chapel for the Order. His two younger brothers afterwards associated themselves with this generous action. The King thereupon called together a Chapter of the Knights of the Thistle, and from among their number appointed trustees to carry the project into effect. In March, 1909, the Dean of the Order of the Thistle, the Very Rev. Sir James Cameron Lees, D.D., submitted to the Kirk Session of St. Giles (where he was then the minister) a letter from Lord Knollys, written on behalf of the King, suggesting that stalls or a chapel

should be constructed in connexion with the Cathedral. The Kirk Session replied that it was honoured by the proposal, and the Cathedral Board of Management and the Ecclesiastical Commissioners were equally well disposed, and in April Mr. Lorimer was appointed architect.

The opening ceremony on Wednesday and the meeting of the Order, at which, it is reported, the members sat in solemn conclave, are occasions of some historical interest. "The Most Ancient and Most Noble Order of the Thistle," though analogous in character to the Order of the Garter, is not its equal in point of antiquity.

According to "Burke," the Order of the Thistle was "revived" by James II. of England (VII. of Scotland) in 1687, but it is doubtful if the Order existed as any very definite body before that date. After the Revolution nothing more was heard of the Order until it was restored by Queen Anne at the end of 1703. Since then it has maintained an honourable and continuous existence, though the Knights have never until now had a chapel in which to hang their banners. It is also said that never in its history has the Monarch presided at the investiture of any of its Knights.

In connexion with the opening of the chapel King George invested two new Knights, and for this purpose the sword of State which Pope Julian presented to James IV. was used. And a great concourse of Peers and Lieutenants and Officers and Sheriffs assembled in St. Giles's. For the chapel itself is not of any great size. It was found that no adequate scheme could have been carried out within the existing walls of St. Giles's without interfering with the congregational uses of the church. Also, owing to the disposition of the lighting of St. Giles's and the plan of the church generally, the chapel could only have been placed where it is—that is to say, on the south side, beside the choir. As the size of the chapel in width and length was necessarily limited in order that it should not block up Parliament-square, a dignified and stately effect was aimed at by giving the chapel great height in proportion to its other dimensions, the internal dimensions being: Length, 38 ft.; breadth, 18 ft.; and height, 42 ft. to the apex of the vaulting.

Even as we saw it, lacking the ceremonial concourse, the aspect of the interior is sufficiently gorgeous and complete. Our illustration (the photographs are by Mr. Francis C. Inglis, of Edinburgh) gives a fair idea of the east end, with the chair of investiture in the centre. The linen-fold panelling, which lines the apsidal end, is peculiarly successful in point of design, execution, and the quality and colour of the wood. Throughout the woodwork the clear-cut but by no means inhuman precision of the workmanship upholds the freshness of the design. The chair of investiture is placed on a granite step, and the lion and the unicorn on the octagonal uprights on either hand can be distinguished, and on either side of the chair the hanging lamps of wrought steel in the form of an angel holding a torch, with pendants of the "Pelican in her Piety" (a device which recurs frequently, being symbolical of knightly virtues) in spherical form, below. On the right hand is seen the Dean's chair, with its plain *prie dieu*; on the left the lectern, with four "buttresses" terminating in the emblems of the Evangelists. The underside of the canopy of the chair is richly panelled and carved, and in a niche is placed an allegorical winged figure, with a spear, treading on and overcoming the dragon, Evil. The canopy is octagonal in form. This view is the one in which the floor is seen to best advantage. It is of Ailsa Craig granite, varied in colour, set in a simple pattern, with squares at regular intervals of Iona marble. It forms an admirable complement to the brown woodwork and light-coloured stone. The quality of the woodwork is perhaps best seen in our detail view of the King's stall at the west end, and it is

The Chapel of the Thistle, Edinburgh: Entrance from the Ante-Chapel.
Mr. R. S. Lorimer, A.R.S.A., Architect.

necessary for us here to expatiate on it, as upon the merit of the design. Suffice it that in the actuality there is the pleasure of colour and of a satisfaction of the sense of closeness and worth of work and material which a photograph can hardly convey. The only existing examples of ecclesiastical stonework in Scotland of any importance are the few stalls at Dunblane Cathedral and the woodwork in King's College, Aberdeen. Consequently, the architect, though inheriting tradition, was left almost unaided and free, and the design, as eventually worked out, was evolved partly from drawings, partly from models, a large shed being erected in the building-yard, where models were prepared—the design growing and changing as possibilities and limitations became apparent to the architect and the carvers, with whom he has worked continuously for the last fifteen years. The decorative motives employed, where they are not heraldic or appertaining to ecclesiastical allegory, are drawn from themes in nature—the thistle, the vine, the rose, the corn, and so forth, so treated as to make a coherent scheme of natural symbolism throughout.

The stalls on which the Royal stalls at the west end are set is about 1 ft. 4 in. in height, His Majesty's seat in the centre being a little higher than the Prince of Wales' the Duke of Connaught's on either hand. Above, the "stepped" arrangement of canopies, seen best in the view showing the whole chapel, is happy in the effect of its additional dignity to the Monarch's seat. In this canopy may be seen St. Margaret of Scotland leading children, hidden in the

photograph, are St. Kentigern, with the model of his cathedral, and St. Columba in full canonicals, and with the robin perching on his wrist. The height from the floor to the top of the King's canopy is 33 ft., whereas that of the side stalls is only 25 ft. Each is surmounted by the "achievement" of the Knight for whom it is destined, consisting of the sword and helmet, the coronet and crest, and the mantling peculiar to the knight concerned. These achievements, in combination with the stall-plates in Champagné enamel by Mrs. Traquair, give colour and an ordered variety of inestimable value. The windows, necessarily at a great height from the floor, to clear the stalls, also give colour, but of a more accustomed sort. Each, with the exception of the small west window and the central one of the eastern apse, are double-light windows, heavily traciced at the top. The square west end has one small window, with very deep embrasures obtained by setting it in an exceedingly fine oriel, just to be seen in our view of the exterior. The hexagonal apse has three windows, and the south side three and the north only one—by a happy inspiration which chose to fill the two western bays with coloured panels in relief, and so avoid a disreputable conflict of cross light, and induce a sense of attachment to the larger structure of St. Giles on that side. Each double window carries in clear coloured glass (or the decorative relief mentioned above) the names and arms of two of the knights. The list, reading round the chapel from the north-west bay, showing: Argyll and Montrose, Crawford and Tweeddale, Zetland and Errol; in the apse, Aberdeen and Hamilton of Dalzell, Roxburgh, and Haddington; on

the south side, Balfour of Burleigh and Home Rosebery and Fife, Buccleuch and Atholl. The badge of the thistle is emblazoned on each window, and across it, on a scroll, is the name of the knight. The one-light eastern window is dedicated to St. Andrew. The west window, in a colour scheme of gold and brown, carries the Royal arms, according to the Scottish quartering, and underneath those of the Prince of Wales and the Duke of Connaught.

The roof is founded on late XVth century examples, which time is by many people considered to be the zenith of the Gothic style, as the roofs of that period read as real constructive builder's stonework, which cannot be said of the fan tracery type of vault which came later. The aim has been to keep the stonework strong and vigorous, partly because the Scottish Gothic never attained the exquisite refinement seen in some English examples, and also because modern work is often too timid in scale as compared with old. As regards the bosses, the main bosses at the apex of the chapel roof represent, reading from west to east (that is to say, from left to right on our photograph), the Royal Arms, St. Giles, St. Andrew, the Jewel of the Order of the Thistle, and the large boss at the intersection of the apsidal end of the chapel, the "Pelican in her Piety." The bosses that are not heraldic are treated with some definite motive from Nature in the manner noted above concerning the canopies. The ante-chapel is 25 ft. in length by 14 ft. It is vaulted in two bays, and, like that of the chapel proper, its vault may be described as groined vaults, richly ribbed, having main ribs, transverse, tierceron, and lierne ribs,

The Chapel of the Thistle, Edinburgh. The Vault.
Mr. R. S. Torimer, A.R.S.A., Architect.

with carved bosses at all the intersections. As the ante-chapel vault had to be kept low (affording striking contrast with the chapel proper beyond), it is a four-centred vault founded on examples of a slightly later period than the vaults of the chapel itself. The bosses are coloured in the same way as those in the chapel. In the archways opening into the cathedral are some beautiful wrought-iron screens. The bays of the ante-chapel have cusped arches with carved terminals to the cusps, and in the soffit of the arch electric bulbs are concealed, showing the work most excellently, but with slightly theatrical effect. On the right side of the chapel door is a stone panel containing the arms of the donor and the following inscription: "This chapel was gifted by John David Earl of Leven and Melville and his brothers in fulfilment of the wishes of their father, St. Andrew's Day, 1910."

LIVERPOOL UNIVERSITY.

THE annual exhibition of students' work of the Liverpool School of Architecture was held at Liberty-buildings on July 6, 7, and 8. As before, the exhibition consisted chiefly of the work of those students who have completed the normal course at the School, each of whom has a bay allotted to him, in which he can arrange his own drawings as he pleases; besides this main body of work there are some selections of first-year work by students who will take the examination next summer, and also some examples of the work of past students. These latter contain several drawings made by Mr. Prestwich, a former student, who is now studying at the British School at Rome; there is a charming sepia drawing of the Porta Palio at Verona, a detail interior of the Pantheon in colour,

and a vivid water-colour sketch of the Temple of Neptune at Paestum. We understand that Mr. Prestwich is engaged upon, as his chief undertaking at Rome, the restoration of a palace at Palestrina, and as the ruins leave a good deal to conjecture we may hope for some imaginative piece of restoration such as the French students of the Villa Medici have frequently given us. We look forward to the day when, in place of this exceptional

case of Mr. Prestwich, this Roman sojourn will be the normal conclusion of the studies of our most brilliant young architects.

To return to this exhibition, the work this year appears to be well up to the high standard which we expect from the Liverpool School; the number of students turned on is actually small—six certificate students and one student for the degree course of Bachelor of Architecture, the second examination for

Interior of Hill Hall, near Epping.

Visited by the Architectural Association on July 8 (see last issue, page 38).

which he takes before leaving the school studio for two years in an architect's office. Numbers, however, in architectural, as in every other training, are not the first importance, and we had far sooner see the high standard of this little company of seven join the profession than a round score of rough recruits, who could bring brute force but no fine strategy to the cause.

The Holt Travelling Scholarship of 50l. has been awarded this year to Mr. H. C. Mason. The prize is given on two counts—measured drawings and design—and we feel that it has been well bestowed. In design, perhaps, Mr. Mason does not shine much brighter than several others, but his set of measured drawings of Blenheim Palace are considerably the most striking thing in the exhibition. Four huge drawings, beautifully rendered in tone, give a fitting representation of this colossal mass of sheer monumental architecture; so far as we are aware, there is not in existence an accurate set of drawings of Blenheim, and these drawings therefore constitute a valuable contribution to the study of English Renaissance architecture. The other measured drawings which were of particular interest were shown by Mr. Chambers, the student who is taking his degree of B.Arch.; Gabriel's Ecole Militaire and Duc's interesting and refined façade to the Palais du Justice at Paris were both admirably rendered. Otherwise, the measured work at this exhibition was hardly equal to the usual standard in point of interest. We noticed two sets of the small but striking front of the Liverpool Apothecaries' Hall; Trinity College, Dublin, we feel, was dealt with rather more fully than merits.

The series of "classical compositions" or studies in the grouping and arrangement of classical architecture—generally taken from some well-known example—are continued this year, and we should much like to see these reproduced in colour. The greatest possible amount of variety is shown, from a severe treatment of the north portico of the Erechneum framed within the enriched doorway to quite imaginary scenes covered with a wealth of Greek and Roman detail, like the work of a refined and Grecianised Piranesi. We noted studies of the Propylæa, the heroic monument of Lysicrates, the Erechneum, the Parthenon, the Temple of Vesta at Tivoli, and the Nike Apteros.

Turning to the designs, we feel that, though perhaps there is not any single student as brilliant as was Mr. Prestwich last year, the general average is higher. The subjects of several of the designs are evidently suggested by Liverpool's locality; the new skyscraper on the Mersey front has given the idea for a vast office block, and the amazing vitality of the present pier-head erections has led to an attempt to design something

St. John's Church, Epping. The late Mr. G. F. Bodley, R.A., Architect.

Visited by the Architectural Association on July 8 (see last issue, page 36).

more worthy the second town in the kingdom, at the same time including a monument. We illustrate Mr. Mason's version of the latter, and Mr. Davies' skyscraper. Mr. Thompson's tram shelter for a public place is a simple, strong design which suggests possibilities of treatment undreamt of by our corporations.

Mr. Chambers's examination design (for which he was allowed one month) was a cotton exchange, and we illustrate a portion of the plan in detail. Other designs were for a mausoleum and for a monument to a naval hero in a similar position to the Wellington Monument under the arcade of St. Paul's. Three or

Liverpool University: School of Architecture.

four, at any rate, of these latter designs were of great merit, and lead one to hope that the future of our public monuments may not be so disastrous as the past has been.

Domestic architecture is represented in a very practical way by a design for a row of seven cottages to be erected at Port Sunlight. Mr. Lever offered three prizes of 25*l.*, 10*l.*, and 5*l.*, for the best designs submitted, which were awarded to Mr. R. F. Dodd, Mr. W. E. Davies, and Mr. A. R. Sykes. We consider the School is exceedingly lucky in having such practical and stimulating prizes offered to them. Mr. Lever also gave an additional prize of 25*l.*, which was awarded to Mr. Davies for the purposes of travelling study.

We understand that the Liverpool School of Architecture sketchbook will be published again this year, which will contain the drawings shown at this exhibition reproduced to a large scale.

PRECIOUS METAL-WORK.

It is a fact worth noting that artistic work in the precious metals is at a lower ebb to-day than it ever reached in any past period of British craftsmanship. The big manufacturers have not been influenced at all by that revival of handicraft and design which Pugin began and William Morris developed, with help from many men of distinction; and it is a very small public that encourages the beautiful skill of Alexander Fisher, of Nelson Dawson, of Harold Stabler, and of other metal-workers who are genuine artists. We cannot justly complain of the flaunting trade products, because manufacturers have to appeal to the ruling tastes of the hour; and we know that our British public will accept anything if it be shown in a splendid shop and advertised profusely in newspapers. Common-sense appears to grow less with each advance in free education. When the training of the English people meant an apprenticeship in many handicrafts, the difference between good work and bad was a matter of taste that most people could be trusted to see for themselves; while the general aim to-day is to buy something that is showy and "cheap." Its cost of production must be very low, for those who purchase it like to see it advertised in the most expensive newspapers, at the rate of 350*l.* for a full-page announcement. This expense is added to the other costs of production, yet the eager faith of the million believes in "cheapness" as a

blessing. How long this sort of trickery will last no one knows; but it is high time that our free schools made efforts to infuse a little common sense into their teaching.

Some years ago the *Studio Magazine* tried to awaken public interest in metal-work, issuing a series of articles that appealed to sportsmen. The usual sporting cup is a thing of horror, bad in form, and with a surface as smooth as ice. There is never a trace of a tool-mark; and if you tell the manufacturer that beauty is skin deep, and that precious metal-work owes its charm to a living surface treatment, he shrugs his shoulders and says that people buy his goods. The man is right. Sportsmen do not care a row of pins for any quality except the negative one of size. Their cups must be cheap and big. On that point they are all agreed; and for this reason, among others, the articles in the *Studio* had little influence, though they gave new designs by excellent artists.

It is pretty much the same in another phase of national metal-work, the plate and the table-centres used by Army officers at their mess. These are usually supplied by some large shop; it is not often that a commission is given to a craftsman. But we illustrate herewith an exception to this rule, showing a table-centre in silver and enamel designed and executed by Mr. Harold Stabler for the Welsh Regiment. The height is rather more than 2 ft. 10 in. The lower part is a silver bowl for fruit, surrounded by pillars; these are ornamented with a chevron design in green and white cloisonné, and their capitals of rich open-work have tops of green enamel, surmounted by the heraldic Welsh dragon. The knob is embellished with alternating panels, some with Prince of Wales's Feathers, others with openwork vine ornament. Above, supported by brackets, is a graceful dish for flowers, with goats rampant standing on the rim, for the Welsh Regiment has long been famous for its white goat. From the centre of this flower-dish rises an enamelled shaft decorated with chevron pattern. It leads up to a ball of silver, on which stands a female figure playing a harp, an emblem of Wales.

In addition to this table-centre, other recent examples of Mr. Stabler's craftsmanship include an altar cross in brass, a silver chalice 6½ in. high, and another silver chalice enriched with Ceylon stones. There is no need for us to praise their handling, because their beauty is quite evident; but why should not a chalice be made with a cover? A communion-cup is a sacred thing, and ought to be protected from the

Silver Bowl: "The Seasons."

By Miss Florence H. Steele.

desecration of dust. In the old days it was customary to cover the chalice with the paten, but there is reason to believe that prelates were not always satisfied with this usage, for in Bishop Montagu's "Articles of Inquiry," dated 1638, we find the following question:—"Have you a chalice or communion-cup, with a cover of silver, and a flagon of silver or pewter (but rather of silver) to put the wine in?" Had the cover in this case been the paten, or communion plate, surely the Bishop would have said so.

Miss Florence Steele's work is always a feature of the Arts and Crafts Exhibition held triennially; the silver bowl above is a representative example of her craftsmanship.

GENERAL NEWS.

Professional Announcement.

The staff of Sir Aston Webb, R.A., and Maurice E. Webb, M.A., will be on holiday from July 22 to August 7, and during that period the firm will be obliged if urgent matters only are brought forward.

Reading Abbey.

Dr. Jamieson B. Hurry has presented to the borough two memorials of Hugh de Boves and Hugh Cook de Faringdon—first and last abbots of the Abbey. Each memorial is carved out of a slab of blue Forest of Dean stone, 6 ft. by 5½ ft., with scenes, in bas-relief, from the abbots' lives. The stones have been deposited by the site of the abbot's chair in the Chapter House.

London University Holiday Course.

During the second week, beginning July 24, Mr. Allen Walker will lecture upon "Historic London," and Professor Walter Rippmann upon "The School of John Lyon at Harrow-on-the-Hill." The programme includes an excursion to St. Albans on July 27, and on July 29 visit to Hampton Court Palace under the guidance of Mr. Allen Walker, who will there deliver a first lecture upon "Tudor London." The course will conclude on August 11; seven-teen nationalities are represented.

University of London School of Architecture: Course in Academic Design.

A day course in academic design will begin in October, 1911, at University College. The course will be conducted mainly on the lines of the course in the Ecole des Beaux-Arts, Paris. Dr. J. J. Burnet, A.R.S.A., F.R.I.B.A., has consented to act as architect-visitor, and criticise the designs submitted from time to time as may be necessary. The course is not intended for beginners, but for those who have already attended a course of recognised training at a university (or other institution), or have otherwise obtained their preliminary education. The need for such an advanced course has long been manifest. A large number of students, after their pupillage stage is passed and after they have spent some time in an architect's office, are often at a loss to know what to do next. Few are able to start practice on their own account with sufficient work to keep them fully employed, and yet have enough to do to make it difficult for them to continue as assistants. Many also have had no opportunity of working out problems for themselves on a large scale, or seeing such problems solved in offices in which they have worked. There will be no definite entrance examinations. All students will be eligible who can produce drawings to show that (1) they have a thorough acquaintance with the "Orders," perspective, and topography; (2) that they can express this in good drawing; (3) that they have passed through a course on construction; (4) that they have a fair knowledge of design. This course of academic design is additional to the two day courses which are arranged to lead up to the academic course. Further information can be obtained from Professor F. M. Simpson, F.R.I.B.A., University College, London, Gower-street, W.C.

Royal Visit to Edinburgh: Holyrood Palace and St. Giles's Cathedral, Edinburgh.

For the residence of the King and Queen at Edinburgh during the current week a rearrangement has been made of the state-rooms in Holyrood Palace. Under the directions and superintendence of Sir Schomberg McDonnell, Secretary to the Office of Works, and Mr. W. T. Oldrieve, F.R.I.B.A., the suite of rooms, known as "Queen Victoria's apartments," in the east block have been fitted for occupation, and on their walls have been rehung the old pieces of Flemish tapestry which were removed about sixty years ago. In the State drawing-room the floor is raised, and new panelling is fixed, of oak from a single tree grown at Yester, Lord Tweeddale's seat; the walls of the grand staircase are restored to their former state by the stripping off of disfiguring paint. The chapel of the Order of the Thistle, St. Giles's Cathedral, dedicated by the King, has been erected at the south-east corner of the Cathedral, after the plans and designs of Mr. R. S. Lorimer, A.R.S.A., F.R.I.B.A., Mr. Thomas

Ross, F.S.A. (Scotland), acting as honorary consulting architect to the trustees. The building measures 33 ft. by 19 ft., and is 35 ft. high to the apex of the vaulting. There are special stalls for the Sovereign, the Prince of Wales, and the Duke of Connaught, and, round the side walls, sixteen for the Knights of the Order. The fabric is of Cullaloe stone; of the stained-glass windows, that in the apse is by Mr. Douglas Strachan, the others are by Mr. Louis Davis; Mr. Hayes executed the stone carving, and Messrs. Clow the carved oak panels and stalls; the stall plates, of enamel, are by Mrs. Traquair, the wrought-iron gates by Mr. J. Hadden.

University of London, University College: Heating and Ventilating Engineering.

The course of heating and ventilating engineering at University College is intended for students having a sound elementary knowledge of mathematical science, and intending to specialise in the practice of heating and ventilation. The course includes:—Z 1. Preliminary public course of lectures on "The Real Nature of the Problems in Heating and Ventilation Awaiting Solution by the Engineer." Z 2. Course of lectures on the detail of the subject. This course comprises discussion of the application to the problems of heating and ventilation of the principles of science, and includes such subjects as the following:—Properties of air, water, and steam; theory of heat, conduction, radiation, convection; theory of flow of fluids, air, water, steam; transmission of heat through walls, windows, doors, roofs, etc.; emission of heat by radiators and pipes under different conditions; combustion of fuels, quantities of air, and temperatures attained under different conditions; boilers and chimneys—the principles of design, construction, and economy; distribution of heat, principles of water circulation, high pressure hot water, principles of steam circulation; application of the theory of the flow of water and steam in pipes to the determination of pipe sizes, (a) natural circulation, (b) forced circulation; descriptions of the various systems of forced circulation and the calculations for them; heating by warm air, stoves, fireplaces, gas, and electricity. Z 3. A course of laboratory instruction, illustrative of the above subjects (Z 2). Experimental research for those students competent to undertake original work under the direction of the lecturer will continue throughout the session. At the end of the second term, a tour in Germany will be arranged to inspect important installations there. The tour will be under the guidance of the lecturer, Mr. Arthur H. Barker, B.A., B.Sc., to whom application for further particulars should be made.

Commercial Failures.

According to *Kemp's Mercantile Gazette*, the total number of commercial failures recorded in England and Wales during the week ending Friday, July 14, was 133. The failures recorded during the past week included the following trades, and for comparison we give the number in each in the corresponding weeks in 1910 and 1909:—

	1911.	1910.	1909.
Building and timber trades	21	23	12
Hardware and metal trades	2	7	5
Iron and steel trades	4	3	—

National Town Planning and Housing Association.

Mr. H. R. Aldridge, Secretary of the Association, has organised the arrangements of a visit to England of sixty representatives of municipalities of nine European countries—Austria, Belgium, Denmark, France, Germany, Holland, Italy, Norway, and Sweden. The party arrived in the course of this week, and will visit the Hampstead Garden Suburb, the Housing Exhibition at Gidea Park, Romford; Bourneville, the Rowntree model village at Earswick, Woodlands Village near Doncaster, the garden suburb at Hull, and other places.

William Penn Memorial.

The memorial tablet which the Pennsylvania Society of New York have just erected in the Church of All Hallows Barking, by-the-Tower, is executed in bronze after a design by Messrs. McKim, Mead, & White, of New York. Penn, who was born in his father's house on Tower hill, was baptised in the church on October 23, 1644.

"FELDENHURST," BOXMOOR, HERTS.

The residence of Mr. Herbert Smith, B.A., is erected upon a 2-acre site, sloping towards the west and facing the nine-hole golf links of Shothanger Common. The site is 500 ft. above sea level, with extensive views in the direction of Ashridge Park, preference being given to view rather than aspect; the principal rooms face west. The drawing-room has also a south and east view. A feature in the planning of the kitchen quarters is a baker's brick oven, adapted to modern use from the old mediæval type.

Both the house and stable were originally contracted for, circumstances, however, necessitating the completion by day-work under the architect's supervision. The principal sub-contractors were Messrs. Martyn & Co., of Cheltenham, oak chimney pieces; Messrs. J. P. White & Co., of Bedford,

"Feldenhurst," Boxmoor, Herts.
Mr. A. F. Bullock, A.R.S.A., Architect.

entrance gates; Mr. G. Jaggard, of Bushey, for joinery and staircases; Mr. Woodley, Hemel Hempstead, for sundial, stone, and marble work, and Messrs. Martin Van Straaten for tiles. The Standard Range Company, Ltd., provided the Burkone fires and specially cast the interior grate to dining-room, together with the patent casement fasteners, both latter designed by the architect.

The walls are 2-in. Ellistown red facing-bricks, with hollow filled with Hygienic rock composition, exposure to continuous north-east and south-west driving rains requiring careful construction. The oriel window on first floor is the owner's study, and from the flat above an extensive view is obtainable and fine sunsets are to be seen. Both hanging and roof tiles are local Bedfordshire.

The architect is Mr. Albert E. Bullock, A.R.I.B.A.

BOOKS.

The County Churches of Cambridgeshire and the Isle of Ely. By C. H. EVELYN-WHITE, F.S.A. (London: G. Allen & Co. 2s. 6d.)

We have already reviewed the earlier of the volumes of this series, and feel sure that this one will reach a still larger public, since it will appeal not only to the ordinary resident and visitor to this district, but also to Cambridge 'Varsity men, past and present. The illustrations (24 in number) are good and well chosen. The arrangement of the churches in alphabetical order is convenient, and the amount of information crowded into the limited space is extraordinary. The author seems to have noticed everything of interest in the different churches he has visited. Nevertheless, his anxiety to do this has caused his style to resemble notes rather than a narrative. This has a rather unpleasing effect. We think it was a mistake to include references to modern churches except when these simply replaced old ones. The view of the Allington Monument (Jacobean) at Horeheath is very pleasing, and in this, as in several other cases, the author has given us a happy variation from the usual type of selection. These are often merely exteriors taken from some distance, and therefore of little value archaeologically.

We regret that there are no brasses illustrated. The brass-rubbing fraternity is very strong at Cambridge, and Conybeare's Guide is largely purchased simply because of the useful list of Cambridgeshire brasses with illustrations, which it has as an appendix. Since in none of the volumes has a single illustration of these occurred, we cannot help wondering whether the publishers think them

not desirable. If so, we consider it a pity, as they are of the greatest value for showing the dress of the period. The author's severe condemnation of ruthless restoration, supporting, as it does, the opinions of the previous writers in this series, cannot fail in time to affect a great alteration in the minds of those who have charge of our ancient parish churches.

Is it too much to ask that every vicar should purchase the volume in which his

church is described. If this were done, we should soon cease to hear of old churches destroyed or "restored" out of existence.

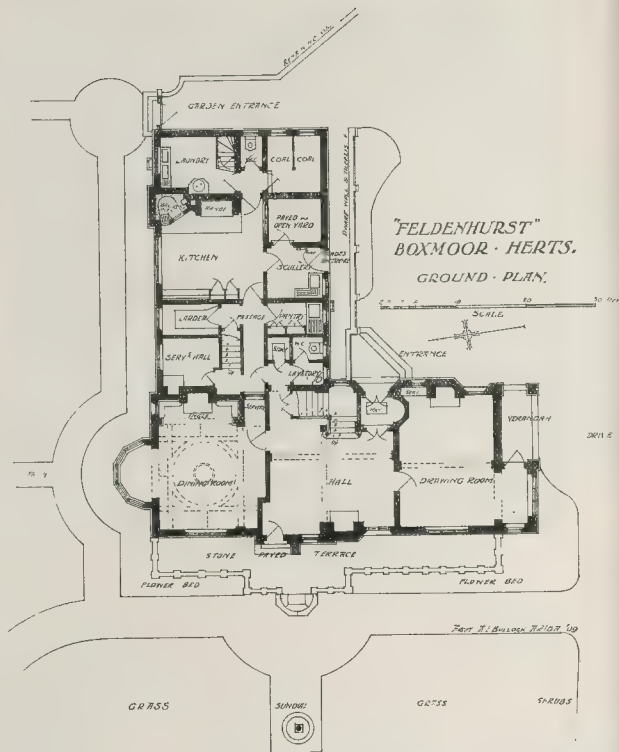

The Architectural History of Glasgow Cathedral. By T. L. WATSON, F.R.I.B.A. (J. Hedderwick & Sons, Glasgow.)

In a slim pamphlet of thirty-one pages Mr. Watson gives the "Autobiography of a Cathedral," or, in other words, he makes the building itself yield the history of its growth, which is unrecorded in any written documents. There may be some room for differences of opinion in regard to the very detailed conclusions, which he reaches from an examination of the existing building, but there can be little doubt as to the soundness of his general results.

Only a portion of "St. Mungo's work" forms the subject of this monograph, namely, the choir erected during the episcopates of Walter, Bondington, and Wishart, and the prosperous reigns of Alexander II. and III., for though the nave was carried on "somehow during the XIVth century—then the towers and adjuncts"—amid bloodshed and strife, "the autobiography is clear and legible only so long as the workers kept line and step with their English brethren; so long, that is, as we have the firm and broad basis of English and European archaeology to found upon. From the end of the XIIIth century the regular and consistent development of the architecture of the Cathedral ceases."

In the period defined the author, taking the mouldings of the vaulting ribs as a clue, a method which he makes very clear by means of admirable coloured diagrams, distinguishes five stages of building, which he sums up thus:—

"Begun by Bishop Walter, just 700 years ago, we have seen his temporary chapel completed about 1220. Continued by Bondington, the walls and pillars of the lower church, with the aisle vaulting and, as we believe, one bay of the middle vault, were finished about 1240. Ten years later the upper aisles were reached, the north aisle first, the eastern vault next, and the south aisle last. By 1260

"Feldenhurst," Boxmoor, Herts.

Mr. A. E. Bullock, A.R.I.B.A., Architect.

the whole main structure of the choir was completed, and the builders returned to the unfinished lower vault. By 1270, or soon after, the lower east vault and the transept stair vaults were finished, and the wide openings left at each end of the eastern aisle and in the east wall became graceful lancet windows. By 1280 the choir was unfinished."

In the course of his searching analysis Mr. Watson throws interesting side lights on the methods of the mediæval builders. He explains the order of the construction by the exigencies of the building works. For instance, the vaulting of the middle compartment of the choir crypt was, he believes, delayed till the upper aisle vaults and the clearstory were finished in order to permit of the hoisting of the building material direct from the floor. Other points in the curious changes introduced into the design at various stages as it proceeded are explained by the progress in the science of vaulting between the time certain piers were built with their springers and the moment when their vaults were added; others, again, by variations in ritual. For fuller detail the reader is referred to Mr. Watson's most suggestive study.

Highways and Byways in Cambridge and Ely. By the Rev. EDWARD CONYEBARE. With Illustrations by FREDERICK I. GRIGGS. (London: Macmillan & Co. Ltd. 6s.)

THE chief object of the author of this admirable little book has been to introduce his readers "to the unique interest" of Cambridge and Ely, "with special regard to the points most closely passed over in guide-books," and a perusal of the work affords ample evidence of the successful attainment of this object. A considerable part of the volume is devoted to Cambridge and its colleges, the author writing pleasantly and with discriminating enthusiasm of the architectural and other features of the town. In the same spirit he writes of Ely, as well as the villages, hamlets, and "byways" mentioned in the volume, the work forming an excellent, handy, and reliable guide of special, though not exclusive, interest to architectural and archaeological readers. It is sufficient to say of the drawings by Mr. Griggs that they charmingly illustrate some of the buildings and places described, and materially assist in enhancing the value of an admirable work.

Architektonische Handzeichnungen alter Meister. Herausgegeben von Architekt Dr. Hermann Egger. (Verlag für Architektur und Kunstgewerbe Friedr. Wörlum & Co. Vienna and Leipzig. 100 marks.)

EVERYONE who has gone through this portfolio of drawings must confess himself greatly indebted to Professor Egger and to his publisher. For, various as the selection may be, there is not a single drawing which fails to interest, and they are all most excellently reproduced to a large scale and appropriately mounted on a blue-grey paper. As reproductions of old drawings we know of none in which it has been sought more carefully to preserve the spirit and tone of the originals. The majority of the drawings are preserved in the Royal Library at Vienna, and the others are taken from other collections, public and private, of the same city. In the provisional portfolio before us (the first volume will consist of sixty plates) there is no attempt at chronological classification or arrangement of subjects. The artists are of all countries, the period covers any date from the beginning of the XVth century to the beginning of the XIXth, and the examples comprise anything from the apse of a Gothic church to the lay-out of the park at Schönbrunn. But the unity of the collection is preserved by the merit which distinguishes every plate, as well as by the fact they all in some sort express an architectural idea. The draughtsmanship, as a whole, is remarkable; it is, nearly always, sufficiently precise for an architectural drawing, while possessing a freedom and individuality which give each plate an independent artistic character. How many of these designs have been carried into effect we have not the time to investigate; the editor will no doubt clear up this point in the text which is to follow. The authorship of the designs is in some cases unknown, and the drawings are attributed to various Continental schools. Among those which are definitely attributed are Bernardino Poccetti's (1542-1612) design for a window decoration;

Martino Lugini's (second half of the XVth century) for the façade of a church; a sketch for the ceiling of a church by Alberti; a series of sketches on one plate by Bernini of the upper portion of his well-known Baldachino at St Peter's; two interesting drawings of churches at Rome, by Girolamo Rainaldi (1570-1655) of a more complete architectural interest than many of the other drawings; two examples of Bibiena's brilliant rococo designs for stage scenery; a fountain at St. Cloud, by Le Blond; a perspective view of a ballroom designed by Jean François Chalgrin on the occasion of Louis XVth's marriage with Marie Antoinette; a fine imaginative conception, in monumental classic, by Hubert Robert (1733-1808) (which we illustrate); and finally we have two examples of the work of the Viennese architect, Hetzendorf von Hohenberg, both of which have been carried into execution.

There is no need, therefore, to dwell upon the historic interest of this collection: so far as architecture and architectural decoration is concerned, it covers many styles, and in some instances it touches perhaps rather style in the making than in the more complete expression which our architectural writers and guides have taught us to accept. But we may believe that the value of the collection is not merely antiquarian. It is, indeed, living and present. These great designers of the past exist before us again in these drawings; they are articulate, and their voices

bridge time, and whether we approve altogether of their work or not, from the point of view of individual taste or prejudice, is a small matter compared with this communication of spirit with the choice assemblage which Professor Egger has brought together, and which speak to us, not in the terms of history, but of living men, who sought to express themselves in the artistic vocabulary which we call design.

Stories of the Spanish Artists until Goya

By SIR WILLIAM SPURLING-MAXWELL. Selected and arranged by LUIS CARREÑO. With introduction by EDWARD HUTTON. Pp. 309. Thirty-two illustrations (eight in colour). (London: Chatto & Windus. 1910. 7s. 6d. net.)

"ARTISTS," in this case, as too often, means painters only, or those artists who, though they may have done work in other directions in the spacious fashion of the Renaissance, were yet known chiefly for their pictures. Which is a pity, especially in dealing with the art of Spain. Spain is, or was, not a land of great painting. It is in her sculpture, which, though never fine, is plentiful and powerful, romantic and yet realistic, even in decline grandiose and "large," and in her architecture that old Spain is chiefly glorious. There should have been no great difficulty for the purposes of a book such as this, which seeks only to present the main incident in each life, in noticing the others. Spain has

Sketch for a Ceiling Decoration. By Giovanni Alberti (1558-1601).
(From *Architektonische Handzeichnungen alter Meister*.)

not lacked her Vasari, whether you consider him to be best represented by the diligent Pacheco, a contemporary of the Italian's later years, or by the equally diligent and more advantageously timed Ceán Benúndez (an account of whose life is included in this book), who died in 1829. But perhaps we find fault with the authors (to what extent each was author is not made clear) because their book is not what it was never intended to be. It is because we feel bound to deplore wherever we meet it the limitation of the meaning of "artist" to those who are concerned only with graphic delineation and the painter's craft.

These short biographies give the principal facts and a fair sprinkling of anecdote of the lives of some fifteen painters, beginning with Morales, somewhat in the manner of Vasari, though lacking the charm of Vasari's more intimate narrative, even as given in the "Stories from Vasari," a companion volume to the present one, issued a year or two ago. Critical pronouncements are interspersed, which are not of such quality as to warrant Mr. Hutton's assertion in an otherwise first-rate preface that "this little volume makes a first-rate introduction to the Spanish school of painting." Besides, as we will point out later, it does not begin at the beginning and continues one step further than the end. A much better introduction really and of much greater interest also to those who know anything of Spanish work and of Spain, and of much greater value, is Mr. Hutton's own critical preface to this book. His case against the Church—that Church which made Spain, without which Spain would not have been in existence at all, in its own image, and then bound her rigorously lest she should depart from that way—is clear, and has the large historical sweep.

The regard in which Spanish art has for a long time—from perhaps before the influx of spoil from the Peninsular War—been held in this country has given rise to a conception of Spain as a land of art, analogous, though secondary, to Italy. This is a misconception. With the exception of a few outstanding personalities the race has betrayed, or, according to Mr. Hutton, has not been permitted to display, much of the gentler sympathy and desire of beauty for itself which are the chief ingredients in what we call artistic sensibility. In the classification "northern" and "southern," into which anything almost, and certainly any country can be put, the greater part of Spain comes under that of the north. In the Spanish character there is a hardness, a preoccupation with actuality, and the material aspect of things, even of spiritual things (again, according to Mr. Hutton, due to the coercion of the Church), which consents explicitly with the distinct outlines and often even garish colouring of the land itself. The phrase of the tourist advertisement, "Sunny Spain," though literally accurate and attractively alliterative, is yet wrong if it conveys an idea of a people careless and lightly emotional. Emotional, certainly, but with a seriousness, a moral intent, and dramatic intensity which the term southern is not easily made to fit. And so we find to begin with—although there was a great Iberian art it has little to do with this story—before Morales it is a cutting from the Flemish plant, rendered accessible by political circumstance, with its flower of serious feeling in leaves of meticulous veracity, which grows so vigorously as the art of Spain. Flemish art was widely appreciated, and widely practised by many whose names are not preserved, and it reached some height in the hands of Dalmau, for instance, and Alejo Fernandez, of Cordova—both serious omissions from the volume before us.

Then comes the wave from Italy, a little "late," swamping the Flemish growth which was altering Spanish nationality, and by its premature liberation of brushes which could not use without licentiousness the freedom conferred, did infinite harm. Gradually the serious uncompromising spirit of Spain again asserted itself. In Morales, the monk who seems to have been destined first to uphold it, under the patronage of Sta Teresa herself, so devoid of adventitious circumstance to persuade him, does his environment seem to have been. We find it in Il Greco, errant Venetian, and, always excepting Velasquez, the nearest approach to an artist *sans arrière pensée* which Spain can boast. In Ribera

also, *il Spagnoletto* of Naples, as powerful an invader of Southern Italy as the Spanish King himself, and better remembered; a scoundrel, artistically quick from Hades *vid* the Garden of Gethsemane, and the greatest painter which Spanish culture of Spain produced. We say this advisedly, because Velasquez, although his earlier work—one or two examples of which were to be seen at the Grafton Gallery a year or two ago—shows the influence of Ribera, cannot be said in any way to have been produced. He was a miracle, which might more properly have happened some years ago in France, or in England to-day. Of Zurbaran, Lord Leighton said that he was the "completest representative in art of the genius of his race," and with him, despite Mr. Hutton's disparagement, we hold. With his judgment on Murillo, which is the current one of distaste and contempt, introduced by a disarming avowal of complete lack of sympathy, we need not disagree. It is an artist who, when the present reaction against the facile admiration of the multi-centuries has spent itself, will be given his "place in art" and there let lie. Concerning Goya, whose life is, not very logically, included in this book, Mr. Hutton says nothing at all. And rightly, for Goya initiates modern art; initiates, too, the freedom of art in Spain—that freedom which has enabled Zuloaga, Corredora, and de Zubiaurre to give earnest of the persistence of Iberia in the race.

CORRESPONDENCE.

St. Paul's Bridge.

SIR.—The three strong points alleged against the bridge being in axis with St. Paul's Cathedral and in favour of the City's proposals are—First, the traffic; second, the danger to the Cathedral by making the tramway subway; and third, that a skew bridge will necessarily have to be in steel.

Regarding the first, you, sir, have proved that the true traffic line is not as provided for in the official scheme. So far as the second is concerned, we venture to express the opinion that modern architectural skill could overcome the difficulty, and we base such opinion on our own experience in connexion with the old Admiralty building. When the proposals were before Parliament to erect Blocks 1 and 2 of the extensions, certain critics sent a round robin to the Members of the House of Commons stating that the stability of the old building would be endangered, but the then First Commissioner, by the advice of Sir John Taylor, K.C.B., and ourselves, traversed such statement, with the result that we not only underpinned the walls next Block 2, but subsequently took down the walls adjoining Block 3 to over 30 ft. below the surface and into the London clay with perfect success. Perhaps the third objection requires little comment in these days of reinforced construction.

LEEMING & LEEMING.

Gidea Park.

SIR.—The extremely unsatisfactory nature of this competition is daily becoming more obvious, and it is surely time that the Institute made some pronouncement upon the desirability or otherwise of architects entering into competitions which involve actual building as well as paper designs.

In this case competitive houses to the value of 60,000*l.* (approximately) were erected by architects on "spec," and in many cases have been financed by them on ground rented or bought from the company who instituted the competition.

The capitalised value of the ground rents created amounts to about 20,000*l.*

When the buildings were erected they were thrown open to the public as an exhibition, the company charging the architect competitors 5*s.* per house per week for opening them in the morning and shutting them at night, and 4*s.* per week for watering the gardens, the cost of the water excluded. This means that the competitors are paying the company at the rate of over 3,000*l.* per annum for these trifling services.

On February 22 the company wrote to each competitor offering to act as agents for the

sale of the houses, and to place at their disposal an expert staff for this purpose, and, needless to say, for a handsome consideration.

The climax was, however, reached when the following letter was received by the competitors:—

"July 12, 1911.
DEAR SIR,—At a meeting of the Directors of Gidea Park, Ltd., at this office to-day, I was instructed to write and draw your attention to the opportunities now afforded by the hundreds of visitors to the estate, of which many builders are not at present availing themselves. It is impossible for the staff of the estate office to act as guides to more than a very small percentage of the visitors, and those builders who have no representatives to show their own houses (especially on Saturdays) are, in our judgment, missing a great opportunity of doing business.

One exhibitor alone on the estate has, by keeping a representative in his exhibition house, already obtained orders for twenty-nine repeats of the house on this estate and elsewhere.

We therefore urge upon you the desirability in your own interests of arranging for some personal attendance at your exhibition house.

Yours faithfully,

(Signed) R. DE JERSEY,

'Sales Manager.'

The exhibitor who has already sold twenty-nine houses is to be congratulated on the results of his speculation. Personally, I hope he will sell another twenty-nine, but is it really advisable for architects to become speculating builders in addition to their already multifarious activities? The use of the word "builder" in place of "architect" in the foregoing letter is significant.

The company have, no doubt, done extremely well, and must be laughing up their sleeves at the 140 odd architects who bought their land and built up their estate for the paltry consideration of 1,050*l.* in prize money, and the promise to buy a few of the houses. Could not the assessors get better terms than these? There are various other curious and novel points in the conduct of this competition which ought to be investigated, but which it would take too long to set out here.

I am not a competitor or interested financially or otherwise, except by the extraordinary apathy of the powers that be in not inquiring more closely into the conditions and probable effects of such a revolutionary competition.

MATRICES E. WEBB.

Questions for Builders.

SIR.—With reference to the letter in the *Builder* of July 7, over the signature of "Builder's Manager," one cannot help admitting that building employers have much to contend with in their dealings with various bodies and individuals, though the London Master Builders' Association is constantly and earnestly endeavouring to remedy such evils as are brought to its notice, whether those evils result from thoughtless or tyrannical action on the part of the legislature, public bodies, building owners or workmen.

The Council of the Association meets frequently and deals with questions of difficulty or moment as they arise, but it cannot be denied that, in the face of all its strenuous efforts, many of the burdens the trade is called upon to sustain are thrust upon it not so much by the action of others as by the action of some builders who are not members, and who are ever ready to grasp at what may appear to be to their own personal advantage, utterly ignoring what is being done by the Association, and thus bringing severe penalties upon the trade generally by their want of unity.

Such firms are a standing danger to themselves and to their fellows. They open doors for the unscrupulous, encourage unreasonable requirements from architects, and breed disquietude among workmen. They take no part in bearing the cost of making such reasonable arrangements which are for the general good of all parties, nor do they attach to working rule agreements the importance they deserve. They exercise a free hand in all their dealings, and would be the first to cry out against the enforcement of such discipline as that to which workmen have to submit from their unions. When all employers adopt "unity" as their guide, an immediate remedy for many of the existing crying evils will be found.

The "Builder's Manager" refers to the practice of the City of Westminster with regard to its unreasonable demands for hoardings and retention money. These facts are well known and generally condemned. A

reputation from the Association waited upon the Committee of the Westminster City Council, and spoke very strongly against the practice, but without avail.

Let builders take the present condition of things to heart, and adopt the only step I can suggest that will lighten their burdens, viz., the strengthening of their Association and confidence in those at its head.

I may say in conclusion that the London Master Builders' Association includes practically all the prominent building firms in the Metropolis, and I would like to point out that the assistance of the firm of the "Builder's Manager" would be more appreciated if it would put its shoulder to the wheel and help to bring about that unity which the "Builder's Manager" evidently has in his mind, and which I think to be most desirable.

EXPERTO CREDE.

Shrinkage of Joinery in Hot Weather.

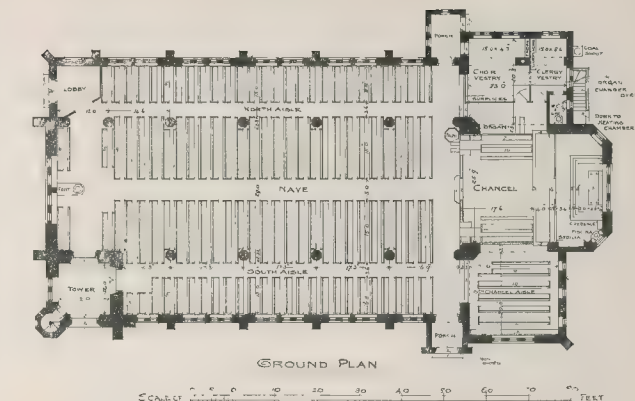

SIR,—I have no doubt most builders are being called upon to accomplish the impossible and manufacture joinery that will not shrink during this hot weather. A little experience of my own may therefore be of interest. Five years ago I built a motor shed, the doors of which were of ordinary yellow deal, framed and braced, and filled in with $\frac{3}{4}$ in. matchboards in narrow widths. These have stood airily well, there being no shrinkage to excite comment. They were repainted last Easter, and, of course, properly stopped. To my astonishment, just lately these boards have shrunk and the joints opened in one or two places sufficiently to expose the unpainted surface of the tongues. If this can happen after five years of seasoning, what possible chance is there, under modern rapid conditions of building, of being able to produce the unshrinkable joinery architects so keenly insist upon? I may mention that the doors face north-east, so that they do not experience the full strength of the sun's rays.

W. F. WALLIS.

INTERCOMMUNICATION COLUMN.

Artificial Drying of Timber.

SIR,—We shall be glad if any of your readers can give us any information with

New Church of St. Leonards, Bedford.

Mr. George P. Allen, Architect.

regard to the advantages or disadvantages of artificial drying timber, etc., also the best system.

Drainage of Premises.

SIR,—I should be glad of advice on the following matter. In connexion with the drainage of some premises in Poplar I am being called upon to connect with one of the main outfall sewers laid down by the old Metropolitan Board of Works. As this main outfall sewer is down a depth of 33 ft., the expense of such a connexion is very great, and I should be obliged if you will inform me what are my legal rights in such a case. A local authority having failed to provide an efficient and convenient drainage scheme for their area, can they compel a ratepayer to connect his drain with a main outfall sewer of a bigger authority?

J. E. BEAUMONT.

CHURCH OF ST. LEONARDS, BEDFORD.

THIS new church is to be erected in a newly built part of Bedford; the materials to be used are: The exterior of Crowborough blue bricks, with Weldon stone and red-brick dressings, and local tile roofs. The interior of bricks plastered, nave arcades of Weldon stone, floors of wood block, leaded-light windows. The church is to be heated with radiators, and lit with electric light. The plan shows a tower at the west end, nave, aisles, south chancel aisle, chancel, organ chamber, and vestries. The completed church to hold over 800 sittings, and to cost 7,000*l*. It is proposed to build half the nave, aisles, chancel, etc., for 3,800*l*, and to accommodate 500 sittings. Mr. George P. Allen, of Arundel-street, Strand, London, is the architect.

NEW CHURCH OF ST. LEONARDS
BEDFORD

EDITORIAL SUMMARY.

Our leading article deals with the Edward VII. Memorial, and points out the difficulties involved in the site now proposed.

Our second article is on the St. Paul's Bridge Bill, some points in regard to the evidence of the architects who appeared before the Select Committee being considered (p. 60).

Notes (p. 60) contain: "Ozone Water Sterilisation"; "The New Rooms at the National Gallery"; "The South Kensington Site"; "East London Memorial to King Edward"; "The Natural History and the New Science Museums."

"The London Salon" is the title of an article given on p. 61.

An illustrated article on "The Chapel of the Order of the Thistle, Edinburgh," will be found on p. 62.

An article on the annual exhibition of students' work of the Liverpool School of Architecture is given on p. 64.

An illustrated article on "Precious Metal-Work" will be found on p. 66.

Book Reviews (p. 68) include: "The County Churches of Cambridgeshire and the Isle of Ely"; "The Architectural History of Glasgow Cathedral"; "Highways and Byways in Cambridge and Ely"; "Stories of the Spanish Artists until Goya."

Correspondence (p. 70) includes: "Questions for Builders"; "Shrinkage of Joinery in Hot Weather"; "Gidea Park"; "St. Paul's Bridge."

The Monthly Historical Review (p. 73) includes: "Forgotten Architecture of the Far East" (illustrated); "Exhibitions at Rome"; "Ancient Monuments and Historic Buildings"; "Wallpaintings in Surrey Churches"; and Notes.

The Building Trade Section (p. 79) consists of: "The Clerk of Works"; "A London Carpenter Four Hundred Years Ago"; "United Builders' Alliance"; "Government Contracts"; "Projected New Buildings in the Provinces"; "Applications under the London Building Acts," etc.

In Legal Column (p. 83) will be found notes on: "The London Building Act: Party Walls."

Law Reports (p. 84) include: "Damage by Sewage Flooding"; "Action by Contractor against Building Owner."

MEETINGS.

FRIDAY, JULY 21.

Architectural Association.—Annual exhibition of students' work. 3 p.m. to 6 p.m.

SATURDAY, JULY 22.

Institution of Municipal Engineers (Eastern District). Annual meeting at Goode's Hotel, Marine-parade, Yarmouth. 2 p.m. A paper, "Construction, Maintenance, and Repair of Highways," by Mr. W. Astley Norris, Surveyor to the Swaffham Urban District Council, will be presented for discussion.

Edinburgh Architectural Association.—The annual excursion will take place to St. Andrews.

MONDAY, JULY 24.

Builders' Beneficial Institution.—Annual general meeting of the subscribers and donors. 4 p.m.

MONDAY, JULY 24, TO SATURDAY, JULY 29.

The Royal Sanitary Institute.—Congress at Belfast.

TUESDAY, JULY 25, TO WEDNESDAY, AUGUST 2.

Royal Archaeological Institute. Summer meeting at Cardiff and Tenby.

WEDNESDAY, JULY 26.

United Builders' Alliance. General meeting at the Athenaeum, Muswell Hill, N. 8 p.m.

THURSDAY, JULY 27.

Nottingham Architectural Society. Annual excursion to Windsor.

Guild of Architects' Assistants.—Visit to the Royal Academy of Music, Marylebone-road, N.W.

SATURDAY, JULY 29.

The Institution of Municipal Engineers.—Meeting at Edinburgh.

Midland district and special meetings to be held at Handsworth, near Birmingham.

BOOK RECEIVED.

REINFORCED CONCRETE BEAMS AND COLUMNS. By W. N. Twelvetrees. (London: Whittaker & Co. 6s. net.)

COMPETITION NEWS.

Deptford Central Library.

The Public Libraries Committee of Deptford Borough Council report having been in negotiation with the President of the Royal Institute of British Architects (Mr. Leonard Stokes) with regard to the appointment of an assessor to judge the designs which have now been received for the erection of a central library. Mr. Stokes informed the Committee that he would be prepared to judge the designs himself, and the Committee has appointed Mr. Stokes to carry out the adjudication.

Rochdale Infirmary.

Mr. Alexander Graham has been appointed assessor for the limited competition which will shortly be instituted in connexion with the King Edward extensions to the Rochdale Infirmary. Provision will be made for forty-eight beds, and the cost is estimated between 15,000*l.* and 17,000*l.*

Seale-Hayne College (Agricultural and Technical), Newton Abbot, Devon.

The assessor's award in the competition for the Seale-Hayne College buildings is as follows:—First prize, Design No. 17 (Messrs. W. H. Mitchell, Son, & Gutteridge, 9, Portland-street, Southampton); second prize, Design No. 8 (Mr. Josias Beare, A.R.I.B.A., 42, Devon-square, Newton Abbot); third prize, Design No. 31 (Messrs. Crouch, Butler, & Savage, 39, Newhall-street, Birmingham).

MAGAZINES AND REVIEWS.

The *Art Journal* this month is mainly devoted to decoration and furniture and the articles on the "Chinese Taste" in English decoration, Holkham, tapestry weaving in England, Chinese porcelain, and silver candlesticks are all illustrated from examples of exceptional interest. The designer and the collector will regard this issue as one of notable value.

The *Burlington Magazine* has an article by Mr. Aymer Vallance on the Flemish glass panels taken from Kilburn Grange when demolished in 1910. Other articles on a family of Flemish painters, the French mission to Chinese Turkestan, and Bartolomeo Vivarini deserve attention.

In the *Connoisseur*, the illustrated article on "Antique Mirrors," by Mr. Egan Wren, dealing mainly with designs of the XVIIIth and XVIIIth centuries, is of special interest to the architect, while that on "Anders Zorn" gives an outline of the work of that artist. We cannot congratulate this magazine on the increased use made of three-colour illustrations. These are rarely so successful in reproducing the quality of a picture as a good monochrome print.

In the *Nineteenth Century* will be found an article on "The Railways of India," by Mr. Murray Robertson, in which the question of railway developments in the past and the future is reviewed from the points of view of commercial and military requirement, policy and finance. Mr. Herbert G. Jenkins in another article shows how he has been enabled to trace the position of the grave of William Blake in Bunhill Fields. This grave was used for no less than eight burials, one above the other, and is at present immediately under one of the footpaths.

The *National Review* contains a brief note on the building of Prior Park, Bath, in the introductory paragraphs of an article by Mr. Austin Dobson on Ralph Allen and the more distinguished guests he entertained at his great mansion. The contribution entitled "The Rejected of the Academy" is a scathing criticism on the methods in vogue at Burlington House, which, it is claimed, justify the deposition of the Royal Academy from its official position. With regard to the Exhibition, it is suggested that the sixteen galleries should be apportioned among the chief art societies of the kingdom, and each society should enjoy absolute independence in the selection and arrangement of works in its own section.

ILLUSTRATIONS.

The Chapel of the Order of the Thistle, Edinburgh.

HIS chapel is designed by Mr. R. S. Lorimer, A.R.S.A., F.R.I.B.A., whose work, chiefly domestic, cannot be unknown to our readers. In the execution of his design he has enjoyed the loyal and intelligent co-operation of the craftsmen engaged, many of whom have been associated with him for a considerable time. The builder was Mr. John Kennedy (Colville & Co.). The structural oak work of the stalls, etc., was done by Mr. Nathaniel Grieve, the carving by Messrs. W. & A. Clow. The stone-carving was carried out by Mr. Joseph Hayes, Edinburgh. Mr. James Grieve acted throughout as clerk of works. The St. Andrew's window was designed and executed by Mr. Douglas Strachan, of Edinburgh. The other heraldic windows were made from cartoons supplied by Mr. Louis Davis, of Pinner, N.W. The enamel of the stall plates was designed and executed by Mrs. Traquair; their copper plates were prepared by Mr. Kirkwood, St. James-square, Edinburgh. The wrought-iron screens were executed by Mr. Thomas Hadden; all the mantlings were made and embroidered by Mrs. Drew, Comely Park, Edinburgh. Our photographs are by Mr. F. C. Inglis, Calton Hill.

FIFTY YEARS AGO.

From the *Builder* of July 20, 1861.

The Parthenon, Proposed, in Paris.

In one of our recent articles on matters in the French metropolis we intimated our disbelief of a report of an intention to clear away the hill of Montmartre, and expressed the hope that a passion for making things even and straight, which comprises what is one of the deductions to be made from the general merit of the improvements in Paris, would not extend to the deprivation of what affords one of the finest features of the capital. If a statement which has since appeared in *Le Siècle* be correct, and if a project which is mentioned be likely to be carried into effect, we need, on the matter first in question, have no further apprehension.

The asserted project is no less than one of a reconstruction of the Parthenon of Athens—that is, if we understand rightly, as the original was built, or in what is called a restored state.

If the report be correct we cannot but think the intention is not consistent with the position of the French in art. A noble work of architecture on the hill of Montmartre might add, like the Parthenon to Athens, a crowning glory to what is now almost as grand a city; but we do not see that this addition need be a copy of any ancient building; and for the credit of French art we hope it may not. The architects, M. Hittorf not the least, ought to disclaim connexion with the project. If there be any truth in the theory that competitions have for their aim the bringing forth of new talent, the notion of such a mode of selection of the architect of a "reconstruction" of the Parthenon has absurdity on the face of it.

BESTOWAL OF HONOURS.

Upon the occasion of his visit to Wales last week, the King conferred Knighthood upon Mr. William Goscombe John, R.A. (a native of Cardiff), who designed the insignia, executed by Messrs. Garrard, for the Investiture of the Prince of Wales. At Dublin Castle on July 12 the King invested Sir George Holmes, C.V.O., Chairman of Public Works, Ireland, as K.C.B.; Mr. F. W. Moore, Curator of the Royal Botanic Gardens, Glasnevin, as Knight; and Mr. C. A. Stevenson, Commissioner for Public Works; Mr. A. Robinson, Principal Surveyor of Buildings; and Mr. Henry Williams, Secretary to the Board of Works, were invested as Commander and Members respectively of the Royal Victorian Order.

MONTHLY HISTORICAL REVIEW.

A FORGOTTEN ARCHITECTURE OF THE FAR EAST.

WHILE the art of the Farthest East has long been relatively well known in Europe, where on the first it aroused interest and exercised an influence, that of the less stant though still Far East, of the great peninsula which has to be circumnavigated in order to reach the coasts of China and Japan, has remained virtually a closed book all but specialists. The European Powers have been in contact with Further India at least as long as they have with China and Japan, for the relations of the Portuguese and Dutch with it date from the XVIth century, and those of France and Great Britain from the XVIIth, yet a sort of mystery has hung more or less over this vast and fertile land with its ancient history and civilisations. There is a certain ambiguity about all that concerns it which is reflected in its alternative name of Indo-China.

Owing to the constant struggle of conflicting races, their frequent and prolonged wars with each other and with neighbouring States, and the competition for supremacy between rival kingdoms, Further India never attained sufficient unity to create a distinctive and homogeneous civilisation which could make its influence felt abroad. Its lot has been rather to be influenced by its neighbours in religion, literature, and art, through repeated waves of immigration, through conquest, commerce, and missionary effort. As various peoples have not, however, merely adopted the customs and methods of others, they have adapted them and assimilated them to their own genius and their own purposes. The foreign elements grafted on to the native stock have been modified so as to assume a peculiar growth all worthy of study. The three greater territorial divisions of Further India at the present time—Burma, Siam, and Annam—are occupied by races who rose into importance in comparatively modern times—that is to say, in the second millennium of our era—at the expense of the former occupants. They are all of Mongol kinship, the Burmese deriving their origin from Tibet, the Annamese from Szechuen and Yunnan, and the Siamese from Tongkin. Among the races earlier in the field were the Mons, of uncertain origin, but probably akin to the Malays. This people was divided into two main branches, the Chams or Tyams and the Khmers, who between them ruled at one time or other a large part of the peninsula, especially its south-eastern portion. Champā, the Cham Empire, with its centre in the upper basin of the Mekong, more than once extended its sway into Siam and down to the coast of Annam, while Cambodia, the Khmer Empire, when at the height of its power, spread from its seat at the mouth of the Mekong as far as Pegu and Tongkin. These two kindred races were frequently at war. The Chams, whose greatest prosperity is reached in the first 400 years of our era, being most exposed to attack, were the first to enter into a long period of decline, till their final annihilation by the Annamese in the XVth century, when the remnants of the population took refuge in the mountains of Cambodia. The Khmers, or Cambodians, were introduced into importance in about A.D. 500, reached the climax of their power from the VIIth to the XIIth centuries, and then in their turn began to fall back before the invading Annamese and Siamese. They revived, however, as an independent State in 1863, when the declaration of the French Protectorate saved them from extinction. (All Further India received its civilisation either from China or India, Chinese influence

preponderating in the north and east, Indian in the south and west. The Chams and Khmers owed theirs almost entirely to Hindu settlers, merchants, and missionaries. Brahmanism in the form of both Vishnuism and Sivaism overlaid their primitive snake worship at an early time. Buddhism, on the other hand, took little hold upon them, but in later times Mohammedanism was introduced with greater success. From India, too, came both writing and art.

It is only of recent years that the artistic remains of these peoples have emerged from the oblivion which had overtaken them even in the land of their origin. It is principally to the labours of a series of French savants, working with the support of the French Government, that a knowledge of these interesting monuments has become available. A naturalist, Henri Mouhot, first visited the Cambodian ruins (1858-61), while M. Aymonier, a colonial official, followed up his researches (1880-5). By the creation of a French School of the Extreme East in 1898, under the control of the Académie des Inscriptions et Belles Lettres. M. Paul Dummer, Governor of French Indo-China, gave a sister institution to the older schools of Rome and Athens, whose function is to promote the study of the history, ethnology

and languages, archæology and arts of Indo-China and neighbouring lands. Under its auspices more systematic researches have been carried out, especially by Messrs. H. Parmentier and E. Lunet de Lajonquière, resulting in the publication in several instalments of a great "Inventaire Descriptif." All known existing remains of ancient art in the French possessions are catalogued, and whether portable or otherwise are protected by official decrees from destruction or alienation. In the case of monuments they are surveyed and photographed, and, while no restoration is attempted, measures are taken to arrest decay, particularly by the removal of that luxuriant vegetation, which in a tropical climate makes such rapid and unceasing inroads upon the handiwork of man.

Fergusson remarked: "Since the exhumation of the buried cities of Assyria by Mons. Botta and Mr. Layard nothing has occurred so startling, or which has thrown so much light on Eastern Art, as the discovery of the ruined cities of Cambodia." Since that day a similar though less important or sensational discovery has been made in regard to the monuments of Champā. The "Inventaire" relating to Cham art appeared in 1909. *L'Art Décoratif*, for April, 1911,

Fig. 1. Central "Kalan" of a Cham Shrine.

(From "L'Art Décoratif.")

Fig. 2. Cham Capital from Mi Son.
(From "L'Art Décoratif.")

has an interesting article based upon it, from which we have borrowed some of our illustrations. While the architecture of the Khmers and the Chams are closely akin, they are distinguished by certain differences. Both are of Hindu origin, both show those strange reminiscences of classical architecture visible in India from Kashmir to Ceylon, and ultimately traceable to Greek influence. Both, too, exhibit the Hindu type of sanctuary, consisting of a vaulted shrine within a walled enclosure, entered through a gatehouse, or *gôpura*, on the east, and preceded by an assembly-hall. In both the shrine consists of a rectangular structure in several receding stories, a type probably derived from the same wooden origin—i.e., some sort of pagoda—which gave rise in India itself, in later times, to the great temples of Vijayanagar and Tanjur. Both, too, use the Hindu system of corbelled vaults, and are ignorant of the true arch and vault, which were used

structurally, if not decoratively, in Burma from a very remote period. The chief building material is red brick, stone being used where long bearings, greater strength, or important ornament is required. The Cham sanctuaries are, however, relatively simpler and less extensive, and appear not to have possessed more than one enclosure, which always consisted of a simple wall without galleries or angle towers; they also differ in minor points of architectural treatment and decoration.

The Cham remains, of which two of the most important groups are at Mi Son and Dong Duong, consist almost wholly of religious edifices; secular buildings having probably been entirely of wood and roofed with

thatch, only able to survive in that hot, moist climate if kept in constant repair. They appear to date from about the VIIIth century. The towerlike shrine, which is known to the natives as a *kâlan*, lies in the main axis of the enclosure (Fig. 1). It is entered from the east by an enriched doorway, and has similar doorways pseudo-doorways on the remaining sides. The faces and angles are treated with pilaster strips, often coupled, standing on a heavily moulded plinth, and carrying an equally heavily-moulded entablature both with frequent *ressauts*. The angles of the cornice are emphasised by a slab variously enriched and of strong projection. Between the pilasters the wall surfaces are adorned by statue-niches similar to the doorways, but on a smaller scale. The angles of the ledge above each story is occupied by a pinnacle consisting of a miniature reproduction of the entire *kâlan*. The treatment of each story of the *kâlan* is a repetition of the one below except that the finial is conjectured to have been domical, as the pinnacles occasionally are.

The shrine is sometimes preceded by porch of the same design as itself, but on smaller scale, and sometimes flanked by a pair of smaller shrines. The gatehouse is another such reduced *kâlan*, and similar small *kâlans* containing *stêla* are dotted about the site.

The assembly-halls outside the enclosure were too wide to be covered by corbel vaulting, and are consequently now roofless. They are oblong in plan, and their elevations are treated similarly to those of the *kâlan*, but the walls are pierced with square windows whose lintels are carried by balusters rather clumsy outline.

The detail and ornament throughout are based on Indian prototypes. Numerous statues occur of many-handed deities from the Hindu pantheon, together with peacock elephants, apes, cobras, and fabulous monsters. The reliefs, which adorn various portions of the structures, seldom attain

Staircase in Angle of Court.

size or comprise more than a few figures. pilasters, tympana, acroteria, etc., often enriched with a kind of arabesque consisting of foliage bearing a far-awayness to the blunted acanthus, and not dissimilar to the curly cabbage dear to the Phœnic carvers. The pilasters, friezes, and abutments consist, as in India, of many superposed bands of enriched mouldings. Doorways and niches are flanked by groups of pilasters, and sometimes by engaged piers of octagon plan with annulets, bases and capitals (cf. Fig. 3). Fig. 2 shows a beautiful capital of Doric type, passing into the octagon to the round, and carrying a square abacus, the cyma carved with two tiers of lotus leaves. The crowning member of these features consists in a sort of horseshoe pediment of flamboyant outline, the extrados is formed of, or supported by, the *makara* or conventional-crested lion (cf. Fig. 7).

The most important parts of the sculpture decoration are cut in stone, but a good deal of the ornament is in brick; both, however, believed to have been inspired by the wood carvings which adorned the ephemeral structures of an earlier period (cf. Fig. 3). A few of the Cham monuments, such, for instance, as those at Van-Thong, are of a date nearer to the Khmer style, dating from the time when the Khmer power was in the ascendant. The principal difference lies in the treatment of the wall surfaces, which instead of being emphasised by pilasters at angles, step forward towards the centre in a series of flat breaks, thus approximating a curved form, and preparing the way for a structure of quasi-circular plan. Other distinguishing characteristics are the introduction of long sculptured friezes, the omission of the angle slabs and the greater richness and elaboration of the pediments. These architectural remains are not the relics of the Cham power. The treasure of the Cham kings are still jealously preserved in the savage Moïs of the Phanri plain. It

consists of a large variety of articles precious in substance and of rich workmanship, partly Hindu and partly Chinese in character, including diadems, mitres, robes, jewellery, armour casquets, amulets, and vessels of various kinds. All these have been photographed by order of the French Government, and catalogued with a view to prevent their destruction or dispersal.

If the far more splendid architecture of the neighbouring Khmers has been relegated to the end of the article, it is because the humble efforts of the Chams are less known. Indeed their discovery is so recent that it does not figure in the admirable chapters on the architecture of Further India, rewritten and expanded by Mr. R. Phené Spiers for the recent edition of Fergusson's "History of

Indian and Eastern Architecture." To his kindness we owe the loan of several of our illustrations.

Cambodia had a much longer period of power than Champâ, and indeed it was largely at the expense of its weaker neighbour that it acquired the wealth and the army of slaves which allowed it to carry out stupendous works of engineering and architecture so long lost sight of by the descendants of the builders but rediscovered in our day by foreigners. Cambodia consists largely of alluvial plains, exposed to yearly inundations, and the whole country is covered with a rectangular network of raised causeways. It was their points of intersection that the great sanctuaries, such as those of Angkor Vât, Bayon, and Beng Mealea, were erected by the Cambodian kings at their period of prosperity from the IXth to the XIIIth centuries. The Khmer builders developed the system found in germ in the architecture of their predecessors. They achieved greater magnificence in their sanctuaries by following the principle of reduplication or multiplication of a single motive already pointed out in the Cham monuments. Thus the porch added to each side of the square shrine has another smaller one added in front of it, and yet a smaller in front of that, till the square plan approaches a circle. The form of the shrine itself is repeated on a smaller scale at various points, and used in miniature as a pinnacle. Enclosure after enclosure is added one outside the other, till the holy place becomes a vast complex of courts and structures (Fig. 4).

These enclosures, one within the other, are surrounded by vaulted and pillared galleries with angle towers, and divided by cross galleries into courts, some of which are vast tanks, while others were spacious enough to accommodate the residences of the Sovereign and his court. The outermost enclosure at Angkor Vât measures about two-thirds of a mile in length, and was itself surrounded by a broad moat in which its walls were mirrored. The successive enclosures often rise in stages one above the other, giving the total scheme a pyramidal form and affording occasion for a series of steps, terraces, and porticoes (Figs. 5 and 6).

In the magnificence of conception and regularity of setting out these Cambodian sanctuaries can scarcely be paralleled in architectural history except by the gigantic temples of the Roman Emperors. For a general *coup d'œil* viewed from outside and at a distance they must have been more effective than the latter. But they lack the restraint which, even in Rome, usually prevented the piling up of vast masses of minute and redundant ornament. Internally, however, the ignorance of the Khmer

Second and Third Enclosures.

Fig. 7. Reconstruction of Entrance to Khmer Temple in Trocadero Museum.

builders of the science of vaulting, one of the greatest glories of the Roman builders, precluded them from the erection of spacious and lofty halls; for corbel vaults do not permit of greater width than about 12 ft. But what they failed to attain in width they strove to make good in length, and their sanctuaries are full of the long perspectives of pillared galleries, covered with pointed barrel vaults, and with one, or occasionally two, aisles covered with half barrel vaults. These vaults were originally concealed by flat wooden ceilings, richly carved and painted, of which some traces are still to be found.

The Khmer sanctuaries surpass those of the Chams in richness as much as they do in dimensions. They make a much larger use of stone, while still employing brick for walling and even for parts of the enrichments. Their mouldings differ from those of the Chams in section and are more elaborately carved; the sculpture is more profuse, the reliefs often running to immense compositions containing hundreds, if not thousands, of figures. The magnificence of these gigantic structures before decay overtook them and the jungle swallowed them up must have been such as can hardly be imagined, and well may the degenerate descendants of the great medieval builders, who have long forgotten their own glorious past, attributed their erection to the agency of angels.

A kindred people, another branch, perhaps, of the same Malayan family, settled in Java, produced temples of a very similar character and almost equal magnificence. The genius displayed by this race for assimilating and adapting to its own purposes an architecture of foreign importation and doubly foreign origin is most remarkable. The Malayan peoples must be reckoned among the great building peoples of the world, even if it should not be possible to establish a link between them and the wonderful Xth century ruins of Yucatan, which exhibits such startling analogies with the architecture with which we have been dealing and its Indian parallels. If this link be no mere fancy we should have to revise our views of history and recognise that European culture first reached America, by way of the east, centuries before

Columbus, and one more proof would be afforded from a very unexpected quarter of the widespread dominance of the Hellenic genius. What a fairy tale it would be, if it could ever be told, that Odysseus of the Greek column and entablature drawn across the deserts in the train of Alexander's triumphal car, spread throughout India by the agency of the semi-Hellenised princes who reigned in Persia and Rajputana in the succeeding centuries, ferried over the Indian Ocean to Ceylon, Indo-China, and Java by Brahmin missionaries and craftsmen, and then across the Pacific by Malay conquistadors, anticipators of Cortes, to moulder in the jungles of the Gulf of Mexico.

THE EXHIBITIONS AT ROME IN 1911.—III.

THE EXHIBITION OF RETROSPECTIVE ART AT CASTEL S. ANGELO.—II.

HAVING dealt with the foreign sections, it will be best to continue our survey of the rest of the exhibition mainly in the local order, i.e., in the sequence in which its various parts would actually be visited.

The remainder of the building which contains the sections allotted to Belgium, Hungary, and those South American Republics which are taking part in the exhibition was ready later than the rest. It also contains a series of studies of the Churches of S. Maria in Cosmedin and S. Saba, exhibited by the Società Artistica, tra i Cutlori di Architettura (which was instrumental in the removal from them of the additions of the XVIIIth and XVIIIth centuries, and their successful restoration to their former condition), and drawings of interesting buildings which have been removed in the course of modern improvements, exhibited by the same Society; a fine set of drawings of the mediæval castles of the Roman Campagna, by Signor Ferrari; and engravings and drawings dealing with the topography of the environs of Rome. At the back of the building is an interesting curiosity—the State train built for Pope Pius IX. for his journey through the Papal States, containing even a private oratory.

Below this is a barrack built by Urban VIII., the upper floor of which contains the exhibition of Roman topography, which is

illustrated by means of plans and views (pictures, drawings, engravings, rare books, and a few photographs) of Rome from the XVth century onwards, carefully selected in order to show the changes which the city has undergone in the course of successive alterations and "improvements." The objects lent are in the main the property of the State and of the Commune of Rome, though private owners have also contributed. The corridor contains a fine series of plans and panoramas of the city, much more complete than that exhibited by Dr. Thomas Ashby at the Town Planning Exhibition in London in October last, inasmuch as it was possible to draw freely on the resources of the Vittorio Emanuele Library, the chi Government Library in Rome. A copy of water-colour of Bufalini's plan of 1551, and copies of Giovanni Maggi's woodblock plan (period of Paul V.), and of Greuter's engraving plan (1618) are among the greatest rarities. The rest of the corridor is devoted to some fine large water-colours of the Tiber before the construction of the new embankments in the "eighties" and "nineties," by the late Ettore Roesler Franz, which are precious both as records of what has disappeared and as works of art. The remainder of the drawings of "Roma Sparita" ("Vanished Rome") are placed in the regions to which they belong, for the distribution of the rest of the contents of the exhibition is topographical, the city being divided up into twenty-three sections, each one of which occupies a small room; thus we have, on the right of the corridor, Castel S. Angelo itself, then S. Peter's, then the Janiculum and so on, and on the left, the Piazza del Popolo and its surroundings, then the Piazza Colonna, Fountain of Trevi, and Pantheon and so on. To describe the exhibition in detail would exceed the limits of the present article, but it may safely be said that it gives a survey, hitherto unobtainable, of the growth of the city of Rome as we now see it, and one cannot help feeling how much the picturesque and beautiful has been lost, was inevitably, it may be, in many cases (though that is a vexed question), but not the less regrettable. Among the objects of special interest may be mentioned a series of fine drawings of Rome by Vanvitelli (V. Wittel, a Dutch artist) of the early XVIIIth century; some coloured drawings of the churches of Rome, by Achille Pinelli, brother of the more famous Bartolomeo; and a large model of the mediæval Lateran made specially for the exhibition.

The lower floor of this building is devoted to offices and meeting-rooms for the many various Congresses which are to meet in Rome during 1911, and so is the lower floor of the corresponding building on the opposite side, while the upper floor of this last contains an interesting museum of military engineering, with models and plans of fortifications from the Renaissance onwards; this was opened as early as last February, and is a permanent institution.

From this point we cross a newly-made garden and enter the outer (square) port of the Castle itself by a small gate with drawbridge. There we find a section devoted to mediæval sculptures, and a room containing some specimens of the work of the Cosmates in which the place of honour is occupied by the splendid casts of the shrine of Edward the Confessor and the tomb of Henry V. in Westminster Abbey, executed under superintendence of Cav. Formigli, described by him at a meeting of the Royal Institute of British Architects early in the year. Above are sections dealing with mediæval painting in Rome and with costumes, the latter rather miscellaneous, but containing some interesting objects. A room on the opposite bastion is also devoted to costume, and another to sculptures, associated with Bernini.

Passing now to the front of the Castle we enter the building itself, the great mass that once was Hadrian's tomb. To ascend the mediæval ramp which pro-

through the sepulchral chamber and reach Cortile delle Palle, so called from the balls of stone cannon-balls which are stored there. In the rooms on the right are most artistic imitations of an XVIIIth-century jeweller's shop and of an alchemist's kitchen, a fine exhibition of old surgical instruments, mortars, documents, herbals, etc., a large collection of the beautiful maiolica used by Italian hospitals and chemists in the XVth century onwards, the hospitals of Rome having contributed freely of their treasures. A collection of maiolica in chronological order, showing the development of the fabric, is placed in the Sala Apollo, one of the rooms in the central division, between the two courtyards, which was decorated for Pope Paul III. Raphael's pupils. An adjacent room, with a ceiling of the time of Clement VII., is set up as a bedroom, containing a bed and other objects of splendid XVIth-century work; ironwork.

The other rooms contain objects connected with the history of the Castle—inscriptions related with its castellani or governors, a fine tombstone of one of them, inscriptions and architectural fragments, parts of it which have had to be demolished, XVth and XVIth century maiolica found in the course of repairs (many of them with the arms of the Borgia family, which Pope Alexander VI. belonged to), etc. The rooms surrounding the court on the other side (that which contains a beautiful well-head of white marble, covered recently by a modern building, and before well preserved, with the arms of Pope Alexander VI.) are given up to an interesting collection of musical instruments. Ending to the floor above, we find the Sala della Biblioteca, so called from its use for this purpose under Pope Paul III., now devoted to an important exhibition of sculptures by, and portraits of, Michelangelo, and pictures by him and his assistants, arranged by Professor Ernst Stein. Some of the adjacent rooms contain tapestries and brocades; and a spiral staircase, not long ago discovered to be Roman, leads to a room until recently devoted to a collection of the military museum, but now adapted, as are some of the rooms beyond, for the exhibition of Renaissance armour, which is of considerable interest and importance. Returning to the Sala della Biblioteca, pass along a corridor to the great hall, created for Paul III. by Perino del Vaga; this is the apartments of that Pope, decorated with frescoes, which have only in recent years been restored; they have been on the occasion of the exhibition been set up with furniture and pictures of the old, so as to give an image of their former splendour. Among the pictures which now decorate them are some works of considerable importance, but by private owners, notably a beautiful Annunciation by Filippino deli, belonging to Miss H. Hertz, a fine picture, lent by the Torlonia family, and others.

It will readily be understood from the foregoing description that the exhibition is of a somewhat miscellaneous character, and that neither the selection nor the arrangement of the objects exhibited is in all cases fully systematic, though this varies considerably in the different sections. To those who know the Castel S. Angelo, and its ascents and descents, its meandering passages, its rooms of all sorts, shapes and sizes, it will be clear that consistency would have been impossible, and it was well that an attempt at it was made. What has been done is to bring together a number of objects of considerable interest and beauty, illustrating associations with the life of Rome in the past, and to place them, in most cases appropriately, in the picturesque backgrounds which the rooms of the Castel S. Angelo so richly afford. And if the present exhibition leads, as it is intended it should, to a better knowledge of this remarkable place and to the establishment there of a

permanent medieval museum, like the Bargello in Florence (a thing which has hitherto been lacking in Rome) much good will have been done. In the meantime, it may safely be said that the exhibition greatly enhances the interest of what was before one of the most attractive "sights" of Rome—perhaps the one building that of all others presents us with the best epitome of its history from the days of the Empire onwards.

ANCIENT MONUMENTS AND HISTORIC BUILDINGS.

UNDER the Ancient Monuments Protection Act, 1852, Lieut-General A. Pitt-Rivers was appointed Inspector of Ancient Monuments. On his death in 1900 the office remained vacant, though informal inspections were made by Mr. J. Fitzgerald, I.S.O., Assistant Secretary to the Commissioners of Works, till his death in 1909. But in March, 1910, Mr. C. R. Peers, M.A., Secretary to the Society of Antiquaries, was appointed Inspector by the Treasury at the instance of Mr. Harcourt. His Report for the year ending March 31, 1911, has recently been issued, and is a very interesting document.

The number of monuments under the protection of the Commissioners is now 104, ranging from a single stone to an important complex of buildings, such as Dover Castle. Of these forty-five are prehistoric—dolmens, standing stones, earthworks, hut circles, etc.—and the remainder historic—castles, ecclesiastical and domestic buildings, town walls and gates, sculptured or inscribed stones. Within the year ten monuments in England and Wales and five in Scotland have been placed under the protection of the Act. Of these ten are prehistoric—eight in Anglesey and two in Orkney. Those of historic times are Nottland Castle and Eynhallow and Pierwall churches in Orkney, part of the earthworks of Skipsea Brough in Yorkshire, and the Abbott's Fish-house, Meare, Somerset.

The Report gives an account of the condition of the monuments under the protection of the Act, and of the works of upkeep and exploration carried out during the year. Only such works of repair are undertaken as are necessary to preserve the monuments from further decay, while in some cases modern disfigurements are removed. Among the most important buildings which have undergone such works are Glasgow Cathedral (the roofs), the Chapel Royal, Holyrood, and Stirling Castle, the Tower of London, Richmond Castle, Yorkshire, Old Sarum, and Tyne-mouth Priory. Mr. Peers points out that the Act of 1900, which greatly widened the scope of that of 1802, though still unfortunately but little known, has had beneficial effects. *Inter alia*, it has permitted of monuments belonging to other State Departments (such, for instance, as the War Office) being cared for by the Commissioners. Monuments, too, in private ownership may be placed under their guardianship. When such are offered, they are inspected and reported upon, and if they are in a state of disrepair resulting from the owner's neglect he is called upon to bear a portion of the cost of repair as a preliminary to acceptance.

The Report concludes by enumerating the measures which should be adopted in order to secure the most effective protection of a monument as follows:—

- (i.) Structural and superficial repairs, i.e., grouting, underpinning, pointing, treatment of decayed surfaces, removal of ivy and weeds, etc.
- (ii.) Enclosure by fencing where necessary.
- (iii.) Care of the site, i.e., grass-cutting, prevention of disfigurement by visitors, the provision of notice boards, etc.
- (iv.) The preparation of accurate and complete measured plans, elevations, and sections.
- (v.) Photographs.
- (vi.) The compiling of official guide-books to single monuments or to groups of monuments.

In an appendix, a report on Mr. J. M. Watson's proposals for the restoration of St. Magnus Cathedral, Kirkwall, is given, in which the scheme is examined under three heads:—(i.) Proposals based on the condition of the structure, (ii.) proposals involving

"restoration," (iii.) new fittings. The Inspector approves the first, but condemns, or at least severely criticises, the second and third. In view of the fuller information now given by him on the scheme than we had before us when we referred to it in our issue of August 20, 1910, in terms of guarded approval, it would appear that his strictures are justified. That the Commissioners should have the power in this case to prevent unnecessary tampering with an historic building (whose object, he is remarked, is principally to spend a legacy) is in itself a proof of the utility of the Acts.

WALL PAINTINGS IN SURREY CHURCHES.

MR. PHILIP MAINWARING JOHNSTON'S paper in "Memorials of Old Surrey," which has now been reprinted separately, contains an exhaustive account of the paintings existing at the present time, or till recently, in the churches of that county, and some twenty-five illustrations, comprising both photographs and careful drawings by the author.

For the churches of the two counties of Surrey and Sussex Mr. Johnston claims the glory of containing a greater wealth of wall painting than those in any other six counties. Many of the examples of such decoration described by him are mere fragments, such as the remnants of simple Norman fret and saw-tooth patterns of about 1100 at Godalming. These are among the earliest examples in England, and only escaped the mischievous Restoration of 1840 owing to their being in the splays of blocked windows, which were not opened out till 1879. Equally fragmentary are the vine and floral patterns on the soffit of the east window at Shere of 1320, and the very beautifully-drawn lily at Horley of the same period.

Others are fortunately more extensive, and comprise figure subjects of great interest. Extremely quaint and vigorous, for instance, is the figure of a scourger at Pyrford from scenes of the Passion and other Scriptural subjects, dating from the middle of the XIIIth century, the time of the erection of the church, and found underneath another series of the XVth century in too bad condition to be saved.

The paintings in St. Mary's, Guildford, are surpassed in importance by only one example in the county. Yet even here much has been lost. So late as 1896 a portion was destroyed by "workmen let loose in the church with a general order to whitewash everything! The famous paintings in St. John's Chapel were only rescued just in time." These are, in Mr. Johnston's view, of two dates c. 1185 and c. 1210. The later portions include a number of figure subjects in medallions on the series of the vaulting, representing scenes from the lives of the Saints.

The most remarkable wall painting probably in the British Isles is that in the tiny hill church at Chaldon discovered in 1871, and preserved by the then rector. It was executed towards the end of the XIIIth century, perhaps, by a monk of Chertsey. It occupies the whole width of the west wall, viz., 17 ft. 3 in. and is 11 ft. 2 in. high, reaching almost to the floor. This space is divided horizontally by a band of ornament and vertically by the "Ladder of Salvation," on which the souls are represented attempting to make their escape from the powers of hell to Paradise. The subjects of the four compartments thus formed represent, below, the Tree of the Knowledge of Good and Evil and the Torments of the Damned, and above, "The Harrowing of Hell" by Our Lord and the Weighing of the Souls. The companion pictures representing the earthly and heavenly Paradise probably occupied the return walls to north and south, the former of which at least is known to have been painted. In an unmastered age, when faith in the church's teaching was still unshaken, the naïve realism of these paintings must have produced an unforgettable impression on the simple minds of the village folk, filling them with the horror of fear and rapture of hope at the literal fulfilment of the scenes depicted. Compared with these robust, if grotesque and childish, representations of the future life, the XVth-century painting of Charwood (P. IV.) has an unpleasantly sophisticated flavour, and betokens morbid

revelling in the "macabre." It is one of the type of which Holbein's "Dance of Death" was the culmination, and represents "The Morality of the Three Living and the Three Dead." Three half-unfleshed skeletons are grinning at three kings in the pride of life, in the midst of a hunt, and seem to say—

Loke, such as we ar, such schall ye be,
And such as we were, such be ye.

The record which Mr. Johnston has given us is an invaluable one, and the more so since it is to be feared that in many cases the paintings which have survived the Reformation, the Civil Wars, and "Restoration" will fade away under the influences of the climate unless those under whose charge they are can be induced in time to apply the spray treatment recommended by the author and successfully used by him in certain cases.

HISTORICAL NOTES.

Ancient Jerusalem.

THE *Times* of May 5 gave a brief account of the results of Capt. Parker's excavations at Jerusalem begun last summer. The most important of these are the determination of the site of the Jebusite city captured by David, which the pottery found proves to have been in existence some 2,000 years before that event. The search for the tombs of David and Solomon has proved fruitless; nor have any Hebrew inscriptions of that period come to light. The spring of the Virgin's Well, and the tunnel leading to the Pool of Siloam, which is 1,760 ft. long, were cleaned out, whereby not only was an accurate survey of these works rendered possible, but the water supply largely increased to the delight of the neighbouring villagers, who held a feast in honour of the occasion.

Roman Remains in the River Wye.

AN important letter by Mr. James G. Wood, F.S.A., recently appeared in the *Standard* on the subject which has been brought into public notice by Dr. Owen's nonsensical operations in the River Wye. The site of these is half a mile above Chepstow, at the point where the Roman road between the important centres of Caerleon and Caerwent crossed the Wye, and is as likely to have been selected for a secret cache as "the middle of Cheapside." The crossing was effected not by a ford, as has been stated, the river being quite unfordable at this point, but by means of a bridge whose remains are still visible, though partly destroyed by Dr. Owen; they were so described by the writer. The portion recently exposed is the "starling," or footing, of a lateral pier identical in form with those of Old London Bridge. The fact that undecayed oak was found in connexion with these remains is no proof of a relatively recent building, as witness the condition of the Roman ship lately found in London. This Roman bridge was abandoned when traffic was diverted by the rise of the town of Chepstow. The writer further gives reasons to show that the wall, which Dr. Owen assumes to be that pointed to by his opher of 1610, is of an older one, a point which invalidates his identification of the position of Bacon's alleged hiding hole.

Explorations in the River Wye.

WHILE the works carried out in the River Wye by Dr. Owen have so far thrown but scant light on the question of the plays attributed by a possibly too traditional, but almost unanimous world to one William Shakespeare, they have elucidated a point of local archaeology in fixing the site of the Roman ford at Chepstow. A large timber-framed pier has been unearthed on the Monmouthshire side in good preservation, which gave rise in 1840 to Ormerod's theory that a Roman bridge stood in this position. A row of much worn piles embedded in a mass of stones have also been found. When the tides permit the structure will be further investigated.

THE *Scotsman* of May 29 contains an account of the works in progress with the object of preserving the remains of Kelso, Jedburgh, and Sweetheart Abbeys from further decay. These works, which have been undertaken with the worthiest motives and on the most scientific lines, involve

no attempt at "restoration," and in so far they deserve the gratitude of posterity. It is difficult, however, to read without some twinge of regret passages like the following:—"Care has been taken to eradicate these (the roots of plants) in a thorough manner, and to this end it has been necessary to take down several courses of masonry, to clean out the joint of all vegetation and then to rebuild." Archaeology is certainly of great importance, but, after all, natural beauty has its claims. Possibly another generation which has learnt all the crumbling remains have to teach may prefer a covering of grasses and ruddy wallflower wavering in the spring breeze even to a weatherproof coating of asphalt, or to see the mouldering masonry harmonised with the natural landscape around them by tufts of fern and patches of moss, or even yielded to the embrace of ivy tendrils, rather than fortified in the arid security of neat pointing. There can be no general rule in such matters, but where the remains are very fragmentary it might be a finer reverence to allow a graceful old age to resolve them once more into their component elements. Only those on the spot can judge, and far be it from us to criticise the generosity of those at whose expense these works of preservation have been carried out—the late Marquis of Lothian, Messrs. Oswald and Newall, and the Duke of Roxburgh respectively.

The Border Abbeys.—I.

THE history of Kelso and Jedburgh is similar. Both were foundations of David I., that "sair sanct for the Crown." Both suffered severely during the Wars of Independence, and in Henry VIII's invasions. In 1522 and 1523, and again in 1545, the English generals wrought such havoc that it is a wonder there was anything left for the ardour of Protestant fanatics to destroy. In each case a portion of the Abbey church was repaired and used as a parish church for a considerable period. At Kelso, where the plan is a Greek cross, the remains consist of the two aisles, a ruined east end, and two sides of the central tower. At Jedburgh, where the church was one of the largest of its kind in Scotland, the remains are more considerable. New Abbey in Dumfriesshire, which acquired the romantic name of Sweetheart Abbey from the fact that, when its foundress, Devorgilla, who was also the foundress of Balliol College, at Oxford, and the mother of the ephemerical king, John Balliol, was buried there, her husband's heart enclosed in an ivory casket, was buried with her. This religious house being further from the border, seems to have survived with little damage till the dissolution of the monasteries—considerable remains of its large Early Decorated church form a beautiful object on the banks of the Nith.

Bardney Abbey.

A REPORT has been issued by the Vicar of Bardney of the excavations carried out under his supervision, and that of Mr. Harold Breakspear on the site of Bardney

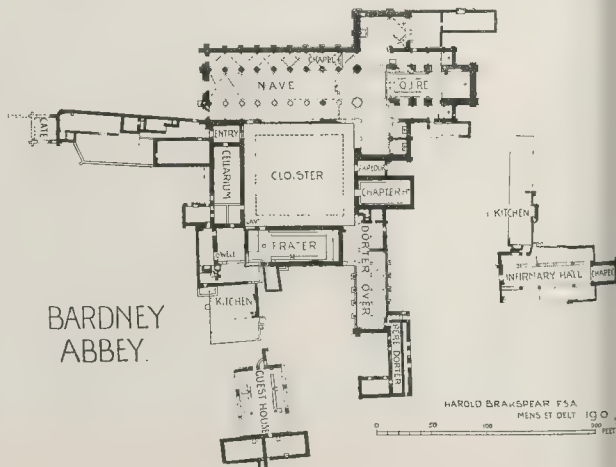

Abbey during 1909 and 1910. A great part of the site has been laid bare revealing the ground plan, which we reproduce. The church was begun at the east end in early Norman times and the west end was reached about 1240. The bases of the clustered piers of the arcade mostly of good early English work are now visible. As many as forty-four memoriae slabs have been found in the uncovered portion of the floor, those dated ranging from 1400 to the Dissolution. In the frater the stone seats and many of the stumps of the table legs are still *in situ*, and five of their carved capitals have been found. The works are still far from complete and more funds are required for the purpose. Meanwhile gifts and loans have permitted the purchase of the site, which is eventually to be made over to the National Trust or some similar body, and the formation of a local museum of architectural fragments and other objects found in the excavations.

The Protection of Ancient Churches.

WE trust that the report of the twenty-second congress of Archaeological Societies in union with the Society of Antiquaries, held last month, will bear fruit in preventing regrettable acts of vandalism too often committed through ignorance or lack of intelligent control. It stated that the Council had passed a resolution to the effect that the position of the Society of Antiquaries in advising diocesan authorities on matters of church restoration should be strengthened by the grant of additional powers through the Royal Commission on Ancient Monuments (England), and recommending the appointment of the Society as the advisory authority for England and Wales in all matters relating to the furniture, fabric, and monuments of churches.

Mr. P. M. Johnston, F.S.A. (Surrey), moved as a rider to the Council's resolution, that the Congress, recognising the importance of local knowledge and influence, approve the steps already taken by the Sussex Archaeological Society in setting up a special committee to watch over the ecclesiastical antiquities of the county, to warn the Bishop of any threatened mischief to an ancient church, and to tend advice where a faculty was applied for in the Diocese of Chichester. Further, he asked the congress to commend that arrangement to the consideration of other local archaeological societies for imitation where circumstances allowed, such local action to be supplemented to the general powers sought to be obtained for the Society of Antiquaries.

Mr. Johnston's rider was ultimately carried. It is interesting to learn that a similar movement is on foot in France. A petition signed by hundreds of names prominent in literary, learned, artistic, and ecclesiastical circles was presented to the Chamber of Deputies June demanding the safeguarding by the State of the architectural features of the churches of France, and referred to a committee for consideration.

THE BUILDING TRADE.

THE CLERK OF WORKS.

WHAT is a clerk of works? What are the qualifications necessary to justify a man in calling himself a clerk of works? Is it training, experience, knowledge of the science of building—or a combination of these and something else—anything something else? We all know what a clerk of works should be and what general qualifications are, but how to assess them? Like the Constitution, they are unwritten.

The Duties of a Clerk of Works.

What are his duties? In this we think will be found the key to the difficulty! His duties! For, under any architect, committee, or employer his duties vary, or rather the details of his duties vary. Broadly described, his work consists of supervision, the extent and nature of supervision depends upon who he is working for, or under. It may consist of the supervision of the material of the building work, begins and ends in seeing that the proper materials are used and drawings adhered to; but often, very often, it goes much farther than this, to the extent, in fact, of only half his time being devoted to this end. We may take it for granted that the clerk of works, as we now know him, was instituted at the period when free competition amongst the building contractors became general, and that he was appointed as the inspector, or policeman, of the building, and that his duties then, as sometimes now, consisted in seeing that the work was correctly executed.

We know he existed long before that period, in a different capacity; and slowly but surely in the present period he is evolving, and again he is assuming a capacity in which his duties much more responsible than those of an inspector or policeman. Many of the busy architects know what is meant, how many of them could describe or list all the duties of the men referred to? How many grasp, or appreciate, the extent of these duties?

How, but very surely, as the competitive system has increased in the building trade, and order and system have been obliterated from chaos, duty after duty has been added to the clerk of works, until to-day one asks the question—Where do his responsibilities commence, and where do they end? How much of his work now consists of building inspection and how much of it is office work? Organising, advising, checking, correcting, making notes, estimating, valuation, and correspondence.

The duties of a clerk of works consist of serving loyalty to his architect!

There is there to take from the shoulders of the architect every duty and every responsibility that can with confidence be transferred to him. He is the architect's representative, "the eyes of the architect," as has been elsewhere stated. Just to the extent that he commands his confidence will his duties extend from that of being merely the inspector.

Therefore, as the question becomes dependent upon individuals, the answer must likewise vary according to the variation of the individuals, and no set statement of the duties of a clerk of works can be given in all.

Such, we think, is a fair statement of the position of the clerk of works to-day, leaving out of account the appointment that is sometimes made, independently of the architect.

The Training of the Clerk of Works.

What is the training that is necessary to produce a clerk of works to meet the present requirements? If we trace back the

history of most of the present-day men we shall find that they were joiners; men who showed skill and intelligence above the ordinary, who won the notice of their employers and were made foreman joiners; and at a later date were entrusted with the execution of some large building in the capacity of general foreman, and so came into direct contact with the architect. They afterwards pass into the architect's service, or by his influence secure an appointment on some new public building, and so begin their careers as clerks of works.

It is a big stride from foreman to clerk of works, but as a rule they were able to take it and to successfully take up the duties of the post, which are not very dissimilar to those they have been previously exercising so long as the new position is that only of an inspector.

They had all the knowledge of materials and love for good work necessary to make an inspector, but the qualifications necessary to develop them from inspectors to clerks of works, of the type we have endeavoured to describe, have been the slow accumulations of years of experience and effort. Their first promotion to be foreman joiners showed them to be men of superior skill and intelligence and men who could show others how to do their work and were naturally looked to by them for guidance and assistance; so on the strength of their first promotion it is acknowledged that they are men superior to their fellows, and their further development is a matter of course.

So we have got our best type of the old clerk of works to-day in the promoted foreman, and the architects are able to rely on him for advice and assistance, and are in many cases glad to be able to transfer to him responsibilities, in addition to and of considerably more importance than merely inspecting the building work. But he got his first promotion to the post of foreman in past years for very different qualifications than those which now obtain.

The Future Clerk of Works.

We have endeavoured to show that it was the builder who first selected the man who became a clerk of works, and have emphasized the fact that it was due to his superior manual skill at his trade, and his general display of intelligence, that caused the builder to select him. The experienced clerk of works will agree with us that the tendency of to-day is no longer to promote a man to the post of foreman because of his superior skill. He is no longer, to the same extent, looked to by his fellow-workmen in the sense of his being a superior mechanic. It is, in fact, questionable if the display of superior workmanship does not, in some instances, militate against the selection of a workman for the post of foreman.

To-day he is more often selected for his qualifications as a dividend earner, a handler of men in the sense of getting the largest quantity of work out of them in the shortest possible time.

We carefully avoid making a sweeping statement of this and have purposely qualified it throughout, but in support of our contention we will quote the most authoritative opinion we can find in giving a description of the ideal foreman of to-day. It is found on page 91, *The Builder*, dated January 26, 1907. The President at the Annual Dinner of the Builders' Foremen's Association, quoting a former President, says: "The ideal foreman is he who, when a job is taken at 10 per cent. below cost, can bring it out at a 10 per cent. profit." Where, then, is the future clerk of works to come from?

Is the old system of promotion to foreman joiner, general foreman, clerk of works, to continue, and, if so, with what results?

The first and most important duty of either an inspector or a clerk of works is to obtain the best possible work both in materials and workmanship. Is the present-day foreman selected and trained so that he will give the architects satisfaction in these respects? Who is to fill the places of the old clerks of works, as they in the natural course of events die out? Is it to be the foreman whose sole qualifications depend on his power of "speeding up"? Because very soon there will be none other.

The trend of the times demands it. Contractors to obtain an existence, as such, must have it. The competition of to-day spells ruin to any firm of contractors who does not accept this as the main qualification, the one essential qualification, in their foreman. The more he is able to demonstrate the possession of this qualification the speedier will be his promotion, until eventually the whole of the general foremen will be of this type. These are the men who in future will meet the architects and be made into clerks of works if the present method of selection continues.

Are the architects satisfied with this prospect? Whether they discuss it now or at some future date is immaterial. It will have to be discussed or the quality of their buildings will suffer. Is it not already suffering?

What do the clerks of works themselves say about it?

Their ranks are open to every newcomer, good, bad, and indifferent. Tinker or tailor, never mind what his qualifications are, so long as he has obtained sufficient influence to be pitchforked into an appointment as clerk of works, and has as a result obtained two testimonials from the same source, he is open to enter into competition with any clerk of works for any public appointment as such. They are the least protected body of men in the country to-day.

Questions and an Appeal.

How far is contracting removed from a lottery when the efficiency of the direct supervision is so open to chance? How much do the building owners lose by "variations on contract" under similar conditions? What ratio does the salary of a good clerk of works bear in proportion to the later cost of the maintenance of a building supervised by one of this type?

What will be the ultimate effect on the skill of our artisans under the increasing "hustling" conditions, if inefficient supervision is ultimately to predominate?

Of what use are the architect's hours, spent in developing his art in detail and design, if the man supervising the execution of the building has neither love for good work nor the ability to recognise it?

What will the working life of the architect be, if the present progress is maintained in the adoption of new methods of construction and invention without the aid of efficient supervision from the practical side?

And further, what is the salary of an efficient clerk of works going to descend to, so long as the ranks are open to all-comers?

The grand old science of building was something more than the means of merely earning a livelihood. Are we to stand idly by and see its best traditions depart and its degeneration into no higher ideal than that of mere money-making?

Are our future buildings to be faithful efforts to continue the true spirit of the higher development of mankind, or are they to be monuments perpetuating the lower commercial instincts of the period? Without the aid of the architects, the position of the clerks of works appears to be abortive.

The helping hand of the professional established organisation needs to be extended

signs of Mr. J. W. Wilson, architect, of London. The contractors for the work are Messrs. T. Reynoldson & Sons, of Dupton.

BUILDING IN AUSTRALIA.

Advice recently received by the last Australian mail states that the current prices of bricks in New South Wales are regarded by builders as excessive, and in reply to numerous requests the Minister of Public Works states that unless these prices are materially reduced before the beginning of the next year bricks will be sold to the public from the State works now being erected "at prices that will astonish the trade generally." The Department of Defence proposes to build workmen's cottages at the Small Arms Factory at an estimated cost of 50,000l.

The Victoria Public Works Department is preparing plans for the erection of a new Court house in North Melbourne.

UNIVERSITY COLLEGE, BANGOR.

This building was opened last week by H.M. the King, and has been erected at a cost of over 100,000l. The architect for the work was Mr. H. T. Hare, F.R.I.B.A., whose designs for the college were published in the *Builder* on January 12, 1907.

COTTAGE HOSPITAL, HAYWARD'S HEATH.

This hospital is being erected as a memorial to King Edward VII., and the foundation-stone was laid last week. Messrs. Frederick Wheeler & Godman, of Horsham, are the architects, and the contract is being carried out by Mr. Horace Finch, of Hayward's Heath.

NEW DRILL-HALL, MOSLEY.

The foundation-stone of this building was laid last week by the Mayor, and the architect for the building is Mr. W. Cooper, F.R.I.B.A., of Huddersfield. The contractors for the various works are:—Excavating, draining, brickwork, and mason's work, Messrs. Shuttleworth Bros.; joiner, Mr. I. Hayrack; plumber, Mr. T. Boyd; plasterers, Messrs. S. Johnson & Sons; slater, Mr. E. Wild; concreters, Messrs. Luttrellworth Bros.; painter, Mr. T. Boyd; electricians, the Lancashire Electrical Engineering Company, Ltd.

NEW BANE, BALLYCONNEL.

This building has been erected by Messrs. McDowell & Co., contractors, of Belfast, on the designs of Messrs. Blackwood & Jury, architects, of Belfast, and the contractor for the office work was Mr. M. A. Mitchell.

THE NEW WHITEHALL CLUB.

The New Whitehall Club is being erected on the west side of Princes-street, Westminster, the corner of Parker-street. The club has a frontage of 63 ft. to Princes-street, and a depth of 52 ft. to Parker-street. The ground upon which it is raised is at street level, and contains a good entrance hall, a morning-room, audience-room, and the secretary's office and committee-room, and also a commodious cloakroom with lavatories attached. On the east side the dining-room extends for the full length of the building, and is served from service-rooms with lifts on the west side of the same. Library and reading-room are provided to the Parker-street front on this floor. On the second floor, over the dining-room, is the large smoking-room with cardrooms adjoining, while the third floor are a large billiard-room and lounge, and also a private billiard-room for the use of members only. The kitchen is situated in the basement, and has been carefully planned for the service of a large club. The premises are constructed in fireproof materials throughout, and are heated with low-pressure hot water and open fireplaces. An electric passenger lift serves all floors. The elevators have been kept simple in character, and are being carried out in red pressed brickwork with Portland stone dressings. The builders carrying out the works are Messrs. Ford & Walton, Ltd., and the architect is Mr. Hatfield Clarke, F.R.I.B.A., of Bishopsgate.

NEW COUNTY ASYLUM ANNEX, WHITTINGHAM.

The contract for this work has been secured by Messrs. E. Taylor & Co., builders, of Littleborough, the amount of the tender being £7,550l. The architects are Messrs. Sykes & Evans, of Manchester and Rochdale.

OPHTHALMIC HOSPITAL, LONDON.

The foundation-stone of this building, which is being erected in Judd-street, St. Pancras, was laid on July 5 by the Duchess of Albany. The contractors for the work are Messrs. Paton & Fotheringham, Ltd., of Theobald's-road, E.C., and the architect is Mr. John Ladds.

TRADE NEWS.

The Royal College of Science, Dublin, which was recently opened by H.M. the King, is warmed throughout by radiators with low-pressure steam or vapour as the heating medium, circulated at atmospheric pressure by means of special vacuum pumps. These pumps withdraw all air and condensed water from the system and promote a positive circulation at all points without any risk of "water-

hammer" or "knocking." Fresh air is introduced into the rooms by means of grates fixed in the walls behind the radiators, and each air inlet and radiator can be separately controlled by the occupant of the room. The vitiated air from the rooms is extracted by means of outlets near the ceilings, and these open into ducts over the corridors, which are connected to two chambers on the roof. In each chamber a large and powerful fan of the centrifugal type is fixed, driven by an electric motor, and these fans deliver the air to the outside atmosphere. All the fumes from the apparatus in the laboratories, etc., are collected into flues and ducts and taken separately to the fan chambers. The hot water is generated by means of large central copper storage calorifiers heated by steam fixed close to main boiler-house, from which copper circulations are taken to the whole of the laboratories, and the circulation of the water can, when desired, be accelerated by steam-driven pumps. A service of high-pressure steam piping is also run throughout the building for experimental purposes. The steam for this plant is supplied from the existing power station, which is being extended by the addition of another boiler of the locomotive type similar to the present ones. The whole of the engineering equipment has been designed and erected by the Brightside Foundry and Engineering Company, Ltd., of Sheffield, London, and Birmingham.

Messrs. Jones & Attwood, Ltd., heating specialists, engineers, and ironfounders, Stourbridge, have purchased the business carried on for the past eight years by Messrs. Birch Killon & Co., hydraulic engineers, Cooper-street, Manchester. The staff has been transferred from Manchester to Messrs. Jones & Attwood's works at Stourbridge, and all business will in future be transacted from that address. Mr. H. Birch Killon, A.M.Inst.C.E., has been appointed Manager of the Municipal Department, and consulting engineer on all questions relating to sewerage, sewage disposal, and hydraulic machinery.

In the Royal Liver Building, Liverpool, which has just been opened, there are fifteen passenger lifts arranged for a load up to 1,800 lb. Four of these travel at a speed of 300 ft. per minute, the height of travel being 148 ft., the lifts serving eleven floors. Six express lifts which run at a speed of 400 ft. per minute serve seven floors. Two express lifts, running at 400 ft. per minute, serve three floors. Two express lifts, travelling at a height of 165 ft. at a speed of 400 ft. per minute, serve three and four floors respectively, and one lift, travelling at a height of 208 ft. at a speed of 400 ft. per minute, serves six floors. These lifts are arranged in batteries similar to those in large buildings in America. There are also two goods lifts, each of which is arranged for a load of 1 ton at a speed of 150 ft. per minute, travelling 165 ft. These lifts are also operated by electric control with car switch. Special interlocking gear is fitted to all doors, both for passenger and goods lifts, to prevent any door being opened unless the cage is opposite the same, and to prevent the lift being started unless all the doors are properly closed. This installation has been executed by Messrs. R. Wiggall & Co., Ltd. In our issue of April 9, 1910, illustrations of the Royal Liver Building appeared. The architect was Mr. W. Aubrey Thomas.

The Cherry Tree Machine Company, Ltd., laundry engineers, Blackburn, have been instructed by the Guardians of Elham Union to supply one of their foul-linen washing machines to the Elham Union Workhouse, Lyminge, Folkestone.

Under the direction of Mr. W. A. H. Masters, F.R.I.B.A., Swindon, Boyle's latest patent "air-pump" ventilators have been supplied to St. Luke's Church, Swindon.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to the Wesleyan Church, St. John's Chapel, Durham.

Messrs. E. H. Shorland & Brother, Ltd., of Failswork, Manchester, have recently supplied some of their warm-air ventilating patent Manchester grates to the Royal Berks Hospital, Reading.

The new church schools, Workop, are being ventilated by means of Shorland's patent exhaust roof ventilators supplied by Messrs. E. H. Shorland & Brother, Ltd.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with (the names of the applicants are given in parentheses).

Lines of Frontage and Projections.

Bow and Bromley.—One-story building at the premises of Spratt's Fatens Ltd., on the eastern side of Morris-road, Poplar (Messrs. Max Clarke & Garbutt for Spratt's Patent, Ltd.).—Consent.

Kensington, South.—One-story addition in front of the main flank wall of No. 11, Queen's-gate terrace, Kensington, to abut upon Gore-street (Mr. F. E. Williams).—Consent.

Lewisham.—Porches to two houses on the eastern side of Dukethorpe-road, Lewisham (Messrs. Edmonds, Ltd.).—Consent.

Lewisham.—Erection of buildings on the southern side of Ferryvale, Lewisham (Messrs. Norfolk & Prior for Messrs. Gosling Brothers).—Consent.

Norwood.—Erection of buildings upon the site of Nos. 125, 130, and 135, Norwood-road, Norwood (Mr. A. R. Westworth).—Consent.

Paddington.—Projecting porch in front of St. Mary's Hospital, on the south-western side of Cambridge-place, Paddington (Mr. C. W. Ferrier).—Consent.

Paddington, South.—Oriol window in front of No. 124, Inverness-terrace, Paddington (Mr. A. Bird).—Consent.

Stepney.—Projecting porch at the Raines Foundation schools, on the eastern side of Arbour-square, Stepney (Mr. H. O. Ellis).—Consent. Wooden cornice in front of the Raines Foundation schools, on the eastern side of Arbour-square, Stepney (Mr. H. O. Ellis).—Refused.

Strand.—Projecting illuminated sign in front of No. 171, Strand (Income Tax Adjustment Agency, Ltd.).—Consent.

Wandsworth.—Hoarding at No. 213, Balham High-road, Wandsworth (Mr. J. A. Markillie).—Refused.

Width of Way.

Rotherhithe.—Erection of a building, to be inhabited by persons of the working class, upon the site of No. 23, Parish-street, Bermondsey (Mr. R. Page).—Consent.

Width of Way and Line of Frontage.

Greenwich.—Erection of buildings on the northern side of Tuskar-street, the northern, eastern, and western sides of Woodland-place, the eastern side of Creed-place, the southern side of Trafalgar-road, the eastern and western sides of Fenton-street, and the western side of Miles-street, Greenwich (Mr. A. Griffin).—Consent.

Width of Way, Line of Frontage, and Construction.

Woolwich.—Iron and glass shelter in front of Nos. 123 and 130, Powis-street, Woolwich (Mr. E. S. Barr for the Premier Electric Theatres, Ltd.).—Refused.

Lines of Frontage and Construction.

Dulwich.—Iron roof over a portion of the forecourt at the bank of No. 117, Lordship-lane, Dulwich, abutting upon Shawbury-road (Mr. W. Morton).—Consent.

Hackney, Central.—Coffee-stall of a temporary character in front of No. 345, Kingsland-road, Hackney (Mr. W. J. Jordan).—Consent.

Holborn.—Iron and glass shelter at the Hart-street entrance to the Kingsley Hotel, Bloomsbury (Mr. J. Truslove).—Consent.

Islington, East.—Temporary iron and glass conservatory at the rear of No. 33, Holloway-road, Islington, abutting upon Loraine-road (Messrs. Jones Brothers (Holloway), Ltd.).—Consent.

Lewisham.—Showcases and notice-boards of a temporary character in front of No. 223, Lewisham High-street (Messrs. Norfolk & Prior).—Consent.

St. George, Hanover-square.—Iron and glass shelter at the entrance to the Victoria Palace, Victoria-street, Westminster (Messrs. F. Matcham & Co.).—Consent.

St. Pancras, South.—Two wooden stalls in front of King's Cross (Metropolitan Railway) Station, Pentonville-road, St. Pancras (Mr. A. C. H. Watkin).—Consent.

Wandsworth.—Wood and glass roof at the bank of No. 135, Micham-road, Wandsworth (Mr. J. R. Bex).—Refused.

Wandsworth.—Temporary wood and iron building in front of Nos. 256 and 258, Micham-road, Tooting (Messrs. Nowell, Parr, & Kates).—Consent.

Lines of Frontage and Spaces at Rear.

Hackney, North.—Erection of a building to be used as a synagogue at the rear of Nos. 124 and 126, Green-lane, Hackney, next to Burma-road (Mr. S. Clifford Teal).—Consent.

St. Pancras, South.—Erection of buildings on the southern side of Compton-street, St. Pancras, to abut also upon the eastern side of Kenton-street (Mr. A. Davis for the London Housing Society, Ltd.).—Consent.

Line of Frontage, Spaces at Rear, and Projections.

Marylebone, East.—Additions at No. 2, Wellington-road, St. John's Wood (Mr. S. J. Wright for Mrs. E. Wright).—Consent.

Frontage and Deviation from Certified Plans.

Westminster.—Oriel window in front of a proposed building on the eastern side of Tufon-street, Westminster (Messrs. A. E. Hughes & Son for "Mr. Fegan's Homes,"—Refused.

Formation of Streets.

Battersea.—Two new streets for carriage traffic on the Battersea-rise House Estate, Clapham Common (Mr. A. Wellings).—Consent.

Hampstead.—New street for carriage traffic to lead from Ornan-road to Belsize-lane, Hampstead (Messrs. W. Woodward & Sons for Mr. A. Ridley Bax).—Consent.

Hampstead.—Erection of buildings upon a site at the rear of Cavendish-mansions, on the southern side of Mill-lane, Hampstead (Mr. J. D. Hunter).—Consent.

Holborn.—New street for foot traffic only in connexion with the erection of buildings upon the site of Fulwood's Rents, Holborn (Mr. H. J. Leaning).—Consent.

Building for the Supply of Electricity.

Strand.—Alterations at the electricity sub-station, Mason's-yard, Duke-street, St. James (Mr. C. Stanley Peach for the St. James and Pall Mall Electric Light Company, Ltd.).—Consent.

Deviation from Certified Plans and Uniting of Buildings.

St. George, Hanover-square.—Re-erection of No. 24, Conduit-street, St. George, Hanover-square, and formation of openings in the party wall between Nos. 24 and 25, Conduit-street, at the basement, ground, first, second, third, and fourth floor levels (Mr. A. Blomfield Jackson).—Consent.

Cubical Extent.

City of London.—Erection of a building upon the site of Nos. 22 to 25, Farringdon-street (Mr. H. O. Ellis for the Amalgamated Press, Ltd.).—Consent.

Uniting of Buildings.

City of London.—Uniting of No. 23, Coleman-street with the Wool Exchange, City, at the ground-floor level (Mr. E. K. Purchase).—Consent.

Fulham.—Openings in the party walls between Nos. 50, 52, and 54, Dawes-street, Fulham, at the basement and ground-floor levels (Mr. W. T. H. Woolcock for Mr. E. Speis).—Consent.

Kensington, North.—Opening in the party wall at the ground-floor level between Nos. 95 and 97, St. Mark's-road, Kensington (Mr. G. H. Solihott).—Consent.

Westminster.—Three openings in the party wall at the basement and ground-floor levels between Nos. 12 and 16, Ashley-place, Westminster (Mr. S. Newcombe for Messrs. A. J. Thompson & Co.).—Consent.

Width of Way and Projections.

City of London.—Erection of a building on the southern side of Lombard-street, City, westward of Clements-lane, at less than the prescribed distance from the centre of the roadway of Lombard-street, and with an oriel window, a hood, and balconies (Messrs. Gordon & Gunton for the Royal Insurance Company, Ltd.).—Consent.

Hackney, Central.—Erection of a building on the southern side of Clarence-place, Hackney, with a boundary wall at less than the prescribed distance from the centre of the roadway of Clarence-mews, and with projecting eaves (Mr. S. Towse for the Viking Bennett Company, Ltd.).—Consent.

Width of Way, Lines of Frontage, Projections, and Construction of Buildings.

St. George, Hanover-square.—Two showcases and a sign at No. 38, Dover-street, Piccadilly (Messrs. J. Barker & Co., Ltd.).—Refused.

Space at Rear and Projections.

Kensington, North.—No. 40, Barbly-road, Kensington, with an irregular open space at the rear, with a bay window in front and with a pent roof over the entrance (Mr. A. Haley).—Consent.

St. Pancras, South.—Erection of a block of working-class dwellings on the northern side of Compton-street, St. Pancras (Mr. A. Davis for the London Housing Society, Ltd.).—Consent.

Deviation from Certified Plans.

Marylebone, East.—Erection of No. 29, Harley-street, St. Marylebone (Mr. S. J. Tatchell for Mr. C. E. Pezzenik).—Consent.

Working-Class Dwellings.

Hampstead.—Erection of three buildings (Messrs. Farebrothers, Ellis, & Co.).—Consent.

Kensington, North.—Dwelling-house intended to be inhabited by persons of the working class at the premises of the London Parcels Delivery Company, Ltd. (Mr. W. E. Trent).—Consent.

Kensington, North.—Dwelling-house intended to be inhabited by persons of the working class at the premises of the Pall Mall Deposit Company, Ltd. (Mr. W. G. Hunt).—Consent.

*The recommendations marked * are contrary to the views of the metropolitan borough councils concerned.*

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

BANBURY.—Additions to factory for Messrs. Henry Stone & Son, Ltd.

Bangor (North Wales).—Workhouse infirmary; Mr. F. Bellis, architect, Bangor.

Barnsley.—Works for Messrs. Wood Bros., glass manufacturers.

Beddington.—School, Sandy-lane; Messrs. Jarvis & Richards, architects, 10, Queen Anne's-gate, S.W.

Birkenhead.—School, Temple-road; Mr. R. T. Jones, Secretary, Education Committee, Birkenhead Town Council.

Birmingham.—Rope factory; Messrs. R. Fenwick, Ltd., builders, William Edward-street, Birmingham.

Blackburn.—Additions to school, Shear Brow; Trustees, Four-Lane Ends School.

Extensions to Town Hall; Architect, Blackburn Town Council.

Bognor.—Twelve houses, Sheepwash-lane; Mr. O. A. Bridges, Surveyor, Bognor Urban District Council.

Bridlington.—Parish hall (2,500 l.); Churchwardens, Christ Church, Bridlington.

Bury.—Enlargement of St. Chad's School; the Managers.

Caerphilly.—School (5,000 l.); Mr. A. O. Harpur, Surveyor, Caerphilly Urban District Council.

Cambourne.—Alterations to Wesley Chapel (1,000 l.); the Pastor.

Cardonald.—House, Hillhead-road; Residential Properties, Ltd., 139, St. Vincent-street, Glasgow.

Cathcart (Glasgow).—Six tenements, Tulloch-street and Rannoch-street; Messrs. Geo. Eadie & Sons, builders, 405, Mathieson-street, Glasgow.

Catterick.—Chapel; Mr. H. Howarth, architect, Darlington.

Cefn Coed.—Asylum; Mr. G. T. Hine, 35, Parliament street, S.W.

Chadsmoor.—Primitive Methodist Church (1,500 l.); Messrs. Jeffries & Shipley, architects, Walsall; Messrs. R. Speake & Son, builders, 76, Stafford-street, Wolverhampton.

Cilfrew.—School (160 places); Architect, care of the North Group of School Managers.

Clyd (North).—School; Messrs. W. & J. R. Watson, Ltd., builders, Neath, Glam.

Coton End.—Additions to school (100 extra places); Mr. Bolton King, Secretary, Education Committee, Warwickshire County Council, Warwick.

Coventry.—Factory, Little Park-street; Messrs. G. & T. Steane, architects, Little Park-street, Coventry. School; Mr. H. Streather, builder, Four Oaks, near Birmingham.

Crossroads.—School (250 places) for the Five Catholic Education Board.

Crowle and Hoo Brooks.—Schools; Mr. A. Rowe, architect, Foregate, Worcester.

Darlington.—Proposed church and Sunday-school; Trustees, Primitive Methodist Church, Eastbourne.

Darnley (Lanes).—Nurses' Home; Mr. R. Kay, builder, Burny-road, Rochdale.

Dolgelley.—Drill-hall (1,000 l.); Mr. R. W. Davies, architect, Carmo, Mont; Mr. John W. Owen, builder, Dolgelley.

Dunstable (Beds).—Theatre (5,000 l.); Luton Dramatic Syndicate.

Edinburgh.—Hall (500 places); Trustees of Mr. John Hope. College (50,000 l.); Board of Management, Royal (Dick) Veterinary College.

Elderslie (Glasgow).—Store, Beith-road, for the Johnstone Co-operative Society, Ltd.

Farleas, N.E.—Enlargement of school; Messrs. Fryers & Penman, architects, Largo.

Gillingham.—Electricity sub-station, Barnsole-road; Mr. A. D. Chalmers, Electrical Engineer, Gillingham Town Council.

Goldenhill.—School (4,600 l.); Mr. P. Pemberton, builder, Tunstall, Staffs.

Goodrich.—Cottage hospital; Mr. A. O. Harpur, Surveyor, Caerphilly Urban District Council.

Halifax.—Conversion of Northgate Hall into cinematograph theatre for the National Electric Picture Company.

Harrington.—Improvements to Lowsea School (1,170 l.); Mr. Harrison Killip, builder, Harrington.

Hellingly (East Sussex).—School (1,640 l.); Messrs. Peckett & Co., builders, Crawley.

Hempstead (Kent).—Extensions to school (1,700 l.); Messrs. Gates & Sons, builders, Frindsbury.

* See also our list of Competitions, Contracts, etc., on another page.

Haywood.—School (800 places), Harwood Park site; Mr. W. A. Heywood, Secretary, Education Committee, Haywood Town Council.

Hull.—Additions to works, St. Paul's-street, for the Hull Forge Company, Ltd., Hull.

Kimberworth (Yorks).—Smallpox hospital (5,000 l.); Messrs. C. Green & Sons, builders, 172, Wellgate, Rochesterham.

King's Langley (Herts).—Infants' school; Mr. A. R. S. Halliday, Secretary, Education Committee, Herts County Council, Hertford.

Lambourn (Warwick).—Sanatorium; Mr. J. Bowen, Surveyor, Reading Town Council.

Landlad.—Additions to public school for the Kirkintilloch School Board.

Lapworth (Warwickshire).—Villas; Mr. Birkett J. Emery, architect, 109, Colmore-row, Birmingham.

Leamington.—Territorial headquarters; Mr. F. Trepess, architect, Warwick; Mr. T. Gathercole, builder, Clarendon-avenue, Leamington. Residence; Mr. F. Smith, builder, Milverton, Leamington.

Llanwrtyd Wells.—Four houses (1,010 l.); Messrs. A. Swash & Son, architects, Llanidrod; Mr. N. Evans, builder, Llanwrtyd Wells.

Lowestoft.—The following plans have been passed:—Motor garage, London-road South, for Mr. F. Waldron; eight houses, Barton-street and Winnipeg-road, for Mr. Geo. Ansell; motor garage, Yarmouth-road, for Mr. J. W. Brook.

Lytham.—Steam laundry, Rutland-road, for the Ansell and Fairhaven Laundry.

Maesmaroch (Glam).—School; Messrs. W. & J. R. Watson, Ltd., builders, Neath.

Milton.—School (2,000 l.); Messrs. Settle & Bantall, architects, Ulverston.

Milton.—School (5,700 l.); Messrs. J. Moss & Son, builders, Milton.

Montacute (Somerset).—Ten houses; Mr. R. W. Burnell, Surveyor, Yeovil Rural District Council.

Muirhead.—School; Messrs. Thoms & Wilkes, architects, 46, Reform-street, Dundee.

Newcastle-on-Tyne.—Sluic, Hambrug Wharf (3,800 l.); Messrs. Wright, Anderson, & Co., builders.

Norwich.—Extensions to mill for the Tenterhouse Bleaching Company.

Norwich.—New Council offices; Mr. A. Collins, engineer, Guildhall, Norwich. House at lunatic asylum (500 l.); Messrs. John Hurn & Sons, builders, Survey-street, Norwich.

Nottingham.—Cemetery chapel, etc. (8,000 l.); Mr. F. E. Lewis, architect, Guildhall, Nottingham.

Nuneaton.—Villas, Manor Park; Messrs. Mayo & Son, architects, Bridge-street, Nuneaton. Liberal club; Mr. F. Hingley, architect, The Square, Nuneaton. Mr. Harria, builder, Attleborough, Nuneaton.

Oswestry.—Almshouses; Mr. G. W. Loay, Surveyor, Oswestry Town Council.

Pixmore (Leitchworth Garden City).—School (4,500 l.); Mr. V. A. Smith, County Surveyor, Herts County Council, Hatfield.

Ratrick.—Church of St. John (5,000 l.); Sir Chas. Nicholson, architect, 2, New-square, E.C.

Slacks-hill.—Enlargement of school (160 extra places); Mr. G. Balfour, Secretary, Education Committee, Staffs County Council, Stafford.

Southam.—School (250 places); Mr. B. King, Secretary, Education Committee, Warwickshire County Council, Warwick.

Southampton.—Enlargement of Portsmouth Depot; Mr. J. A. Crowther, Borough Engineer, Southampton Town Council. The following plans have been passed:—Rebuilding, "Black Horse," Orchard-lane, for Messrs. Weston & Burnett; additions, the Sailors' Home, Oxford street, for Messrs. Mitchell, Son, & Gutteridge, seven houses, Wilton avenue, for Mr. W. Waeeler, nine houses, Newcombe-road, for Mr. W. B. Hill; three houses and stores, Hill-lane, Janson-road, and Shirley-road, for Messrs. Jurd & Sanders; additions, the Yacht Laundry, Lake-road, for Mr. S. Tobbutt; sixteen houses, Shirley avenue, for Mr. F. Lowe; twelve houses, St. James' Park-road, for Mr. F. W. Young, jun.; additions, Sunlight Laundry, Winchester-road, for Mr. G. R. Long; ten houses, Newcombe-road, for Mr. F. J. Paul; motor garage, 247, Millbrook road, for Messrs. Smith & Moore. Plans have been lodged for four houses, etc. Victor-street, for Mr. C. Moody.

Stoneyfield (Hull).—Extensions to works for the Premier Oil Extracting Company.

Swynodry.—Houses for the Summerhill Building Club.

Walsall.—School; Messrs. Hickton & Farmer, architects, Bridge-street, Walsall; Mr. W. Winstanley, builder, Sandwell-street, Walsall.

Waltham Cross (Herts).—School (4,800 l.); Mr. V. County Surveyor, Herts County Council, Hertford.

Walton-le-Dale.—Conservative club-house, Chorley-road; Mr. A. C. M. Lillie, architect, Bamber Bridge.

Whitley Bay.—Cemetery buildings; Messrs. Oliver, Leeson, & Son, architects, Milburn House, Newcastle-on-Tyne.

the London Building Act, although a wall might be a party wall for part of its length, this could never be the case for part of its height.

Sect. 58 of the London Building Act, 1894, provides that "In either of the following cases—(a) where a wall is after the commencement of this Act built as a party wall in any part; or (b) where a wall built before or after the commencement of this Act becomes after the commencement of this Act a party wall in any part; the wall shall be deemed a party wall for such part of its length as is so used." On the other hand, by sect. 5, subsect. 16, a "party wall" is defined as "(a) a wall forming part of a building and used, or constructed to be used, for separation of adjoining buildings belonging to different owners or occupied or constructed or adapted to be occupied by different persons."

The Divisional Court experienced some difficulty in interpreting these sections, but affirmed the decision of the County Court judge, and held that the effect of the two sections was to render a wall a party wall for that portion of its height or length which was used for the separation of adjoining buildings.

The second decision, in the case of *Minturn v. Barry*, we have already noted, the *Builder*, April 14, but, the case being now more fully reported, a word or two may be said upon the decision. It now appears that the party wall in question was originally a garden wall, which had subsequently by user become the party wall of a house. As such it let through the damp, and one of the owners served a party notice proposing to enter the adjoining premises and to insert a damp course. The matter was referred under the Act to arbitration, and the surveyors appear to have adopted the view that if the wall was structurally strong enough to bear the weight imposed upon it it could not be deemed defective or out of repair within sect. 38 of the Act. The County Court judge practically took the same view, holding that no degree of dampness could make the wall defective. The Divisional Court held this decision to be a sufficient degree would make a party wall "defective," and that the condition of the wall must be ascertained by the County Court judge.

LAW REPORTS.

(Before the OFFICIAL REFEREE, Mr. Muir-Mackenzie.)

Action by Contractor against Building Owner.

Minter v. Waldstein.

THE hearing of this case was continued last week, it being an action brought by Mr. F. G. Minter, a contractor, against Mr. Charles Waldstein, Professor of Art at Cambridge University, from whom he claimed 2,750*l.*, the amount payable in respect of a certificate of Mr. Frederick William Foster, an architect, and in respect of a contract made between plaintiff and defendant for the carrying out of alterations and additions at Newton Hall, near Harston. Defendant alleged that the work was defective, and counterclaimed against the plaintiff for 10,000*l.* damages.

Mr. Frederick George Minter, the plaintiff, declared that up to the middle of January, 1911, when Mr. Waldstein refused to pay under the certificate, he had never had any suggestions made to him of bad workmanship in this building. He asked for the defects to be specified. There was nothing which he would have objected to put right had he been called upon to do so.

In cross-examination by Mr. Clavell Salter, K.C., for the defendant, Mr. Minter said that, assuming he were the owner of this house and desired to put these cracks right, he would call the workmen in, and in about three weeks' time everything would be all right. He maintained that he had carried out all his instructions.

Evidence was given by Mr. Frederick Gunnell, manager of the joinery department, employed by the plaintiffs at the Ferry Works at Putney. He deposed that the joinery sent to Newton Hall was satisfactory, and of the best London make.

Cross-examined by Mr. Clavell Salter, the witness agreed that if in a building one found a floor sagging, the plaster partitions cracking, and the joinery opening, the cracks and the openings would probably be caused by the sagging of the floor. Witness was of opinion that the sagging of the floor of one of the bedrooms of Newton Hall had stopped, because he had examined the ceiling underneath the floor, and he thought that if any sagging had taken place in the floor above, the ceiling would certainly have shown serious signs of it.

Mr. Salter: I suppose you have spent a good part of your life in preparing joinery for new houses?—Yes; I have spent twenty-eight years.

I suppose the joinery that you provided is mostly, if not altogether, for Mr. Minter's houses?—For Mr. Minter's contracts.

If these floors sagged, and made your joinery open, you would have to about it quickly?—Yes, certainly. Witness added that during the last decade he had executed a quarter of a million pounds of joinery, and he thought that was a pretty fair record.

Suppose that you have built a first-class dwelling-house—everything tip-top. Would you expect the doors of that house when it is completed to require to be planed at the bottom so as to enable them to be opened?—In a new house there is bound to be swelling and shrinkage. Doors have occasionally to be cased on account of the swelling.

Take a well-built house with fifty doors. Ought I to expect to plane the outside of any of the doors?—Not one in twenty.

It would be bad work, would it not, to put your joinery on wet plastering?—It would not certainly be the right thing to do.

Could you make a good job of this without getting the floor level?—Yes.

Mr. William Woodward, F.R.I.B.A., F.S.I., examined by Mr. Lewis Thomas, said he had seen, practised at 13, South Molton-street, Strand, and was the surveyor of the Honourable Artillery Company. He was also a member of the Council of the Royal Institute and a member of the Practice Committee. He said he had made an inspection of this house on June 28. Leaving out the fissures in the plastering partition, the defects were nothing more than what one would expect in a building of this sort.

Mr. Thomas: Irrespective of who is responsible for the cost, are they of the nature that could easily be put right, as provided in the maintenance clause, in the ordinary way?

—That is my decided opinion. May I add that I believe every architect of experience always tells the client not to expend much money in the decorations until the lapse of two or three years, because there are sure to be these evidences of the result of moisture and shrinkages.

Mr. Woodward added that he advised his clients always to put on a cheap wall-paper at first.

In answer to further questions, Mr. Woodward thought that the fissures and the sagging were not due to bad construction. Regarding the plaintiff's suggestion that the house had been overheated, and that that had caused much of the trouble, Mr. Woodward mentioned that he saw two radiators and one fireplace in each comparatively small room.

Mr. Thomas: I am going to put you this hypothetical question: Assuming this building on completion was subjected to the use of these radiators and hot water pipes and fires, consecutively or jointly, what effect would that have on shrinkage?—It would tend to increase, for example, the opening of the mitres.

Continuing his evidence, Mr. Woodward stated that from what he saw he should be assisted as an architect with the spacing out of the floors. He thought the quality of the timber throughout the building very good. The whole of the timber he saw was as free from knots as any other timber he had seen. He also thought it very good timber because of the soundness of its cut, there being no roughness on the surface. He had also detected a fresh smell, which was only observable in first-class timber, whereas in inferior timber there was a mouldy smell. Regarding the shakes, he had never yet seen timber without shakes. Some were dangerous and others were not. He observed no dangerous shakes in this building. As an architect, he certainly could not complain of the quality of the timber.

In cross-examination by Mr. Clavell Salter, Mr. Woodward said that the alterations would not involve the householder leaving the house, although they would involve the temporary removal from rooms where the alterations were being done. He had not made an examination of the house to see how many floors sagged. He had looked beneath the floor for the signs of sagging.

Mr. Salter: May the Court take it that where you have found no crack in the ceiling below you have assumed the floor above has not sagged?—I have not assumed anything of the sort. I assumed that when the floor joists were put in they did, as most joists do, sag. If the floor had continued to sag, it must have cracked, and the plastering of the ceiling would have been affected.

Asked how many of these doors had to be cut at the bottom in order to enable them to be opened, Mr. Woodward replied that, judging from his inspection, he should say very few. It was his opinion that the maintenance clause was to provide against settlements and subsidences. He thought the roof sufficiently strong for its purpose. He was not mistaken in the view that the roof was made of a more acute pitch. The exact opposite was not done, and the roof was not flatter than contemplated. If one regarded it as an angle, it probably was

flatter than 45, but it had increased in height 2 ft.

In the course of further cross examination Mr. Woodward insisted that he frequently found a worse state of things than that at Newton Hall in first-class buildings, where money was no object and first-class builders were employed. With the exception of the prominent cracks in the plastered partition of the first floor, the witness unhesitatingly said this house at Cambridge was a fair average first-class building. In re-examination, he said there was not the least sign of weakness in the ground floors.

The Official Referee asked the witness assuming that the materials and workmanship were in accordance, as he said, with the drawings and specifications, it was suggested that the builder should make good certain defects.

Mr. Woodward: Because we assume that the materials and workmanship are of the best, but we know that these materials and workmanship are subject to these shrinkages and defects in consequence of the weather, dampness, heat, and other things affecting the building.

Evidence was also given on behalf of the plaintiff's case by Mr. Harley Mackenzie, a surveyor and sanitary engineer, who deposed amongst other things, as to sewerage plans, the work at Newton Hall, and by Mr. Leonard Withers Green, an architect. The latter said he was accustomed to the superintendence of building contracts. In connexion with the work at Newton Hall Mr. Foster, the architect, instructed him to act as clerk of alterations, and Mr. Minter was to take instructions. Witness was in constant communication with both Mr. Foster and Mr. Minter. Mr. Waldstein, who gave him instructions from time to time. The plaintiff carried out the alterations and additions in accordance with those instructions approved—as witness always understood—by the architect, who witness had never hesitated to consult.

Mr. Blanco White: You were present from February till November 16. What do you say as to the way the work was carried out? Well, it was carried out very efficiently. Witness added he had never heard Mr. Foster complain of workmanship and materials. Professor Waldstein knew that orders were given for variations.

The case was proceeding when we went press.

Damage by Sewage Flooding.

A CASE of importance to sanitary authorities has recently been decided in the Pontefract County Court.

The plaintiff in the action—Marchant Castleford Urban Council—sued for damages from the flooding of his premises arising from the defendants' sewage on certain specified dates, and also for an injunction restraining defendants from permitting further flooding.

Negligence was alleged under two heads (1) by the wrongful diversion of a sewer in the construction of the original system of sewerage.

For the defence, evidence was given to effect that no sewer diversion had been made by Mr. Paterson, M.Inst.C.E., Bradford engineer for the original scheme of sewerage described the provision made by him for sewage and storm water. This he considered more than ample, and ascribed the cause of flooding to "phenomenal rainfall," for which it was practically impossible to make provision on account of the enormous expense involved. In the course of his evidence Mr. Paterson mentioned the fact that in his own garden about twenty miles from the locus, on one of the specified dates of flooding he had measured a rainfall of $\frac{3}{4}$ in. in thirty minutes, and during shorter periods the intensity of fall much greater.

His Honour Judge Benson delivered judgment at the Pontefract County Court. His judgment was that plaintiff sought to succeed on grounds—(1) negligence by the divergence of sewer about 1890, and (2) negligence of construction of the original system. The onus of proof on plaintiff to prove one or other of these heads plaintiff alleged that some alterations after defendant Council had completed original system they wrongfully diverted sewer connecting Leeds-road with Saville-street, thereby causing damage to plaintiff's premises. The judge found that there had not been such diversion, and the idea that plaintiff thereon was entirely erroneous. As to second allegation of negligence—that the original scheme, carried out about 1870, had negligently constructed the system was very well for many years, and there was indication of any negligence. The growth of the district had made the present capacity

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xvi.; Auction Sales, xxii.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

Competitions.

31. — **Lowestoft.** — **SCHOOL.** — The Education Committee invite designs for an elementary school for 500 boys at Roman-Three premiums are offered: 20, 10, and 5. See advertisement in issue of June 16 for particulars.

32. — **Wellington.** — **NEW PARLIAMENT.** — Premiums of 1,000, 500, 1,000, 10, are offered for the competitive designs from the Architect of Public Works, Wellington, New Zealand.

33. — **IDEAL COUNTRY HOUSE.** — 1000. offered Daily Mail, Carmelite House, E.C., for a country house, to cost from 9000.

34. — **Mr. E. C. P. Monson, F.R.I.B.A.,** and J. S. Sadgrove, F.R.I.B.A., and others, invite designs for a public bath.

35. — **Northwich.** — **PUBLIC BATHS.** — Northwich U.D.C. invite designs for public baths. See advertisement in this issue for further particulars.

36. — **Elmston.** — **LAYING-OUT SCHEME.** — Premiums of 400, and 100, are offered by the U.D.C. for lay-out scheme. Particulars from the Town Surveyor, Elmston.

37. — **Berne.** — **MONUMENT.** — Designs for a monument at Berne to celebrate the foundation of the International Telegraph Union. Conditions may be seen in the library of the Royal Institute of British Architects.

38. — **19-25.** — **ATHENS.** — **COURT OF JUSTICE.** — International competition is instituted by the Ministry of the Interior, for the erection of buildings, to cost 160,000. The Official programme may be seen at the Library of the Ministry.

39. — **Manchester.** — **LIBRARY AND READING ROOMS.** — Limited to the ten selected competitors in the first competition. See issue of June 23, p. 780.

40. — **Holland.** — **STAINED GLASS WINDOWS.** — Designs are invited for a stained glass window to be erected in the University at Utrecht. See advertisement in issue of June 9 for particulars.

41. — **Marylebone.** — **NEW MUNICIPAL BUILDINGS.** — Premiums of 1000, 750, 500. The designs are invited (Alexander Thomson, Architect) for a bridge. See advertisement in issue of July 14 for further particulars.

42. — **City of St. Petersburg.** — **DESIGN FOR A BRIDGE.** — Particulars in our issue of August 13, 1910.

43. — **Glasgow.** — **DESIGN FOR A BRIDGE.** — Designs are invited (Alexander Thomson, Architect) for a bridge. See advertisement in issue of December 24 for further particulars.

44. — **1912.** — **ANSTRALIA.** — **DESIGNS FOR A CAPITAL CITY.** — The Government of the Commonwealth of Australia invite competitive designs for the laying out of this Federal capital. See advertisement in issue of July 7 for particulars.

45. — **Nottingham.** — **BAPTIST CHURCH PREMISES.** — Limited to Nottingham architects. Particulars from Messrs Rorke & Jack, 10, King-street, Nottingham.

46. — **Salford.** — **EXTENSION OF OFFICE BUILDING ON WORKHOUSE SITE AT ECCLES NEW.** — Premiums 200, and 100. Particulars from Ward of Guardians, Salford.

Contracts.

BUILDING.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

22. — **Carlton.** — **ADDITIONS.** — Erection and alterations to the Welsh church, Carlton. Plans and specifications seen, and quantities taken. Crawshaw & Wilkinson, architects, Carlton-street, Burslem.

23. — **Kent.** — **REPAIRS.** — For repairs at the dwelling-house at East Peckham Girls' School. Specifications by the Committee. Architect, Mr. Wilfrid H. Robinson, House, Westminster.

24. — **Nottingham.** — **CHAPELS, ETC.** — Erection of a chapel, entrance lodge, etc., at Southern Cemetery, Wilford-hill. Plans and specifications and quantities from the architect, Mr. F. B. Lewis, Guildhall, on deposit of 20.

25. — **Deal.** — **ADDITION.** — Erection of an addition to the hospital hut at the Fever Hospital. Plans and specifications, etc., from

Mr. T. C. Golder, Borough Engineer and Surveyor, 23, Queen-street, Deal.

26. — **Kent.** — **REPAIRS, ETC.** — Execution of repairs, painting, and alterations to drains at the Sellindge Council School. Specifications and plans with Mr. W. H. Robinson, Caxton House, Westminster.

27. — **Westerham Hill.** — **COTTAGE.** — Erection of a cottage and other contingent works for the Metropolitan Water Board. Drawings, condition of contract, and specification at the offices of the Board (Chief Engineer's Department), Grosvenor-court, Strand. Deposit of 10.

28. — **Accrington.** — **CHURCH.** — Erection of first portion of Church of St. Paul, Barnfield. Mr. H. Ross, architect, 15, Cannon-street, Accrington.

29. — **Bierley.** — **RESTORATION, ETC.** — Restoration and enlargement of Bierley schools. Plans and quantities from Messrs T. H. & F. Healey, architects, 42, Tyndal-street, Bradford.

30. — **Bridlington.** — **ALTERATIONS.** — For alterations to the Corn Exchange. Drawings, specification, and conditions with Mr. J. Barnshaw, architect, Carlton House, Bridlington.

31. — **Cardigan.** — **IMPROVEMENTS.** — For carrying out improvements to the Council schools. Plans and specifications seen, and particulars from Mr. G. Dickens-Lewis, County Architect, Aberystwyth.

32. — **Cwmilly.** — **CHAPEL.** — Erection of a Primitive Methodist chapel. Plans and specifications with the Rev. T. Humphries, Bourne House, Somerset-street, Aberystwyth.

33. — **Ealing.** — **W. SWIMMING BATH.** — The Ealing T.C. invite tenders for new swimming bath at Longfield-avenue. See advertisement in this issue for further particulars.

34. — **Essex.** — **BUILDINGS.** — Erection of new dormitory buildings, Convalescent Home, Harold, W. Essex. Plans and specification seen, and quantities from Mr. John G. Morley, Borough Engineer, Town Hall, West Ham, E., on deposit of 10.

35. — **Pocklington, Yorks.** — **SCHOOL.** — Renovation of the Science and Manual Instruction Buildings, for the Governors of the Pocklington School. Plans and specifications at the School. Mr. Thomas Robson, Clerk to the Governors, Pocklington.

36. — **Ripon.** — **CHIMNEY.** — Taking down the chimney-stack at the old water-works. Mr. M. Kirkley, Town Clerk, Town Hall, Ripon.

37. — **Greetland.** — **TOWER.** — Erection of a sprinkler tower at Prospect Mills. Drawings and specifications for quantities from Messrs Clement Williams & Sons, architects, Post Office-buildings, Commercial-street, Halifax.

38. — **Halifax.** — **HOTEL, ETC.** — Erection of a house and open cart-shed at Stainland. Plans and specifications seen, and quantities from Mr. L. Coates, A.R.I.B.A., architect, 10, Central-street, Halifax.

39. — **Littleborough.** — **SHOP, ETC.** — Erection of a branch shop and two dwelling-houses at Centre Vale. Quantities from the architect, Mr. Herbert H. Clough, Butts-avenue, Rochdale. Deposit of 10.

40. — **Liverpool.** — **STORES.** — Erection of new stores. Drawings seen, and specifications from Mr. H. Stead, architect, Heckmondwike.

41. — **Llanrhaidar.** — **MANSE.** — Erection of a manse for the C.M. Church, near Oswestry. Plans and specifications from Mr. R. W. Davies, M.S.A., architect and surveyor, Carmo.

42. — **Manchester.** — **LIBRARY.** — Erection of a temporary library. Drawings seen, and specifications and quantities from the City Architect, Town Hall. Deposit of 10.

43. — **Oldham.** — **CHIMNEY, ETC.** — Construction of a new building and chimney for the grease disposal plant at the sewage works. Particulars from Borough Surveyor's Office. Deposit of 10.

44. — **Thorne.** — **REPAIRS, ETC.** — Repairs and improvements to Hatfield Levels Council School. Specifications from Mr. E. L. Harrop, Divisional Clerk, W.R. Education Offices, Goolse.

45. — **Belfast.** — **PAVILIONS.** — Erection of two pavilions and additions to the diphtheria pavilion at the Infectious Diseases Hospital at Purdyburn. Plans and specifications with Messrs Young & Mackenzie, architects, Scottish Provident-buildings, and quantities from Mr. Acheson Fernison, quantity surveyor, Scottish Provident-buildings, on deposit of 50.

46. — **London.** — **VARIOUS WORKS.** — Construction of sundry buildings, roofs, bins for road materials, etc., at depot, Richmond-street, Edgware-road. Drawings and specifications seen, and quantities from the Architect, Mr. T. W. Aldwinckle, 20, Denman-street, London Bridge, S.E.

47. — **Nantwich.** — **ALTERATIONS, ETC.** — For alterations and additions to the school buildings, Wistaston. Plans and specifications with Mr. H. Beswick, County Architect, Newgate-street, Chester. Deposit of 10.

48. — **Pennington.** — **ADDITIONS, ETC.** — Rebuilding of farmhouses, also alterations and additions to farm buildings, at Holebiggerah. Plans and quantities from Messrs J. W. Grundy & Son, architects and surveyors, Central-buildings, Ulverston.

49. — **Fenyddaren.** — **VILLAS.** — Erection of about twenty semi-detached villas. Plans and specifications with Messrs Johnson & Richards, architects, Merthyr Tydfil.

50. — **Southampton.** — **ADDITIONS, ETC.** — For alterations, additions, repairs, etc., at Bishop's Waltham girls' and infants' and boys' schools. Plans and specifications from Mr. W. J. Taylor, County Surveyor, The Castle, Winchester. Deposit of 10.

51. — **Walney Island.** — **ROOM, ETC.** — Erection and completion of a tramway waiting-room and convenience at Bigger Bank. Plans and quantities from the Borough Engineer, Town Hall, Barrow-in-Furness.

52. — **Cheshire.** — **SCHOOL.** — Erection of high school for girls at West Kirby. Plans and specifications seen, and quantities, on deposit of 20, from Mr. H. Beswick, County Architect, Newgate-street, Chester.

53. — **Merton.** — **OFFICES.** — Erection of additional offices. Plans and specification seen, and quantities, on deposit of 20, from Mr. G. Jerrard, Surveyor, Council Offices, Merton.

54. — **Pyle.** — **CHAPEL.** — Taking down old buildings and erecting a new chapel and school-room. Plans and specifications from Messrs Evans & Jones, architects, High-street, Port Talbot.

55. — **Belfast.** — **HALL.** — Erection of a village hall at Broughshane. Plans and specifications with Mr. Thomas Houston, architect, Kingscourt, Wellington-place, Belfast.

56. — **Oswestry.** — **HOUSES.** — Erection of ten almshouses. Plans and specifications seen, and quantities, on deposit of 10, from Mr. G. W. Lacey, Borough Engineer and Surveyor, Guildhall, Oswestry.

57. — **Selby.** — **COTTAGES.** — Construction of eight cottages at the depot. Plans and specifications from Mr. Bruce Gray, C.E.F.R.S. Ed., Council Offices, Selby.

58. — **Ashington.** — **WAREHOUSE.** — Erection of a warehouse, fodder house, and other alterations. Plans and specifications with Mr. O. Llythe, architect, Ashington.

59. — **Robbing Kent.** — **LAVATORY ACCOMMODATION.** — The Kent Education Committee invite tenders for lavatory accommodation at Council School, Robbing. See advertisement in this issue for further particulars.

60. — **Boston.** — **ALTERATIONS.** — Alterations to premises, Bridge-street. Plans and specifications with Messrs Killingsworth & Son, Dolphinstown, Boston.

61. — **Chesterfield.** — **COTTAGE, ETC.** — Erection of a cottage, stable, cart-shed, tripe-dressing shed, and appurtenant buildings. Plans and specification from the Borough Surveyor's Office, Salford Gate. Deposit of 10.

62. — **Eccles.** — **ALTERATIONS, ETC.** — Alteration of the Eccles and Patricot Hospital, and erection of a new wing. Plans with the architect, Mr. John Knight, Haworth-buildings, 6, Cross-street, Manchester. Quantities, on deposit of 20, from Mr. Edwin Parkes, Hon. Secretary, Town Hall, Eccles.

63. — **Sheerness.** — **ALTERATIONS.** — The Kent Education Committee invite tenders for alterations, painting, and repairs at Mile Town Council School, Sheerness. See advertisement in this issue for further particulars.

64. — **Wakefield.** — **POINTING, ETC.** — For pointing etc., to be done to the tower of the Town Hall. Specification seen, and forms of tender from Mr. J. P. Wakeford, City Surveyor, Town Hall, Wakefield.

65. — **Walsall.** — **CONVENTENCE.** — Construction of an underground convenience. Drawings and specifications seen, and quantities from Borough Surveyor, Council House, Walsall. Deposit of 20.

66. — **Southampton.** — **ALTERATIONS.** — For alterations at the Sholing Council School. Plans seen, and specification from Mr. W. J. Taylor, County Surveyor, The Castle, Winchester. Deposit of 10.

67. — **Brighton.** — **RECEIVING HOMES, ETC.** — The Guardians of Brighton invite tenders for four receiving homes and a separate infirmary on land adjoining Warren Farm Schools at Rottingdean. See advertisement in this issue for further particulars.

BUILDING—continued.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

AUGUST 8.—Dublin.—SHOPS.—The Great Southern and Western Railway are prepared to receive tenders for the erection of new wagon and carriage shops at Inchicore, Dublin. Form of tender, specification, and quantities from the Company's Engineer, Inchicore, Dublin, on deposit of 2l. 2s.

AUGUST 9.—Badyr.—RESIDENCE, ETC.—Erection of a villa residence, with garage, etc. Drawings and specification with Mr. W. H. Dashwood Caple, F.R.I.B.A., 3, Church-street, Cardiff.

AUGUST 10.—Castletford.—SCHOOL.—For alterations and repairs at the Castletford Wheldonians Council School. Plans seen, and specifications, with quantities, from the Education Architect, County Hall, Wakefield. Deposit of 1l.

AUGUST 19.—Dover.—SCHOOL.—The Dover T.C. invite tenders for infants' school at Bulwark Hill, Dover. See advertisement in this issue for further particulars.

NO DATE.—Belfast.—HOUSES.—Erection of business premises and terrace of houses at Cregagh-road. Plans, specification, and particulars from Mr. J. V. Brennan, architect, Belfast Bank-chambers.

NO DATE.—Darrington.—HUNT BUILDINGS.—Erection and completion of the Zeland Hunt new buildings, comprising kennels, stables, four cottages, cart-house, flesh-house, etc. Quantities from Messrs. J. J. Taylor & Minor, A.R.I.B.A., architects and surveyors, Post Office-chambers, Darrington.

NO DATE.—Hawarden.—RESIDENCES.—Erection of a pair of semi-detached residences at Elwice Green. Plans and specification from Mr. P. A. Roberts, M.S. architect and surveyor, East-road, Mold. Deposit of 2l. 2s.

NO DATE.—Kendal.—BATH.—For building a swimming bath, pavilion, and gymnasium at the Kendal Grammar School. Plans and quantities from Mr. John Hutton, architect, Kendal.

NO DATE.—Kendal.—HALL.—Erection of parish church hall. Plans and quantities from Mr. John Hutton, architect, Kendal.

NO DATE.—Newcastle.—COURTROOMS, ETC.—Erection of new picture-gallery and billiard hall. Mr. H. Booth, architect, Haslingden, Lancashire.

NO DATE.—Watford.—PREMISES.—Erection of a new business premises in Queen's-road. Plans and specification with Mr. Chas. P. Ayres, architect, 6, The Parade, High-street, Watford.

NO DATE.—Weymouth.—SCHOOL.—Erection of a secondary school. Drawings by Messrs. Crickmay & Sons, architects, 21, Mary-street, Weymouth. Deposit of 2l. 2s.

ENGINEERING, IRON, AND STEEL.

JULY 24.—Ilford.—CULVERT.—Constructing a reinforced concrete culvert in the South Park. Forms of tender and particulars from Mr. H. Shaw, M.Inst.C.E., Engineer and Surveyor to the Council, Town Hall, Ilford, on deposit of 2l. 2s.

JULY 27.—Cardiff.—STERILISING APPARATUS.—Provision of steam sterilising apparatus, etc., at the Workhouse. Specification by Mr. S. W. Allen, M.I.M.E. Mr. A. J. Harris, Clerk, Union Offices, Queen's-chambers, Cardiff.

JULY 28.—Guildford.—FRAMEWORK, ETC.—Supply and erection of steel framework for the proposed new coal store; erection of a travelling talpher and coal grab; erection of a set of water-tube condensers. Specifications and particulars from Mr. P. C. Cleasby, Gas Offices, Guildford. Deposit of 10s. 6d.

AUGUST 1.—Glamorgan.—HEATING APPARATUS.—Supply and erection of one new hot-water apparatus at Angelton Asylum, near Bridgend. Specifications from Mr. W. E. R. Allen, Clerk to the Committee of Visitors, Glamorgan C.C. Offices, Westgate-street, Cardiff. Drawings with the consulting engineer, Mr. H. T. Sully, Southfish Widows' Buildings, Bristol.

AUGUST 7.—Matlock.—MILLS, ETC.—For the laying of mains and services, for the Chapel Whaley and District Gas Company. Specification, with quantities, from Mr. Thomas Brown, engineer, Fern Bank, Matlock.

AUGUST 9.—Southampton.—HEATING.—The Southampton C.C. invite tenders for low-pressure hot-water apparatus at (1) Robin Sholing Infants' Council School; and (2) Greathead Council School. See advertisement in this issue for further particulars.

AUGUST 10.—Hemel Hempstead.—HEATING AND LIGHTING.—The Hemel Hempstead Education Authority invite tenders for low-pressure water heating and lighting. See advertisement in this issue for further particulars.

AUGUST 12.—Witchington.—BOILER.—Supply and delivery at the Withington Baths one Lancashire boiler, 28 ft. long by 8 ft. diameter; one

economiser of forty-eight pipes, and engine, etc. Specification from the City Architect, Town Hall. Deposit of 1l. 1s.

NO DATE.—Wolverhampton.—GENERATING STATION.—Erection of a complete station, including buildings and plant to generate direct current at 440 volts, with a continuous output of 1,000 k.w. for the Knowles Oxygen Company, Ltd., Wolverhampton.

FURNITURE, PAINTING, MATERIALS, ETC.

JULY 24.—Ebbw Vale.—PAINTING, ETC.—Painting and colouring the Rassan Council School and the Tylwyn Council School. Specification with the architect, Mr. Henry Waters, M.S.A., Market-chambers, Ebbw Vale.

JULY 25.—Bargoed.—PAINTING, ETC.—For painting and decorating the Cottage Hospital. Particulars from Mr. Geo. Kenshole, M.S.A., Station-road, Bargoed.

JULY 25.—Isle of Wight.—PAINTING, ETC.—For repairing and painting various schools. Mr. F. G. Flux, Secretary, County Education Offices, Newport, I.W.

JULY 25.—London, N.W.—PAINTING, ETC.—The Willenden D.C. invite tenders for cleaning and painting works at Public Offices and Education Offices, Dyne-road, Kilburn, N.W. See advertisement in this issue for further particulars.

JULY 25.—London.—PAINTING, ETC.—Painting the whole of the external ironwork of the Workhouse in Endell-street; also of the Guardians' offices and the receiving house for children and nurses' home in Broad-street, Bloomsbury. Mr. James Appleton, Clerk to the Guardians, Guardians' Offices, 57, Broad-street, Bloomsbury, W.C.

JULY 26.—Bradford.—PAINTING.—For painting at the St. James's Market, Abattoirs, and Cold Storage. Specification from City Architect, Town Hall, Bradford.

JULY 26.—Kent.—PAINTING, ETC.—For painting and repairs at the Kippie Council School. Specification by the Committee's Architect, Mr. W. H. Robinson, Caxton House, Westminster.

JULY 26.—Stourton.—PAINTING, ETC.—The Midland Railway Company are prepared to receive tenders for cleaning and painting wagon shops at Stourton, wheelwright's shop at Hunslet-lane, and carriage shops at Leeds. Specifications seen, and quantities and particulars from the Engineer's Office, Derby Station.

JULY 27.—Kent.—PAINTING, ETC.—For painting and repairs at the Rainham Council School. Specifications by the Committee's Architect, Mr. W. H. Robinson, Caxton House, Westminster.

JULY 27.—Thanet.—REDECORATION.—Interior redecoration on the first floor of the administration block of the Thanet Isolation Hospital. Haine. Specification from the Board's Architect, Mr. E. Bertram Langham, Bank-chambers, High-street, Broadstairs.

LAW REPORTS Continued from page 84.
sowers, especially in times of storm, too
l. He held that there had not been any
agency in carrying out the original scheme.
The only remedy appeared to be under
299 of the Public Health Act. He gave
leave for defendants, with qualifying fee
Mr. Paterson.

OBITUARY.

Mr. J. R. Hacking.
John R. Hacking, a young Glasgow
lect, who, in conjunction with Mr.
am Henderson, was recently awarded a
first guineas premium for his competitive
plans for the Manchester Library and Art
Building at Edinburgh on Saturday at
age of twenty-nine.

FOREIGN AND COLONIAL.

Brigade Station, Antwerp, Belgium.
M. Consul-General at Antwerp (Sir E. C.
slet) reports that tenders are invited by
municipal authorities of that city for the
erection of a first brigade station on the
boulevard quay. The estimated value of
contract is 13,350 frs. (about 534l.), and a
bit of 1,000 frs. (40l.) will be required with
tender. Tenders must be sent in sealed
envelopes to the Mayor, Hôtel-de-Ville,
Antwerp, to arrive not later than July 24. The
prix des charges may be obtained (price 1
fr.) at the Hôtel-de-Ville, Antwerp. A copy
may be seen by British firms at the Commer-
cial Intelligence Branch of the Board of Trade,
Whitehall-street, London, E.C.

Works in Portuguese East Africa.
M. Trade Commissioner for South Africa
has announced that the Mozambique Company has
announced its intention to establish a firm
with modern appliances. An additional
factory is to be built over the Chiveve, and
the works are to be taken to establish a tele-
graph and a telegraph service. A new hospital
school for European children are to be
built. The port captain of Ponta Goa is to
order the necessity for new buoys. The
company intends to do its utmost to secure the
immediate construction of the Sona railway.

University Buildings, Rome.
The Gazzetta of July 6 publishes a decree
issued in favour of the Ministry of Public
Instruction a sum of 3,000,000 lire (120,000l.)
for the construction of buildings in the Royal
University of Rome. The operations will
be completed over a period of five years.

TRADE CATALOGUES.

We have received from Mr. John P. White,
of the Pygmy Works, Bedford, and 134, New-
street, London, W., a small pamphlet
entitled, "English Oak and its Application,"
increasing use of foreign oak has only
led to show the superiority of our native
oak in durability, texture, grain, and figure,
and is not ready shown by the numerous
examples still extant of oak-framed houses
from many hundred years back.
Oak seasons slowly; some of the oak
in the Pygmy Works has been in the
yards for over sixty years. The
timber, of all sizes and ages, repre-
sents many years of careful selection, and the
timber furniture into which it is metamorpho-
sed by Mr. White is worthy of its origin.
The designs are good, and reminiscent of the
work of our own men, but our ships,
"beasts of oak." Oak panelling recently
used at Longstone Hall, Cambs, to the
admiration of Messrs. Simpson & Ayrton, is also
derived from the booklet.
The Dallet Electric Clock Company, of
Lancaster, Holborn-viaduct, London,
send us a price-list of their system of
electric clocks. In the case of a railway or
other building where a number of clocks
are required to keep uniform time the ad-
vantage of a master clock controlling any
number of secondary dials is obvious. This is

the Dallet system, which has the further
recommendation that no winding is necessary
in either master or dials, the energy being
obtained from primary batteries of the ordi-
nary type used for electric bells, or from a
direct current electric supply. In effect the
system amounts to the substitution of one
clock for many, and should be eminently suit-
able for factories, schools, hotels, hospitals,
business premises, railways, and a thousand
and one other cases where time is of value.

PATENTS.

APPLICATIONS FOR PATENTS.
14,930 of 1910.—Wilfred Andrew: Cows for
chimneys, ventilating shafts, and the like.
15,655 of 1910.—Paul Decauville.—Presses for
moulding cement bricks and the like.

in 74 yrs.....

Contractions used in these lists.—F.g.r. for freehold
ground-rent; l.g.r. for leasehold ground-rent; i.g.r. for
improved ground-rent; g.r. for ground-rent; r. for rent;
f. for freehold; c. for copyhold; l. for leasehold; p. for
possession; e.r. for estimated rental; w.r. for weekly
rental; q.r. for quarterly rental; y.r. for yearly rental;
u.t. for unexpired term; p.a. for per annum; yrs. for
years; la. for lane; st. for street; rd. for road; sq. for
square; pl. for place; ter. for terrace; cres. for crescent;
av. for avenue; gds. for gardens; yd. for yard; gr. for
grave; b.h. for beerhouse; p.h. for public-house; o. for
office; s. for shops; ct. for court.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary
and artistic matters should be addressed to "THE
EDITOR" (and not to any person by name); those
relating to advertisements and other exclusively
business matters should be addressed to "THE
PUBLISHER," and not to the Editor.

All communications must be authenticated by the
name and address of the sender, and for publication
you or not. No notice can be taken of anonymous
communications.

The responsibility of signed articles, letters, and
papers read at meetings rests, of course, with the
authors.

We cannot undertake to return rejected communica-
tions, and the Editor cannot be responsible for lost
drawings, photographs, manuscripts, or other docu-
ments, or for models or samples sent to or left at this
office, unless he has specially asked for them.

All drawings sent to or left at this office for con-
sideration should bear the owner's name and address
on either the face or back of the drawing. Delay and
inconvenience may result from failure to do this.

Any communication to a contributor to write an article,
or to execute or lend a drawing for publication, is given
subject to the approval of the article or drawing, when
received, by the Editor, who retains the right to reject
it if unsatisfactory. The receipt by the author of a
proof of an article in type does not necessarily imply its
acceptance.

N.B.—Illustrations of the First Premiated Design in
any important architectural competition will always be
accepted for publication by the Editor, whether they
have been formally asked for or not.

PRICES CURRENT OF MATERIALS.

. Our aim in this list is to give, as far as possible, the
average prices of materials, not necessarily the lowest.
Quality and quantity obviously affect prices—a fact
which should be remembered by those who make use of
this information.

BRICKS, &c.
Per 1000 Alongside, in River..... 2 s. d.
Best Stocks..... 13 0
Picked Stocks for Facings..... 2 7 0

 Professor Reginald Blomfield, A.R.A., Architect.

PROFESSIONAL UNITY.

THE correspondence we have lately published on the unity of the profession reveals anything but unity with regard to the fundamental as upon which such practical policy as we referred to in our leading article could be founded.

Registration having been before the profession for some years, discussed at one length, and finally adopted by the statute as its official policy, it might be thought that there is no practical advantage in opening up the whole question again, as one of our correspondents suggests.

But although the principle of Registration must, we suppose, be regarded for

all practical purposes as a *chose jugée*, that is not to say that the methods by which it is to be brought about, or the concrete form into which the abstract principle will be crystallised, are not still open to discussion. On the contrary, it seems evident that there is much hard thinking to be done to arrive at unity on fundamental points and to avoid the mental chaos of which complaint is made.

On no point is this more necessary than on the question of examination, which appears to alarm some of those whose chief concern is for the art of architecture. We entirely sympathise with those who feel this alarm, but we cannot profess to share it to the

same extent, as we hardly think the difficulty of this question is so great as to be fatal either to Registration on the one hand or to the artistic element of architecture on the other.

It is just possible that too much is taken for granted and that an argument is built up on an assumption which is open to doubt. That "the highest æsthetic elements are obviously outside the examination pale" is a statement which, we think, will hardly commend itself to academic and educational circles. If you can teach a subject it seems probable that you can generally discover a method of ascertaining the results of your teaching. To admit the

impossibility of examination seems to imply the impossibility of teaching. It is hardly to be supposed that such a school as L'Ecole des Beaux-Arts, for instance, would be prepared to admit that it does not and cannot teach the highest æsthetic elements or that it finds it impossible to examine in them when taught.

After all, every distinction conferred upon an artist by his fellow artists, whether election to the Academy or the gold medal of the Institute, is by examination into his qualification in the highest æsthetic elements of his art. To examine seems a theoretical possibility, and, provided the examiners know what these elements are and pursue a right method in their process of examination, it should also be a practical one.

Unless some steps are taken to see that only the fit are registered, Registration would be a farce. The method whereby this will be done is called—for lack of a better word—an examination, but it does not necessarily follow that it must be by means of written answers to printed questions, or even that it should have the faintest resemblance to anything that passes under that name at the present moment. It may do so, if found advisable, but it is not necessary in the nature of things. It will be the architects' own fault if any examination is instituted which tends "to endow artistic incapacity with a recognition which it does not merit," or to result in a curtailment of "artistic liberty" or in an outrage on the susceptibilities of the "artistic temperament."

It is, however, just because we see so clearly that the artistic element is the one essential element in architecture and in the personal qualification of the architect, that we think it so necessary to realise exactly what we mean when we use such terms as the "highest æsthetic elements," "artistic liberty," and the "artistic temperament." Licence is sometimes mistaken for liberty, in art as elsewhere, and artistic taste for artistic ability.

Before we can expect the whole of the practical politics of the profession to be arranged to suit the convenience of the artistic temperament, we must make it quite clear that we are not asking this simply for the sake of that abnormal nervous development which carries with it hyper-sensitiveness to sense impressions of all kinds. Because a sensitiveness to beauty is one of them we can hardly expect everyone to take it for granted that it also carries with it in every case the imaginative insight and creative power necessary to architectural conception, and that a taste for art is always the same thing as a capacity for it.

Any such irresponsible and neurotic temperament as may be mistaken for "incorrigible laziness" is evidently no use to the architect, so there seems no reason for making special arrangements to suit it. Indeed, it might even be considered as one of the advantages of a properly constituted examination that it may tend to discourage the neurotic from undertaking professional responsibilities for which they are temperamentally unfit, without putting any difficulties in the way of those with real

artistic ability, whose extreme sensibility is balanced and controlled by a corresponding mental development and general sanity of outlook.

But even the most capable and genuine artist has to realise that the conditions under which architecture is practised here and now differ from those of other arts. If by temperament or inclination he is unwilling to accept them, he would probably feel more at home in some other art. When he proposes to practise architecture he deliberately ranks himself as an artist who is willing and should be able to assume professional responsibilities. These responsibilities may not be theoretically necessary to the practice of architecture, the day may come when they will be no longer undertaken, but while they obtain they must be discharged.

If the wrong sort of examination may do all the harm our correspondent fears, the right sort may conceivably do some positive good to the artist by forcing him to concentrate at once on the principles of his art, and to realise, before it is too late, the conditions and limitations of its practice.

The right sort of examination is only to be obtained by a common agreement as to the fundamental ideas upon which any real unity of the profession must be based.

ST. PAUL'S BRIDGE.

E must confess that we are rather surprised to see that a politician with so much experience in public affairs and of such wide culture as Mr. A. J. Balfour should have made the remark attributed to him when supporting the Corporation Bill in the House of Commons:—"He hoped the House would feel that it was impossible to defer a settlement of this important question . . . until every scheme had been discussed from every point of view." With all respect to so exalted a personage, we should have thought that the very importance of the question was just the reason for considering this and every other scheme from every point of view. As Mr. Dickinson said, it was worth the delay of another year to obtain a better scheme, and as the Corporation's own witness admitted, it would be easy to find a better one, so why the House should feel it impossible to defer a settlement of the question for one year, or five, if necessary, till this better scheme be found, is not quite evident. Had this remark been made by the typical City alderman, we could have understood it. For him the importance of the question would consist in the susceptibilities of the Corporation, in the fact that a scheme deliberately prepared at much trouble and expense by eminent City officials and approved by the great, wise, and wealthy Corporation itself should be held up indefinitely, or even thrown over altogether, for the sake of a few artists—insignificant people of no standing in the City whatever. Coming, however, from one who in the same breath reminded the House that he had often pleaded for a wider and broader consideration of this question of the æsthetic beauty of London, we can only presume that he found an occasion which might bring him into conflict with

his constituents inopportune to preach this cause again. Possibly, however, it is part of the duty of the representative of the City to represent its worst as well as its best aspects. Though the voice may be the statesman's voice, the hands are the hands of the alderman. It is no as if the importance of the question consisted in an immediate, pressing need for the bridge. It is generally recognised that its inception is due quite as much to the fact that some use must be made of the income derived from the Bridge House Estates as to the necessities of the traffic. Had it been necessary to pay for the bridge out of the rates, the need for it might not have been discovered for some years to come.

After taking sides with the Philistines in his capacity of senior member for the City in spoiling the most important London improvement of our generation and adding another to our lost opportunities, Mr. Balfour, no doubt, felt it due to himself as a man of taste to let the House know that he was not insensible to the value of the æsthetic element, and had a cultured appreciation of the beauty of architecture. Curiously enough in so doing he referred to the advantages of the removal of the "atrocious iron bridge over Ludgate Hill," without seeming to be aware of the fact that, as we have already pointed out, this is just one of the improvements which would naturally follow on the development of Blackfriars as the main through traffic artery, but would be deferred indefinitely by the scheme which he supported. We cannot help wondering what trouble Mr. Balfour took to post himself in the facts of the case or how far he thought it right to ascertain what was "to be found in the limits of possibilities" before he felt justified in throwing the weight of his influence into the scale in favour of the scheme proposed by his constituents.

NOTES.

WHEN the question of St. Paul's Bridge was under discussion the evidence of a gentleman was admitted who said that his business had called him to the City of London for something like thirty years (we think it was thirty), but that he had never heard anyone talk of vistas. We do not remember the particular business in which the gentleman's question happened to be engaged, but it was certainly not in the business of vistas. In this matter, therefore, his evidence, on his own admission, was valueless, although it would no doubt be of the greatest value in the matter which had occupied his attention for so long and, we hope, so profitably. And this very gentleman would be the first we imagine, if he is the practical and clever man we believe him to be, to take objection to any outside opinion on his own business concerns by one wholly ignorant of the elementary principles on which they are conducted. The evidence of this sort should have been admitted at all, and carry the weight which it undoubtedly did, only goes to show the confusion which exists in the minds of our Parliamentary and municipal authorities when matters involving artistic

considerations come into view. When a question of dry goods arises, let us have all means the evidence of men who have lived and thought in dry goods; when it is a question of architectural art, then also let us go for guidance to men who have lived and thought in architectural effect. But for goodness' sake do not let us mix up the witnesses except the opinion of either upon matters to which they have given no thought.

Is it, however, only our commercial friend who so frankly ignores the point of view which is involved? The position of St. Paul's Bridge is an instance; but does the position of the proposed King Edward Memorial, in which any element of business or the necessities of traffic, is, or should be, entirely absent, provide a happier illustration of the solution of a problem which is at all times difficult? We rarely think so. We referred to this in our last week, but we have no hesitation in referring to it again. Here, as in the case of the bridge, the question of the still awaits an answer. And in instance not only on account of architectural effect, not only on account of the proper disposition of more or less exact forms in relation to other forms at a distance, but also on account of relation to the character of the subject of the memorial. And with this latter before us we can think of no monument of recent years raised to the glory of a monarch of which the choice has been so ill-chosen.

In thinking over the interesting announcement that a course in academic architecture is to be instituted at the University of London, with Dr. J. J. Burnet, F.R.I.B.A.,—"one of the very best architects practising in England who have gone through the full course at the École des Beaux-Arts and passed into the first class"—as visitor, one considers presents itself. To quote the lecturer:—"The course is not intended for beginners, but for those who have already attended a course of architectural training at a university (or other institution), or have otherwise obtained their preliminary education"; further down one of the qualifications necessary for admission, besides competence in draughtsmanship, construction, and the Orders:—"That the candidate have a fair knowledge of design." It seems to us—and we wish to express our view without relinquishing our sympathy with Professor F. M. Benson and the College authorities in the sense of the difficulties attending the institution of a very interesting project—seems to us that the previous training required, almost of necessity at least, must come from the Beaux-Arts teaching, for one must suppose Dr. Burnet would hardly go so far to nullify, if it does entirely vitiate, the efforts of those who conduct the course. So much will be to be untaught and unlearned, and more valuable men, those with most of those who have got most firmly which their opportunities at a university (or other institution) have enabled them to obtain, may be relied

upon to offer the strongest resistance to any new doctrine. Surely by this time it is agreed that the great value of the Beaux-Arts' School lies in the system which pitches a young man from the very beginning into a turmoil of talk and large design, and permits him to gain more by the imperceptible processes of unconscious absorption—with ineradicable effect—than by direct teaching, which he may neglect if he does not consciously deny. From the outset, that provincialism (an inexact word, but we can hit on no better) of attitude, rendered possible and indeed almost inevitable by our system of separate "years" and classes, becomes impossible to the Parisian student. It is at the erasure of the "parochial" stigma that the next forward step in education in this country will aim.

The Professions and Municipal Work.

MR. B. WYAND, at a recent meeting of the Institute of Municipal Engineers, expressed the view that all engineering works would in the future fall into the hands of Government or municipal engineers, and that engineers acting as consultants or in an independent professional capacity will become extinct. We must say we should consider it greatly to be deplored if Mr. Wyand's prognostications prove correct. The engineer is in a way an inventor, accustomed to consider problems in a broad way, and deal with them by the exercise of imaginative faculties. Now, only a limited number of men possess these, and the tendency of municipal routine is to stifle them even where they exist, so that the average municipal officer, who may be fully competent to control important undertakings, will inevitably prove less able to initiate than the independent practitioner whose whole energies are devoted to original design. This argument applies equally to architecture and to all the arts and sciences demanding initiative, and it will prove to be a sad day for these if the methods suggested by Mr. Wyand are generally accepted. For our part we have always advocated every course tending to encourage experiment and imagination, believing that any other system fosters stagnation rather than vitality.

The Y.M.C.A. Building, Manchester.

IN our issue of February 10 the Y.M.C.A. last a full account was given of this building, which recently formed the subject of a paper read to the Concrete Institute by Mr. Alfred E. Corbett, F.R.I.B.A., one of the architects. The author states that the original working drawings contemplated brick walls and skeleton steel construction, and the decision when they were nearly completed to adopt reinforced concrete was largely due to two parts of the building which seemed peculiarly suited for such construction. These were the large swimming-bath on the top floor and the wide span of the ceiling and floor above the great hall. Matters were somewhat complicated by the delayed approval of the Manchester City authorities, and when reinforced concrete had been definitely accepted there was not time to recast the architectural drawings so as to make them truly expressive of the

material. We are quite at one with Mr. Corbett in the opinion that the architect who wishes to evolve a design worthy of being considered as reinforced concrete architecture must tackle the problem from the first with that ideal before him, and must not attempt to make a design equally suitable for brick walls or reinforced concrete, whichever it may please the authorities to sanction.

"I AM come from my Stafford House, house to your palace," St. James's, said Queen Victoria upon one occasion to the Duchess of Sutherland. It is stated that the lease of the mansion is about to be sold by the Duke of Sutherland. Stafford House was begun in 1825 for the Duke of York from designs by Sir Robert Smirke. When the building had reached the ground floor Smirke was superseded in favour of B. Dean Wyatt. In pursuance of the Acts 4 and 5 Vict., c. 27, and 5 Vict., c. 20, the Crown sold the house to George, second Marquis of Stafford and first Duke of Sutherland, for an annual rent of 758l. and the cost, 72,000l., of the building, the latter sum being devoted to the laying-out, by Pennethorne, of Victoria Park. Two years subsequently Sir Charles Barry remodelled the interior, added the masked top story, and built the stabling. For the site were pulled down the library built by Kent, 1737, for Queen Caroline, and Godolphin House, the last home in London of C. J. Fox.

SIR ROBERT STODART LORIMER.

KNIGHTHOOD was conferred upon Mr. R. S. Lorimer on the morning of Friday, 21st inst., at Holyrood, just before their Majesties' departure from Edinburgh. The news is a source of gratification to all who regard themselves as belonging to the profession.

Sir Robert, a younger son of the late Professor Lorimer, of Edinburgh University and Kellie Castle, Fife, was born on November 4, 1864. He entered Sir Rowand Anderson's office as pupil in 1887, where he stayed for four and a half years, subsequently working in Mr. Bodley's office in London. He then returned to Edinburgh, where he has been engaged ever since in building up a reputation which, as far as those who know his work are concerned, no honour can augment. In *Who's Who* "foreign travel" is given as his recreation. Articles on Sir Robert Lorimer's earlier work were published in the *Builder* of September 25, 1897; June 11, 1898; March 18, 1899; and illustrations in February 12, 1898; July 13, 1898; September 28, 1895. The greater part of his achievement is concerned with the restoration of, and addition to, the old Scottish houses with the unique style of which he is so profoundly familiar. The story of how Professor Lorimer gradually converted Kellie Castle from a misused and almost disused ruin to one of the most delightful of all examples of a peculiarly fascinating period has by this time an assured place in architectural lore. It serves in part to account for his son's feeling for the old work of Scotland, though it may not be assigned as the sufficient cause of his unequalled power of infusing with the old zest and spirit his independent work, as fresh in design as it is new in material.

The high-water mark (so far,—we speak provisionally) of the achievement of his peculiar ability, the Chapel of the Knights of the Thistle, was fully illustrated in the *Builder* last week. In the Royal Scottish Academy's exhibition this year there are

Professor Reginald Blomfield, A.R.A.
(Portrait by Reginald Haines.)

photographs and drawings of Rowallan, a considerable mansion in the north of Ayrshire. It is an instance, if we have been rightly informed, of an architect's success in persuading a client to abjure restoration and build anew. The old Rowallan Castle, an especially pleasing place, stands untouched close by.

Work at Earlshall, Leuchars. Fifte. the large place in Ayrshire, called Ardkingless, and the restoration of Lympne Castle. Kent. are known through illustrations in the professional Press; and we must not omit mention of the Roman Catholic Church of St. Peter's, at Morningside, Edinburgh, which shows perhaps better than any other example the architect's originality of conception and freshness of detail, in which no trace of the unpleasant emphasis which so often goes with modernity in design can be discerned. In conclusion, we would tender our very sincere congratulations to Sir Robert Lorimer, on his receiving an honour he so fully deserves—and remind our readers that he is not yet forty-seven years of age.

CONTEMPORARY ARCHITECTS AND THEIR WORK:

PROFESSOR REGINALD BLOMFIELD,
A.R.A., F.R.I.B.A., F.S.A.

THE Royal Academy of Arts is happy in having for its Professor of Architecture a man singularly blessed, not only in possessing a wide theoretical knowledge of his art, but in being well versed in its practice. For Professor Blomfield is not only one of our most erudite and scholarly architects, but he adds to a fine scholarship the corrective experiences of an extensive practice.

Mr. Blomfield is the third son of the late Rev. G. J. Blomfield, M.A., Rector and Rural Dean of Aldington, Kent. He was educated at Haileybury and secured an exhibition scholarship to Exeter College, Oxford, where he took a second in Classical Mods. and a first in Classical Greats (1870). He played cricket for the Seniors while at College, and that game, it may be remarked, has always been one of his chief recreations. His professional career commenced in the office of Sir Arthur Blomfield, to whom he was articled for three years, Sir Arthur being his uncle, and not, as is so frequently stated,

his father. Mr. Blomfield also studied at the Royal Academy Schools, winning prizes of 10*l*. and 25*l*. Subsequently he travelled extensively in France, and laid the foundations of a wide knowledge of French Renaissance work, about which he knows probably more than any other English architect. Mr. Blomfield was elected A.R.A. in 1901 and was appointed Professor of Architecture shortly after. He is also an Hon. Fellow of Exeter College, Oxford, a Fellow of the Royal Institute of British Architects, and Fellow of the Society of Antiquaries.

Mr. Blomfield's practice, commenced in 1884, is a very large one, principally in large country houses, but he has also designed school buildings, one or two clubs, banks and other business premises. It is impossible to mention more than a tithe of his works, but among the principal the following may be mentioned:—

Country Houses.—Apthorpe, Northants; Brooklesby, Lincolnshire, for the Earl Yarborough; Boldre, Hants, for Mr. Herbert Alexander; Barwythe and Gog Magog, Cambridgeshire, for Mr. Ernest Alexander; Heathfield Park, Surrey, for Mr. V. Alexander; new hall at Drakelow, Derbyshire, for Sir Robert Gresley, Bart.; Elford, N.B., for Admiral Bainbridge; Camthorpe, Lincolnshire, for the late Mr. Edg. Lubbock; Cowley Place, Usbridge, for Major A. Tylden Patterson; Chequer Court, Bucks, for Mr. Arthur Lee, M.P.; The Friars, Winchelsea, for Mr. G. L. Freeman, K.C.; Godington, Kent, for Mr. Ashley Dodd; Saltcote Place, Rye, for Mr. R. Hennessy; Leasam, Rye, for Rear Admiral Sir George Warrander, Bart.; Knowlton, Kent, for Mr. Elmer Speed; Mystole, Kent, for the late Mr. Pomfry, M.P.; Mellestam, N.B., for Col. L. Binning; Murraythwaite, N.B., for Mr. Murray; Garmons, Hereford, for Sir John Cotterell, Bart.; Whitehall, Sandwich, a Hill Hall, Essex, for Mr. Charles Hunt; Whittington, Great Marlow, for Sir Huds. E. Kearsley, Bart., M.P., and Wyphur Cranleigh, Surrey, for Sir Charles E. Chadwyck-Healey, K.C.B., K.C.

Town Houses.—No. 6, Grosvenor-lane, London, for Mr. George Albu; No. 20, James's-street, London, and Kent House (reconstruction), Knightsbridge, London, for Mr. Saxon Noble.

Miscellaneous.—The Goldsmiths' College extensions; New Cross; Sherborne School Buildings; Whitby School, Chichester; school buildings, Haileybury College, and the South African War Memorial there; alterations to the Oxford and Cambridge Club, London; the United University Club, London; Paul Cross, St. Paul's Cathedral, London; London County and Westminster Bank, King's-road, Chelsea; warehouse, Greycoat-place, Westminster; Portsea Parish Institute, etc.

Of the recent buildings illustrated in t

"Whitehall," Sandwich: from S.E.
Professor Reginald Blomfield, A.R.A., Architect.

Wyphurst, Cranleigh, Surrey, is a large extension and practical rebuilding of an old and much smaller house, seen on the left of the general view, which in turn is an enlargement of a cottage. The work on the extreme right has been confined into a private chapel, and the house has been planned afresh with the exception of the old dining-room. To the west of the house an enclosed private garden has been laid out, with raised grass walks and water-features. The walls are faced with thin red bricks and Portland stone dressings, and the floors are covered with red tiles. Leaded glass windows and metal casements are used for the lower floors. The stone carving, including a fine panel over the hall chimney-piece, is the work of Messrs. W. Aumonier & Son; the plaster ceiling in the same

room, and that in the drawing-room also, were carried out by Messrs. G. Jackson & Sons.

At Chequers Court Mr. Blomfield practically reconstructed the interior of an historic Buckinghamshire house, the work being carried out for Mr. Arthur Lee, M.P. Our view shows the oak screen, with gallery over, in the hall, this being an exceptionally fine piece of modern woodwork. The oak-work was executed by Messrs. Maides & Harper, of Croydon, the carving of the spandrels, etc., being the work of Messrs. W. Aumonier & Son.

Whitehall, Sandwich, is a golf-box built for Mr. Charles Hunter on the edge of the shore between Deal and Sandwich links. The seawater penetrated within 2 ft. of the footings at high tide, and accordingly the

whole of the site was covered with a raft of concrete, on which the house has been built. The walls are built with a hollow space, and are harled or roughcasted on the outside; and the roofs are covered with Delabole slates. Mr. T. J. Denne, of Walmer, was the general contractor; the sanitary work was carried out by Messrs. Matthew Hall & Co., and the house is lighted on the system of the Non-Explosive Gas Company, Ltd. The work at Kent House, Knightsbridge, represents alterations and decorations that have been carried out for Mr. Saxton Noble. These included the formation of a new entrance hall, alterations to the drawing-room, the provision of new heating and hot-water installations, and a fresh drainage scheme. In the hall the ceiling is picked out with gold, which, owing to the photographic

Chequers Court, Bucks: The Hall.
Professor Reginald Blomfield, A.R.A., Architect.

reproduction, comes out too black in the illustration.

Moundsme Manor, Hants, is one of Mr. Blomfield's latest big houses, and was designed for Mr. Wilfred Buckley. The grounds necessarily do not yet show to any advantage. The walls are faced with thin red bricks, five courses to the foot, the quoins and other dressings being of Portland stone. The entrance is on the north side, the porch leading at once to a dignified and well-proportioned hall, from which the staircase hall is separated by a columnar screen. Beyond this in the west wing is the billiard-room, approached by a short corridor passing the study, which latter faces west. A private entrance for the study is planned in the south-west corner of the forecourt. The library, drawing-room, and dining-room face south, occupying the whole of the ground floor on that front. The kitchen and servants' quarters are grouped round a court on the east side, the kitchen itself forming the ground floor of the east wing, balancing that on the west. The bedrooms are planned on the American system, being arranged in suites of two, separated by a space in which a bathroom, serving both rooms, is contrived on the window side, the corridor side of this space being taken up by large clothes closets for each room. A nursery suite is arranged on the second floor, where also are the servants' bedrooms. The house is warmed by a central system of heating, the radiators being fixed under the windowsills, and having fresh-air inlets. A fire hydrant system has also been provided.

It is fortunate for English architecture that the trammels of practice have not absorbed all Professor Blomfield's energies, and that he has been able to exercise his gifts as a writer. In addition to powers of lucid exposition and literary expression, he possesses a keen analytical faculty and a liking for original research. Though his "History

of the Renaissance in England" (perhaps his best-known work) is generally cited as one of the leading text-books on the subject, Mr. Blomfield has never written a text-book in the generally accepted sense of the term. A text-book is usually regarded as a dry restatement of accepted facts, set out in a more or less handy form for easy assimilation by students, but Mr. Blomfield's writings are the exposition of his personal views on architecture, based on analytical studies of men and buildings, the results of research, the revaluation of accepted conclusions and accomplishments, and, in some cases, the pricking of bubble reputations. Indeed, English architecture had long been in need of such trenchant criticism as Mr. Blomfield has been able to give it. The disposition to base fresh arguments upon the conclusions of previous writers, conclusions too often resting on no more substantial basis than personal predilection, has been a stumbling-block in our architectural literature. Our view has been hampered by interposing a veil of reputation in front of names that are but shadows in architectural history. If the Professor tears down these veils, whether we agree or not with the reasons for so doing, we are at least indebted to him for showing us upon what slender foundations our own esteem is built. Thus Mr. Blomfield scouts the claims of John Thorpe to pre-eminence, and, indeed, they rest on little but his book of drawings, and Horace Walpole's attributions, which latter fail badly under close scrutiny. In the same way, and within the last few months, Mr. Blomfield has attacked the pretensions of Du Cerceau, who, though only a name to many of us, has, at all events, always been a great name.

An interesting article in his "Studies of Architecture" is that on Dance the younger, who will be remembered as the architect of Newgate, one of the finest conceptions of a prison, in the abstract, ever carried into

effect. This was Dance's only work of merit, and it is curious that a man who could carry architectural expression to so high a pitch should have failed in everything else that he did. Of course, it is not uncommon for a man to achieve one thing that lives in the course of his career, and most people are content to accept the fact. Such an occurrence, however, is a provocation to Mr. Blomfield, who reveals to us the operation of great influences on an inferior mentality, and shows how Newgate, the second work attempted by Dance after his return from Italy, may be traced to the magnetic influences of the great Italian buildings, and in particular, to Piranesi's dreams of Cyclopean masonry.

Indeed, this argument from the man to his work is one of the principal features of Mr. Blomfield's criticism. Stated in his own terms, it lies in "realising the personality of the architect and tracing its effect in his work. The vital interest in architecture is the human interest, the play of personal temperament, which is as clearly traceable in the works of architects as in those of painters and sculptors." This method is far cry from the older criticism, which interested itself only in a comparison of the buildings themselves, seeking, in the absence of definite attribution, to establish the authenticity of the work by similarities of style. Here the newer criticism proves its value, since when so much concerning the earlier architects is vague and inconclusive, the possibilities or probabilities of a man's connexion with certain buildings of his time can frequently be determined by personal characteristics of the circumstances of his life.

The popular fallacy that architecture synonymous with decorated construction—that however badly a building may be conceived and planned, architectural merit can be conferred upon it by titivation, is one that Mr. Blomfield has always strongly resented. "Architecture," he writes in "The Mistress Art," is primarily building; the mode of planning and of covering in the space planned, and the manner in which this covering is carried out, the leading idea which conveys, is the essential element in architectural design." Bearing upon the same point, he says, in another passage, "Architecture consists 'in the masterly combination of all the parts, so that they unite in one appeal to the imagination and the emotions. Some such quality as this is believed to be the essential force of architecture, and that which alone justifies its claim to be the most intellectual of the arts. It is a quality which can only be attained by the perfect use of the technique of the art itself; that is, however much architecture may be enhanced by sculpture and painting, should rely on itself to produce its peculiar impact on the senses.'"

"The Mistress Art," as a title, conveys in itself an indication of the rightful position of architecture, for the recognition of which Mr. Blomfield contends. It is once more an appeal for the greater verities of architecture, imperfectly described by the phrase, "the grand manner," which are not concerned with the mere surface tricks and prettinesses of "ornamenting buildings." Quoting Mr. Blomfield again: "Architecture is not cabinetmaking, neither is it goldsmith work, but a grim, intellectual art, moving amid big conceptions, ever brooding over them in the spirit of that strange figure Dürer's 'Melancholia.' Its province is the handling of masses of building, not the dextrous manipulation of detail." In the last sentence Professor Blomfield not only gives the keynote of great architecture, but the reason why so many of our public buildings fall in comparison with those of France and America.

In these few notes on Mr. Blomfield's books we must not forget to mention the first, "The Formal Garden in England," now in its third edition, or the "Short History of the Renaissance in England."

led for students. A further volume was expected from his pen in the autumn, with French Architecture from the reign of Charles VIII to the death of Louis XIV. This will be in two volumes of the size of "Renaissance Architecture in England."

THREE EXHIBITIONS OF STUDENTS' WORK.

The viewing of students' work must in these days be a hopeful and cheering occupation, and by a natural inversion becomes a passing in the extreme. To those who remember the days when students' work hardly to be seen at all outside the Municipal office which gave direction to the student's effort, and formed the only, if not the critical jury of its result, this is a new time, when one may see great visions of directed and more or less finished study, must seem to be the beginning of a new, if inevitable, age. To those men who were familiar with architectural schools in their inception, and the debilitating effect, with Gothic bias, which was their inevitable tendency they now may, to turn to one direction, if not actually to coalesce, must afford some ground of prediction for the future. The fitness of the growth and the process of education, which educational measures on the part of architecture display must, yield one reason to watch it a profound satisfaction, of course, an assured despair. But the observer turns from the progress of the student to the static sameness of its results, and is apt to wonder whether all this pother of reality of any avail, or affords anything more than the fashions of the time. It is really this so if he happen not so long ago to have come himself from one of the schools or to have retained a recollection of such place sufficiently vivid to permit him, in the spirit, to return. For this sort of observer, from this point of view, a survey of the sameness in fundamental character of all shows of students work can but rise to a philosophical sadness—in fine with the spell of hot weather we have ended. He sees men striving after tricks of design as in drawing—if not precisely in fashion of his own day, then in the fashion of this, and no better for that; sees a successful man, as often as not, succeed—never, by reason of an assured facility in drawing and an imitative knack in design; notices in a young student betraying a ready acceptance of the orthodox way, says to himself, "This may evaporate"; sees here and there (for such things do not easily gain admission) a design drawn with difficulty, unusual, *gauche*, atrocious, but showing real, if painful, effort, and says (remembering his student days) and what has happened to which men say "Here there is hope." We give attention to these views, perhaps, as much as a desire to rectify somewhat the natural tendency consequent on early failure or success as from an impulse to enunciate the truth; we feel, however, that so much is not enough, and that to be more particular must be dangerous and of doubtful issue. The Architectural Association exhibition is worthy in that it gives evidence of a change on the part of the governing body to the trend of the teaching dispensed more in the line of the coalescing direction upon which we have remarked. True, there is no trace of any abandonment of the characteristic qualities of the school. The total impression given is still one of smallness, which is yet not precious, of a multitude of pieces which are not, as far as one may judge from the details of some greater entity. The students are encouraged to produce designs the lesser vernacular of the English Renaissance, in the Byzantine style for town houses and in modern "Gothic" for town houses, all doubtless desirable and admirable, perhaps, if it be assumed that these are the things to which the student will actually have to turn. Among the hundred work we noticed two very nicely drawn and complete barns and a small town which was practically the same thing, showing the work of the younger men, designs

for a combined town hall and pump-room of small dimensions were prominent, an excellent subject were it not that one felt that it was set on the principle that a very young man should be put to design very small things, whereas the contrary is more often the judicious way; for it is youth that will embark on an epic in nineteen books, and maturity that may devote a week to the pruning of an epigram. And it is pleasing, therefore, to note that the A.A. school, although it still maintains the characteristics with which it is credited and the policy of which we have never been able entirely to approve, is venturing into the realm of monumental design. There is an Approach to a Municipal Acropolis produced in the first term of the second year, and a design for a Town Library by a third-year man, which sufficiently shows that the venture is likely to be attended with success, as well as a Study in Town Planning of the most arid sort, that indicates that the "human, all too human," teaching of the old régime may give rise to a reaction more dreadful than its cause. But the news that Professor Pite is in future to be associated with the school as far as this side of its activity is concerned induces us to look forward with the greatest interest to the school's development. Those students whose bent is towards large design will work under the best direction, and the A.A. exhibition may in the future be confidently expected to display, as well as examples of the faculty of application to lesser themes, a sense of the concept "architect," of his function as co-ordinator, supreme and focal, of the whole.

Very different from that of the A.A. School is the impression given by the exhibition of the year's work of the students of University College under Professor E. M. Simpson. Here we find coherence, by no means rigid, yet assured. Some allowance should be made for the method of presentation in each case; for the manner of drawing in careful ink and wash and on a uniform size of paper gives the University College show an easy advantage from the outset over the pencil and colour of the other. But, this allowance being made, Professor Simpson's students are seen to be steadily looking to the XVIIIth century and the neo-Grecque for their motives in a way that makes it possible to view their work as that of a definite school. Here there is no "Town-planning" as yet (though a finishing course in monumental design under Mr. J. J. Burnet, A.R.S.A., F.R.I.B.A., is to commence next session), but on a very firm grounding of the Orders, worked into some interesting arrangements of existing examples, there are designs for large houses and town structures (we hope to be able to reproduce parts of a design of the third year of the Degree Course) which show a considerable measure of achievement within the limits of the aim of the school. The movement which is on foot to unite this school with that of King's College may easily enable the University of London to become the chief guardian of the interests of architectural education in the metropolis.

The third school which came under our notice on Friday last was the L.C.C. Central School of Arts and Crafts, which, we regret to say, as far as architecture goes, is unworthy of mention, if not positively deserving blame. But as a necessary corollary of the spread of the teaching of architecture proper this with kindred institutions scattered over London is of very great importance. And this importance must grow, as the technical school continues increasingly to supplant as well as to supplement apprenticeship in the handicrafts. The technical schools are the necessary accompaniment of the architectural schools in the trend of present development and each other's vital complement. One finds in them, as in the architectural schools, that the personal factor is by no means eliminated, as advocates of apprenticeship are accustomed to declare. So far from being lessened, the invaluable factor seems to reach a higher potency, even in an institution as bureaucratic as a school of arts and crafts may become. In the case of the Central School, for instance, offering curricula much the same as many another, the lettering, written, carved, painted, or printed, stands out as something of unusual

sanity, thoroughness, and charm as compared with the other exhibits, which, though of sound merit, were very like the things that other schools of the same kind display.

THE ARCHITECTURAL ASSOCIATION.

THE annual exhibition of students' work was opened on Friday, the 21st inst., at No. 18, Tufton-street, Westminster, S.W. It comprises a large selection of drawings made by the pupils in the first, second, third, and fourth years (see p. 97). A large company of relatives and friends of the students attended during the afternoon, and the President (Mr. Gerald C. Horsley, F.R.I.B.A.) read the list of awards and prizes, as follows:—

First Year's Awards.

First place in History Test Paper: H. J. H. Dicksee.
First place in Construction Test Paper: H. J. H. Dicksee.
First place in Geometry: H. J. H. Dicksee.
First place in Physics: H. J. H. Dicksee.
First Place in Freehand Drawing: E. C. Davies.
Best Portfolio of Drawings: H. J. H. Dicksee.
Hon. mention: R. S. Wallace, E. C. Davies, H. G. Satchell, and E. Hayman.

Second Year's Awards.

Travelling Studentship for Studio and Lecture Work: D. J. Gordon.
Hon. mention: T. W. Dowsett, C. M. Cooper, G. Fildes, and C. G. Ripley.

End of Session Test.

First: D. J. Gordon.
Specially commended: T. W. Dowsett, Stanhope Bennett, and C. F. Aldous.

EVENING SCHOOL.

Preparatory Course.

Scholarship: E. Kennedy Smith.
Book Prize: J. B. M. Walsh.
Master's Prize: J. A. Hale.

Third Year.

Scholarship: A. B. L. Roberts.
Book Prize: G. W. Stuart.
Master's Prize: T. F. Ford.

Fourth Year.

Travelling Studentship: H. V. C. Curtis.
Book Prize: F. A. Crouch.
Master's Prize: F. A. Crouch.
Mr. Gerald C. Horsley, F.R.I.B.A. (President), Mr. H. P. G. Maule (headmaster), Mr. W. Robert Colton, A.R.A., and Sir Aston Webb, C.V.O., C.B., R.A., addressed the visitors and students.

Appointment of Professor Beresford Pite.

The President announced that Professor Beresford Pite, F.R.I.B.A., had been appointed Director of Education in the school. Professor Pite will have under his care especially the third and fourth year students in the evening school, while Mr. H. P. G. Maule will continue to act as headmaster of the day school. Mr. Maule, assisted by Mr. C. E. Vardell, A.R.I.B.A., will co-operate with Professor Pite in the general direction of the work of the school.

THIRD SUMMER VISIT.

On Saturday, July 22, a good attendance of members endured a very hot journey and walk from Sevenoaks Station in order to enjoy a visit to Knole House. The history of the present building commences practically with the ownership of Thos. Bouchier, Archbishop of Canterbury, during the Wars of the Roses. He purchased the estate from Sir William Fiennes, Lord Saye and Sele, in 1456, and rebuilt the house, large portions of the present work dating from his ownership, though often overlaid by Elizabethan and later additions. The archway from the outer or Green court to the Stone court, with the charming oriel window and machicolated parapet above, are the most conspicuous external features of this date. Bouchier's successor, Cardinal Morton, Chancellor to Henry VII, and originator of the celebrated paradox known as "Morton's Fork," also spent great sums on the house, which had been bequeathed by Bouchier to

the see. Warham and Crammer were often at Knoles, which frequently entertained the King, to whom the property was surrendered by Crammer in 1537. He is said to have built the chapel. In 1603 Thomas Sackville, afterwards first Earl of Dorset, came into possession by grant from Queen Elizabeth after the termination of certain leases. The estate had been previously granted by the Queen to Dudley Earl of Leicester, who, however, restored it to her. Sackville added the buildings on either side of the gateway tower on the north-west front. The direct line becoming extinct, the earldom lapsed, but the property continued in the family, the present owner being the third Baron Sackville.

Such a great rambling house as Knoles would require days to see and appreciate properly, and only the most cursory inspection was possible. Crossing the Green court and the Stone court, the great hall is entered beneath a colonnade of widely-spaced stone columns supporting the wooden entablature and balustrade of a wide balcony bearing the date 1748 on one of its dies. The hall is a lofty apartment, with a flat ceiling enriched with rather angular ribs and small pendants. A good heraldic screen with minstrel gallery over may be dated by the arms about 1603. Some very beautiful steel firedogs formerly belonging to the Boleyn family were greatly admired. The main staircase, of typical Elizabethan form, in short, straight flights with figures on the newels and arched screen on the first-floor landing, is approached from the dais end of the hall. The ballroom is finely panelled in oak elaborately carved and painted white. It has also a fine ceiling of later type than the hall, in which the ribs have flattened and widened to receive modelling. The marble chimneypiece in this room is one of a very fine series, considerably above the level of design usual in the Elizabethan style; an uncommon feature is the engraved pattern on the lintel. The crimson drawing-room or Reynolds room also has a good ceiling, and a chimneypiece in which the termes have bronze heads and feet. In the cartoon gallery is the well-known ceiling with the wavy pattern resembling net tracery. Another fine chimneypiece and a charming bay facing it add to the attractions of this beautiful apartment. The pictures everywhere are good, but three splendid Holbeins and a fine Tintoretto here call for special remark. James I.'s bedroom, containing a magnificent collection of furniture and silver, has a ceiling of different form and very interesting design. It consists of a series of square panels, each enclosing a modelled wreath. From the corners of the squares and within the wreaths are very delicately-worked sprays of foliage—a charming and not too hackneyed treatment. The remaining rooms were apparently of earlier workmanship and partly of timber construction, including a series of oriel windows. These rooms have very simple chimneypieces with moulded jambs having fanciful steps, and unusually well-designed Arabesque carving on the rather deep lintels. A billiard table, of which the legs and frame date from the days of Charles I., attracted much interest. A room adjoining this wing, known as the Venetian Room, is said to be decorated by Inigo Jones. It is a quiet and refined piece of work, with a good Venetian window and simple chimneypiece, but certain tricks of detail rather suggest a later designer—possibly Kent. In the chapel a triptych was seen which was said to have been presented by Mary Stuart, to the Earl of Dorset on his conveyance of the knowledge that her death warrant had been signed by Queen Elizabeth. The exterior of Knoles is inclined to be austere, but its brick chimneys and fanciful lead rainwater heads give it great interest.

MILNTHORPE MAIN SEWERAGE.

The South Westmorland Rural District Council have had under consideration for some time the question of sewerage of the village of Milnthorpe. In years gone by it was a noted coaching centre, being on the London and Carlisle main road. The District Council have now instructed Mr. Harry W. Taylor, A.M.Inst.C.E. (Messrs. Taylor & Wallin), of Newcastle-upon-Tyne and Birmingham to consider and report to them as to the best and most satisfactory means of dealing with the sewage of this town.

[Photo, Lewis.]

Branch Library, Monkwearmouth, Sunderland.

Mr. Edward Cratney, Architect.

BRANCH LIBRARY, MONKWEARMOUTH.

The building has been planned with a view to working the Library with as small a staff as possible. The principal rooms are grouped round the entrance-hall, which gives access to all parts. The delivery counter is so placed that the Librarian has direct supervision of all the main rooms.

The Library is arranged on the "safe-guarded" open-access system. The walls are built of Withnell bricks, with Spingwell stone dressings, and the roofs are covered with green Westmorland slates. The floors of the main rooms are laid with maplewood blocks. The whole of the woodwork in the main rooms and the interior fittings are of oak.

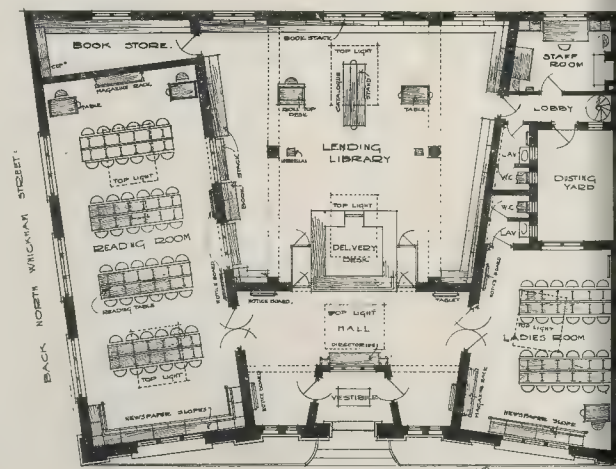

The building was designed by and carried out under the supervision of Mr. Edward Cratney, architect, Wallsend-on-Tyne. The contractor was Mr. Joseph Huntley, of Sunderland. The carving was executed by Mr. Christian Neuper, Newcastle. The delivery desk was furnished by Messrs. Robson & Sons, Newcastle. The whole of the fittings and furnishings were carried out by Messrs. Laidler Robson, Ltd., Sunderland, to the designs of the architect. The heating system, hardware, and entrance gates were carried out by Messrs. Emley & Sons, Newcastle. Mr. T. Cooke, Sunderland, was clerk of works.

THE ROYAL SANITARY INSTITUTE CONGRESS.

The twenty-sixth Congress of the Royal Sanitary Institute opened at Belfast Monday, when upwards of 750 delegates members attended from all parts of the United Kingdom. The Congress was inaugurated by a luncheon in the City Hall presided by the Lord Mayor of Belfast, who was supported by the Lord Lieutenant of Ireland (the Earl of Aberdeen), Sir Henry Tait, F.R.I.B.A., Messrs. John Slater, F.R.I.B.A., H. D. Searles-Wood, F.R.I.B.A., E. T. H. F.R.I.B.A., W. Kaye Parry, F.R.I.B.A., H. Percy Boulnois (Chairman of the Council of the Institute), E. White Wallis (Secretary).

Exhibition.

Subsequently the Lord Lieutenant of Ireland opened the Health Exhibition held in connexion with the Congress. One of the chief features of this was the City Town Planning Exhibition arranged by Professor P. Geddes and Mr. F. C. Mears. Exhibition was, as far as possible, representative of the contemporary movement of town planning and city improvement. As regards suburban developments, it presented a series of plans, photographs, etc., illustrating the leading types of garden villages, garden suburbs in this country and abroad. A similar series indicated the more important central improvements of streets, boulevards, etc.

Branch Library, Monkwearmouth, Sunderland.

Mr. Edward Cratney, Architect.

and so on in the leading capitals and important cities. In conjunction with these, fully-prepared series of exhibits and models outlined the essential procedure of methods of town planning and city improvement in Germany, England, Scotland, Ireland.

Amongst the firms who exhibited were the Messrs. T. Parsons & Sons, 10, Pall-mall, London, showing paints, glazes, and enamels; the Hygienic Confection and Portable Buildings, Ltd., 1, Queen-street, E.C., with models of buildings supplied to different authorities for their purposes; W. D. Henderson & Sons, Belfast, with all kinds of builders' materials, general fireproof goods; the Albemarle Company, Ltd., Milverton-street, Kennington, showing specimens of "Albemarle" or Portland marble for wall covering; Heenan & Co., Ltd., Manchester, showing models of destructors; the British Sanitary Company, of Glasgow, with various types of closets; the Middleton Fireproof Works, with glazed bricks and buff building stones for facing public buildings; the Albemarle Company, with their various disinfecting preparations; George Howson & Co., Southampton-road, with a large exhibit of chain baths, sinks, lavatories, etc.; the Albemarle Company, Shirlingshire, with porcelain lavatory stands, etc.; D. Anderson & Co., Ltd., Ford, E., who showed the "O.P." washable water-paint; and Mr. W. P. Dibdin, who showed a section of the original slate bed invented by Mr. W. P. Dibdin.

Presidential Address.

A reception held on Monday evening at the Dunleath delivered his presidential address. Having spoken in high terms of the progress in health matters made in Belfast, he considered some aspects of sanitary administration of more general application, and placed at the sanitary conditions of our towns and some sixty or seventy years ago. Since then, he said, every municipal authority worthy of the trust committed to it had exerted itself by constructing an efficient system of drainage, by the clearance of insanitary dwelling-houses, by the removal of dirt from the streets and from the houses so as to purify the air which the people were breathing, whilst municipal authority worthy of its post had provided an ample supply of the water which it could obtain from the most possible sources. Having shown how these efforts had been reflected in the death-rate, he pointed out that the conditions of many of the smaller towns and villages demanded the most serious attention for sanitary reform, and urged that the opinion should be freely exercised on backward communities.

Sewage Purification.

That interest was manifested in the discussion which took place on Tuesday, July 18, on the subject of Sewage Purification. Discussion was opened by Dr. Rideal, who complained strongly of what he described as the "wait-and-see" principle of the recommendations of the Royal Commission on Sewage. He contended that in the future all sewage must be purified before being discharged into river waters, and that sedimentation was not purification. The two great objects to be got rid of were aerial nuisance and pathogenic organisms, and these were not removed by sedimentation, although they were by sterilisation. Mr. Watson (Birmingham) severely criticised the flippant attitude in which Dr. Rideal had dealt with the matter, and maintained that the finding of the Royal Commission that every case must be treated on its merits was the only sound principle of dealing with the matter. Mr. A. P. I. Brill (Bristol) and Professor Letts (Bristol) upheld the view of Mr. Watson, and latter instanced the case of Birkenhead, Liverpool, which were able to discharge treated sewage into the Mersey without ill-effects, whereas Colchester, which was a tidal river, but with a very slow flow, had to resort to a complete scheme of purification. Mr. Kaye Parry, on the other hand, thought it was necessary for the Royal Commission to lay down what they really meant by purification, as he did not consider sedimentation was purification. Consequently, a resolution proposed by Mr.

W. H. Williamson (City of London) was considered, to the effect that steps should be taken to secure a permanent stoppage of the existing evils of sewage pollution caused by the discharge of crude sewage in rivers and estuaries.—Mr. A. E. Prescott (Borough Engineer, Eastbourne), Mr. J. Powell (Staffordshire County Council), Mr. Munce (Belfast), Alderman Mattison (Middlesex-borough), Mr. H. G. Whyatt (Borough Engineer, Grimsby), and others took part in the discussion, and the opinion was freely expressed that it was impossible to apply a general rule to all cases, inasmuch as local conditions varied so considerably. Eventually the motion was withdrawn.

GENERAL NEWS.

Professional Announcements.

Mr. William Hunt, J.P., L.C.C., Donington House, Norfolk-street, Strand, W.C., architect, has taken his son, Edward Arthur Hunt, into partnership, and the work and business of the office will be continued under their joint personnel. Mr. William Hunt has been in practice for many years in Norfolk-street. Previous to his removal his offices were in Adelphi at Adam-street and York-buildings. Mr. Edward A. Hunt served his articles with his father, whom he now joins as partner. Their names have been jointly associated with several buildings lately erected, some of which have been illustrated in *The Builder*.

The offices of Messrs. J. W. Simpson, F.R.I.B.A., and Maxwell Ayrton, A.R.I.B.A., 3, Verulam-buildings, Gray's Inn, W.C., will be closed from August 7 to 21, both days inclusive, for the annual staff holidays. Arrangements will be made as usual for dealing with business referring to all buildings in actual progress.

Appointment.

Count Plunkett, H.A., R.I.B.A., has been unanimously elected President of the Museums Association for the year 1911-12.

Honour for Mr. J. W. Simpson.

We hear that Mr. John W. Simpson, Vice-President of the Royal Institute of British Architects, has received from the French Ambassador the brevet of Officier de l'Instruction Publique, which has been awarded to him by the Minister of Public Instruction and Fine Arts for services rendered to French art.

The King Edward Memorial.

A meeting of the Executive Committee of the King Edward Memorial Fund was held at the Mansion House on the 21st inst., when it was resolved not to submit to public competition the commission for the West-end Memorial, but to associate an architect with a sculptor in the preparation of suitable plans and designs. Finally, it was decided to invite Mr. Bertram Mackennal, A.R.A., as sculptor, and Mr. Edwin Lutyens as architect to prepare and submit to the Committee plans and designs for a statue of King Edward at the Piccadilly end of the Broad Walk in the Green Park. The questions of a memorial in the East-end and of utilising for other purposes any balance which may remain after the two Memorials have been provided were left over for further consideration.

Church Restoration.

The Twenty-second Congress of Archaeological Societies in union with the Society of Antiquaries (London), recently held at Burlington House, under the presidency of Dr. C. H. Read, F.S.A., unanimously carried a rider, moved by Mr. P. M. Johnston, F.S.A. (Sussex), to the Council's resolution to the effect that the position of the Society of Antiquaries in advising diocesan authorities in respect of church restoration, should be strengthened by the grant of additional powers through the Royal Commission on Ancient Monuments (England), and recommending the appointment of the Society as the advisory authority for England and Wales in all matters pertaining to the furniture, fabric, and monuments of churches. Mr. Johnston's rider related to the recent appointment by the Sussex Archaeological Society of a special committee to watch over the ecclesiastical antiquities of Sussex, and asked the Congress to commend a similar course of action to the consideration of other local archaeological societies.

Fotheringhay Castle.

The Peterborough and District Archaeological Society have made excavations about the mass of worked stone, lying by the left bank of the Nene, which is the only remains *in situ* of the fabric of Fotheringhay Castle. The mass of stone fell, it is said, from the keep on the mound. An examination shows that it is the backing of a fragment of tooled and weather-worn Barnack ragstone from it is supposed, the outer wall of the keep at its junction with the south bastion; the masonry also presents an inner obtuse angle with a complete plinth. The relic has been erected vertically in what is believed to be its original position. Edmund of Langley, fifth son of Edward III., rebuilt Simon de Liz's castle, and planned the keep in the shape of a fetterlock. He had acquired it from Mary of Valence, Countess of Pembroke; it afterwards passed to Elizabeth of York, consort of Henry VII., and then in dower to Queen Katharine of Arragon. The vulgar error that James I., moved by filial piety, pulled down the castle is refuted by the fact that he bestowed it upon Lord Mountjoy and two others, as well as by a survey made on April 3, 1625 (a few days after the King's death), which specifies the chapel, the hall on the first ascent, the keep, the great dining-room, with several other buildings, the two ditches, etc. The moats and outworks may still be traced; the central mound remains. Authentic views and plans are very rare; the interior of the hall since rebuilt at Cunningham—is depicted in the "memorial" whole-length portraits of Mary Queen of Scots, lent to the Stewart Exhibition, 1889, by Queen Victoria, Lord Darnley, and Blair's College, Aberdeen. In the background of each is represented the execution of sentence upon Queen Mary with a view of the interior of "Avla Fotheringham." In the "Talbot" Inn, Oundle (illustrated in the *Builder*, December 3, 1898), are a staircase and some stonework from Fotheringhay Castle.

Property Sales.

Trentham Hall, in Staffordshire, formerly a seat of the Dukes of Sutherland, which was lately offered to the federated borough of Stoke upon-Trent, has been disposed of to Messrs. Young & Son, of Longton, and the mansion, the two side wings excepted, will be pulled down. The early XVIIIth-century house was altered by Holland for the Duke of Sutherland, and Sir Charles Barry carried out an extensive scheme of enlargement and improvement. L. Brown laid out most of the grounds, and Barry the gardens. Of properties recently placed in the market we may mention the Upper House Court Estate, Womersley, Surrey, with the XVIIIth-century manor house to which Mr. R. Norman Shaw, R.A., made extensive additions; Buccleuch House, the well-known riverside house at Richmond, formerly occupied by the Dukes of Buccleuch; New Synagogue, with adjoining buildings, on a site of 12,800 ft. super. in Great St. Helen's, E.C.; Piccadilly-arcade, with Empire House, Piccadilly, and Brunswick House, Jermyn-street, comprising offices, chambers, and twenty-eight shops, as recently erected after Mr. Thrale Jell's designs, upon the sites of Nos. 174-5-6, Piccadilly, and Nos. 52-3 (the Brunswick Hotel), Jermyn-street; Nos. 47-8, Dover-street, Piccadilly, rebuilt as Premier House, from Mr. G. D. Martin's plans and designs ten years ago; Falcon-square Congregational Chapel, Silver street, with Nos. 1-2, Windsor-court, E.C., of which the trustees propose to effect a sale at the price of 9,000*l.*, failing a higher offer; and Bear Wood, Berkshire, extending over 3,000 acres, the seat of the late Mr. Walter, of the *Times*, for whom the mansion was built by Professor Kerr.

Geological Survey, Great Britain.

A summary of progress of the survey of Great Britain, 1910, is published by the Board of Agriculture and Fisheries. For England and Wales the work has been begun in the London and south-eastern districts for the first time upon the 6-in. scale, and in the Warwickshire, Flintshire, and Denbighshire districts, with special attention to the formations that lie over the coal measures, and to the visible coalfields. For Scotland, the original survey has been continued in the West Highlands, with Mull and South Morvern, and in parts of the counties of Inverness, Sutherland, and Perth in the North and Central Highland District.

COMPETITION NEWS.

Wallsend School.

Messrs. Marshall & Tweedy, of Newcastle-on-Tyne, have been awarded the first premium (304.), and Mr. Edward Cratney, of Wallsend, has received the second premium (204.) in the competition for a new elementary school, Wallsend. The assessor was Mr. A. W. S. Cross, F.R.I.B.A. The accommodation provides for 1,440 children in three departments; also cookery, manual, and dining room for children, caretaker's residence, and three classrooms for domestic subjects. The whole of the schools are single-story buildings, and embody the latest requirements of the Board of Education with respect to central halls and the better ventilation and isolation of classrooms.

Messrs. Marshall & Tweedy were also successful in securing the first place in the competition last year for new schools for the Northumberland County Council erected at Whitley Bay, and were architects for the King Edward Schools opened last year. They have recently been appointed architects for a new school for the Durham County Council to be erected at Greencroft for 900 children, the plans of which will be prepared on similar lines to the Wallsend School.

Northampton Secondary School for Girls.

The Higher Education Sub-Committee of Northampton Town Council have received a report from Mr. James Osborne Smith, F.R.I.B.A., Old Queen-street, Westminster, S.W., assessor in the competition for the erection of a secondary school for girls. In his report he states that he examined the twenty-two sets of drawings and particulars submitted, and after careful consideration of the merits and demerits of the different designs, he had arrived at the conclusion that plan No. 15, from Messrs. Sharman & Archer, Wellingborough, came first; No. 2, from Messrs. Talbot, Brown, & Fisher, Wellingborough, second; and No. 10, from Messrs. Gotch & Saunders, Kettering, third; while designs Nos. 19 and 20, from Messrs. H. H. Dyer & Son, Northampton, and Messrs. Talbot, Brown, & Fisher, Wellingborough, respectively, followed in order of merit. Mr. Smith then goes on to say, with regard to the designs as a whole, that they fell short of that standard of compactness and economy in planning which it is possible to obtain, and in all the five sets of the plans above mentioned it would be possible, without materially affecting the design, to introduce economies which would also be in the nature of improvements. In no case, he says, does the best use appear to have been made of the varying levels of the site. In most of the designs the gymnasium cannot be regarded as altogether a satisfactory room. In his report on the successful design the assessor writes as follows:—"No. 15 shows a good plan with an excellent assembly hall and an economical provision for future extension. The classrooms, domestic science room, domestic offices, cloak-rooms, lavatories, etc., are well arranged; the position of the gymnasium is, however, open to criticism, as are also the staircases and the lighting of art rooms. While the glass area has not been sacrificed for external effect, the treatment of the front elevation is distinctly good and in character with the use of the building." In conclusion, Mr. Smith states that the authors of the five designs mentioned have produced very carefully prepared drawings, indicating serious and intelligent efforts to satisfy the requirements of the undertaking. The Sub-Committee are to publicly exhibit the designs submitted.

THE ROAD BOARD AND NEW ROADS IN THE ENVIRONS OF LONDON.

The Board are about to proceed with the scheme for making a new road from Chiswick to Hounslow, passing to the north of Brentford, in lieu of their non-acceptance of the Brentford District Council's project for a widening of the High-street, Brentford Town. Steps will be taken to construct a "by-pass" road for Croydon, from near Thornton Heath, through Waddon to the west, and re-entering the main road at Purley. In this connexion it is interesting to refer to the report of the Traffic Branch of the Board of Trade, reviewed in our issue of March 10, pages 290 et seq.

CORRESPONDENCE.

Gidea Park Exhibition.

SIR,—Your correspondent refers to the Gidea Park Exhibition as a "revolutionary competition," and seems to think it is so in the sense of lessening the extent to which the architects' services will be required in future.

In my judgment the competition is "revolutionary" in quite another sense, in that it will tend, I believe, to bring the services of the architects much more into requisition than ever before.

The real significance of this competition to the architectural profession lies in a fact which your correspondent ignores.

The growth of London eastwards, and, in fact, in every direction, has, in the last ten years, proceeded with extreme rapidity, and hundreds of thousands of houses have been built in the outer suburbs with a minimum of architectural assistance.

The garden-suburb movement is tending to revolutionise the relations between building owners and architects.

In three years we have seen a quarter of a million poundworth of buildings erected at the Hampstead Garden Suburb, 90 per cent. of which have been designed by qualified architects. At Gidea Park the same effort is being made to secure architecturally-designed and properly-built houses for the ever-increasing population of Outer London.

Your correspondent raises the question whether it is desirable under any circumstances for the architect to invest in the house which the architect has designed.

Since the first Cottage Exhibition, held at Letchworth in 1903, there have been a good many competitions, mostly held under the auspices of the National Housing Council, in which actual building has been necessary to qualify a competitor. This was the case at the Sheffield Exhibition in 1907, Newcastle Exhibition in 1908, and the Swansea Exhibition in 1909.

All these competitions had one feature in common—that the expense of organising the Exhibition, amounting to a substantial sum, was not borne by the exhibitors, but by the proprietors of the Exhibition, and the same is the case at Gidea Park.

The promoters of the Gidea Park Exhibition are engaged in the task of educating the public to the view that it is desirable for the man in the street to live in the house which the architect has designed, and whatever the financial results of the Exhibition may be to the owners of the estate, it is obvious that the architectural profession will benefit as much as any class of the community by the success of their efforts.

I hope your correspondent will recognise these facts, and that his letter will not discourage owners of large estates from following the public-spirited policy pursued at Gidea Park.

Wm. THOMSON.

Chairman of the National Town Planning and Housing Council.

SIR,—Our attention has been called to Mr. Maurice Webb's letter appearing in your columns of the 21st inst.

We are not concerned with the writer's views as to the conditions under which architects have for some years, at Letchworth, Sheffield, Newcastle, Swansea, Gidea Park, and elsewhere, taken part in competitions which involved actual building either by the architect or a competing builder. We must, however, express our regret that Mr. Maurice Webb should have made references to the position of Gidea Park, Ltd., which are wholly inaccurate and which must have been written without any inquiry on his part as to the facts.

His letter would suggest to the uninformed that Gidea Park, Ltd., has sought to make substantial profits out of the competitors in the House and Cottage Exhibition now being held on part of their estate, has, to use his own words, "charged competitors at the rate of over 3,000l. per annum for trifling services."

That there is no foundation for these most improper suggestions the following plain statement of facts will show:—

The Exhibition in question is (except as to a few isolated houses) being held upon

34½ acres, forming part of 500 acres, of land adjoining Squirrels Heath and Gidea Park Station on the main line of the Great Eastern Railway.

These 34½ acres adjoin Raphael Park, to the west and the Romford Golf Course to the east, and were acquired by the company in autumn on the basis of the then value as fixed by the Government valuation at 10,447l.

For the purpose of the Exhibition the company made and sewered the necessary roads and laid out open spaces and provided facilities for building traffic at the following approximate outlay:—

Accounts rendered to date.....	£11,386
Estimated cost of completing roads	1,000
Total.....	£12,386

This cost does not include any sum in respect of access roads or connecting sewers outside the Exhibition area.

The total cost of land, roads, etc., therefore stands at 22,835l., and the land was prior to exhibitors at the total sum of 25,821l., leaving a gross profit, if all plots were disposed of, of 988l., or less than 5 per cent. This, however, does not represent any profit to the company. In the first place the company proceeded to reserve as a permanent open space 90 acres of the golf course immediately adjoining this land, the cost of which was approximately 15,000l. Nothing was added to the price of the plots in respect of this open space.

The company further voluntarily expended upwards of 3,000l. in advertising the Exhibition, and 1,400l. was expended in prizes and judges' fees. Nothing was added to the price of the plots or charged to competitors in respect of this outlay, or in respect of the company's general expenses incurred in connexion with the Exhibition; 121 plots were disposed of to competitors at the capital price of 16,279l. 10s. 10d.

Our clients, Gidea Park, Ltd., hope in the future to show that an enlightened policy in town planning, and the employment of the best professional assistance in building houses is not incompatible with dividends, but venture to think that the above figures make it clear that they have neither made, nor sought to make, any profit at the expense of anyone who co-operated with them in creating the House and Cottage Exhibition.

Mr. Webb's specific statement that the company have charged competitors 5s. for opening and shutting the Exhibition houses is incorrect. The company have performed this service entirely free of charge.

His statement that the company has charged at a rate of over 3,000l. per annum for trifling services is simply ludicrous.

The facts are as follows:—

For the convenience of a few competitors the company undertook to engage workmen to clean their houses and water their gardens. The company has performed these services for twenty-eight competitors only, and at a receiving in all 7l. 11s. per week, which, services are required until the end of the Exhibition, may amount to about 100l. Of this sum the wages of three men and three women and the cost of garden hose and supervision, etc., have to be paid, which will leave, and was not intended to leave, a substantial sum to set against the Exhibition expenses of the company.

So far as Gidea Park, Ltd., is concerned Mr. Webb's unfounded suggestions would have been passed over in silence, but the informed criticism of this kind, if uncontradicted, might result in injury to the builders and architects who have at great trouble co-operated to make the Exhibition the remarkable success which it is to-day.

DURHAM, CARTER, & DURHAM,
Solicitors to Gidea Park, Ltd.

SIR,—May I, as an Associate of the Institute, express my absolute agreement with the sentiments of your correspondent, Mr. Maurice Webb, M.A., as far as concerns the undesirability of the conditions of the Gidea Park Competition?

I must, however, protest against his expressions concerning the "anathy of the powers that be," not because I disagree with them, but because I feel that they should not come from a non-member.

If those architects of the younger generation who are not members of the Institute would come into line and help those of us who have on occasion tried, from within, to nip the slothfulness complained of, we might have some chance of success, but so long as a large number of our contemporaries are too apathetic themselves to take the trouble to become members, they have no right to complain of the misdoings of a body in which they have neither part nor lot.

Recent criticism, both of the Council and those who have disagreed with the Council, has far too frequently come from architects who have, by their own action or lack of action, deprived themselves of the right to complain, and from whom suggestions would be fittingly come in the form of letters to the Council of the Institute direct than by means of gites in the Press.

WILFRID TRAVERS.

SIR,—I am entirely in sympathy with the view of your correspondent in the last issue of your paper as to the desirability of some announcement from responsible quarters as to their attitude towards these competitions. It was not one of the competitors, successful or unsuccessful, and have no personal bias in the matter. But I feel very strongly that on the professional point of view competition on these lines ought to be discouraged. In the first place, their tendency must inevitably be in the direction of putting a premium on the cheapest form of building, while economy in planning is a thing to be encouraged, there is surely a point at which cheapness in execution ceases to be a virtue. With so many able architects competing, the comparative margin in the first instance is reduced to a minimum; as to the stress of such keen competition on the margin between profit and loss to the building owner or contractor must often be seriously near the border-line. Is it, then, a good thing for the profession at large, or for the competing architects, to be constantly confronted by clients with the published results of the efforts of architect and builder designed and executed under such special circumstances? I ask with shyness, having suffered more than once by such "confrontations."

My second point is merely an amplification of the main contention of your correspondent's letter: that the architect weakens his position of professional detachment when he enters the dusty arena of competitive commercial speculation or attempts to combine the business of a builder and the agent with his own. It is not improbable that this competition will be succeeded by others on the same lines. The large King's College estates at Northwood and Ruislip, for the laying-out of which an admirably-conducted competition is recently instituted on the usual lines, will soon be developed. In the event of the promoters deciding on a public competition, we may assume that their aim, in common with that of the organisers of the Gidea Park exhibition, will be to avail themselves of the best designs obtainable and to combine them with good building—not merely to offer their estate by exploiting young architects or trading on their difficulties in getting their names before the public. Surely the best way to attain their object would be to institute a competition for designs for a limited number of houses on those portions of the estate which it is desired to develop, and to erect those houses at their own expense! Under these conditions they would doubtless have the support of the profession as a whole.

GERVASE BAILEY.

SIR,—The letter from Mr. Maurice Webb published in your last issue raises many points of importance. But most immediately of interest is the suggestion that the competitors have been unduly exploited in the interests of the promoters of the competition. We have no means of knowing upon what speculation of profit the developing company have based their calculations. They may be moderate or not. But, as competitors, it is, I think, due to the company to have it said that the conditions and risks of the competition have been perfectly clear from the

outset, and competitors have entered it of their own free choice.

The charges for caretaking houses and gardens were obviously high, or not according to the thoroughness of the work done. But this, and the question of agency charges, are little to the point, as all competitors have been free to make their own arrangements in such matters, and probably most of them have done so independently.

In these circumstances it can, in our judgment, only have an effect prejudicial to all concerned to raise animus against the promoters of the competition. The venture hangs in the balance and will, we do not doubt, be successful. But to that end it is of the greatest importance that the houses built should be quickly occupied. If, eventually, some feel themselves entitled to consideration, it would surely be better, at any rate in the first instance, to state a case to the company rather than, by promoting recriminations in the public Press, to prejudice their own as well as the company's interests in this novel experiment. Certainly, if results in this competition are to affect it, it is, as yet, much too early to say what the attitude of our profession should be towards similar competitions in the future.

Meantime, as many as possible of the houses erected at Gidea Park should be offered at a reasonable rent, so that hesitating purchasers may have time to make up their minds and their natural reluctance to be the first to be tied to a new and unoccupied suburb be overcome. ERNEST WILLMOTT, F.R.I.B.A. H. S. EAST. A.R.I.B.A.

Manchester Library and Art Gallery.

SIR,—Although I did not send in a design for the above building, yet, having closely followed this important competition and the controversy consequent on same, I desire to make "three" practical suggestions as to how the Corporation can be extricated from the situation that has arisen, with dignity to themselves and with justice to the many competitors:—

1. Each competing architect should be invited to re-submit his scheme, and to sign a document (duly drawn up by our Town Clerk) stating that the drawings and report as returned are the actual ones previously submitted, without alterations of any kind.
2. Each of the authors of the ten schemes already premiated should be allowed the 100 guineas to defray the cost of their developed drawings as far as they have proceeded with them.
3. That our Corporation should appoint "three" adjudicators—all men of unquestioned experience in the planning of public buildings of this character and size—and definite instructions be given them that no scheme which infringes the conditions of competition, particularly as to the cost and area of land to be built on, shall be considered. These three "experts" should then make their deliberate choice of the most suitable design from the whole of the sketch drawings re-submitted (which are quite sufficient for the purpose). The result should be accepted as final, the whole of the schemes being publicly exhibited, and the carrying out of the work placed in the hands of the successful architect.

If this procedure be adopted, justice will be done to all who have spent so many weeks of time and labour in formulating their schemes, and what in the eyes of the Manchester public is equally important, the best and most appropriate design for the purpose undoubtedly will be secured.

I earnestly commend my suggestions to the careful consideration of those who have the welfare and good name of our old city entrusted in their hands.

ANOTHER MANCHESTER ARCHITECT.

King Edward VII. Memorial.

SIR,—Adverting to your observations on the above, which, it is announced, is to be placed at the unsuitable Piccadilly situation, may I venture to ask whether the circular sunk garden, with a small fountain in the centre, between Stanhope and Grosvenor Gates, at the Park-lane side of Hyde Park, has been considered as a suitable site? It would appear to present less objections than the one now chosen. W. A. A.

Hyde Park Corner.

SIR,—In face of the announcement which has been made to the effect that a combination is prepared to give a million sterling for the site of the St. George's Hospital in order to erect thereon a new hotel, may I renew a proposal I made more than two years ago?

At that time Colonel J. Charlton Humphreys had just acquired the freehold of the Knightsbridge estate, and now very shortly the houses in Trevor-square, and, indeed, the property on the whole estate will be taken down. Not only are new buildings to be erected, but new road planning is proposed.

Here is a quiet spot in close proximity to Hyde Park Corner, an ideal site to which the St. George's Hospital might be transferred from the extremely valuable, but, for the purposes of a hospital, most unsuitable site it now occupies.

Such a change would, at one stroke, advantage a great public charity and make available the unique site at Hyde Park Corner, in many ways the most conspicuous in the Metropolis, for an opera house or other building of a like character.

It can only be a question of time when the hospital will be removed, and the site offers such opportunities for a public building that it would be a thousand pities for it to be acquired for the purposes of an hotel.

MARK H. JUDGE.

Questions for Builders.

SIR,—“Experto Crede’s” letter deals adequately with “Builder’s Manager’s” points. In a word “Experto Crede” emphasises an economic truth: the builder must be outbalanced in these days of organisation unless he seriously works for adjusting conditions so that he is not outbalanced—that is, for organisation of available forces for the builders’ cause. For this some amount of sacrifice is a *sine qua non*, mostly of personal free-lance proclivities.

Many influences are in motion to give insecurity to firms of known probity, and, without analysing them, it is to be hoped that all concerned will act now on the hint “Experto Crede” has given. Surely no emphasis is needed! He speaks gospel. SURVEYOR.

Shrinkage of Joinery in Hot Weather.

SIR,—I have read with much interest Mr. W. F. Wallis’s letter in your last week’s issue of the *Builder*, and wish to bear out his remarks entirely. I am sure the majority of builders have at some time or other experienced similar cases. I myself had some houses built in the country four or five years ago, and the joinery, generally, stood very well, with the exception of a few slight unavoidable shrinkages here and there. This joinery work has since been “stopped” and repainted about twelve months ago, and it looked first-class, with no sign of any shrinkages whatsoever, until just recently during this very hot weather some of the joints have opened a little, not much, but enough to show there has been a further shrinkage even after all this time, which is unaccountable; therefore (which perhaps is rather departing from this question) it is really wonderful any joinery can stand at all under the extraordinary conditions under which it has very often to be placed in quickly-constructed buildings, not forgetting that, in the winter, in many instances, radiators are inadvisedly used directly after all the joinery is fixed to warm the buildings and before they are dry, which must also affect the joinery; in fact, my experience is that the drier the material of which the joinery is made, probably the more shrinkage when fixed in a wet building. JAMES F. PARKER.

INTERCOMMUNICATION COLUMN.

Rainwater “Tipper.”

SIR,—Can you or any of your readers kindly inform me where I can obtain an automatic “tipper,” which excludes the first portion of rainwater, rendered dirty by roof, and directs the remainder into the cistern?

I have heard of such an arrangement, but cannot find any reference to it in the ordinary catalogues. CLERK OF WORKS.

EDITORIAL SUMMARY.

Our leading article deals with Professional Unity, being suggested by the recent correspondence in our pages.

"St. Paul's Bridge" is the title of our second article (p. 92).

Notes (p. 92) include: "Stafford House, St. James's"; "Vistas"; "The Edward VII. Memorial"; "The Professions and Municipal Work"; "The Y.M.C.A. Building, Manchester"; "Educational Advance."

A few biographical notes on the new architect-knight, Sir R. S. Lorimer, are given on p. 93.

Our illustrated article on the work of Professor Reginald Blomfield, A.R.A., is given on p. 94, under the title "Contemporary Architects and Their Work."

"Three Exhibitions of Students' Work" is the title of an article on p. 97. The Exhibitions are: The Architectural Association; University College; and the London County Council Central School of Arts and Crafts.

A short account of the third summer visit of the Architectural Association, to Knole House, Sevenoaks, is given in this issue, p. 97.

The list of awards and prizes in connexion with the students' work of the Architectural Association is printed on p. 97.

The Royal Sanitary Institute Congress is being held this year in Belfast, and the proceedings were opened on Monday, upwards of 750 delegates and members attending (p. 98).

Correspondence (p. 100) includes: "Manchester Library and Art Gallery"; "King Edward VII. Memorial"; "Shrinkage of Joinery in Hot Weather"; "Hyde Park Corner"; "Gidea Park Exhibition."

The illustrated Monthly Engineering Review (p. 103) includes: "Vault Retaining Walls"; "Perfector Bar Beam Test"; and Notes.

The Building Trade Section (p. 108) includes: "Variations"; "Factory and Workshop; Cleaning and Painting"; "Leicester Employers and the Insurance Bill"; "Projected New Buildings in the Provinces"; "Applications under the 1894 Building Act," etc.

MEETINGS.

SATURDAY, JULY 29.
The Institution of Municipal Engineers.—Meeting at Edinburgh.

The Institution of Municipal and County Engineers.—Midland district and special meetings to be held at Hapsworth, near Birmingham.

Manchester Society of Architects.—Visit to Mollerley.

TUESDAY, AUGUST 1.
Manchester Society of Architects.—Visit to new bank premises, Piccadilly. Messrs. T. Worthington & Sons, architects. Windsor Bridge Timber Yard (Mr. J. H. Ashton), to see specimens and methods of cutting various kinds of timber.

THE LONDON COUNTY COUNCIL.

The usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. Edward White (Chairman) presiding.

LOANS.—A loan of 2,500*l.* is to be made to the Hampstead Borough Council for the purpose of obtaining a site for the extension of the Council offices.

The Stepney Borough Council is to receive a loan of 5,260*l.* for the erection of an electricity sub-station.

ST. PAUL'S BRIDGE.—The General Purposes Committee reported that since their last report, in which sanction had been given to the Chief Engineer of the Council to attend before the Committee dealing with the Bill for the construction of this bridge, they had also given permission for the Architect to the Council to attend in the same capacity.

Mr. J. D. Gilbert rose and complained that no report on this subject of the bridge had been made to the Council, and he

considered that the Council were being treated with contempt. He said that in the debate on this matter in the House of Commons Mr. Hayes Fisher had said that the Council was not prepared to increase its contribution of 350,000*l.* to the cost of the bridge if a more expensive scheme were adopted. They would, he had said, give that amount cheerfully, but were not prepared to double it. Mr. Gilbert said that these statements implied that a bargain had been made between the Council and the City Corporation, but, so far from having made a bargain, the Council had not even had a proper report on the matter.

In supporting Mr. Gilbert, Mr. A. J. Shepherd said that Mr. Fisher had no right to say that the Council would not give more than 350,000*l.* towards the cost of this scheme. He (Mr. Shepherd) knew that negotiations were at that very moment going on with the Corporation with reference to carrying tramlines over the new bridge, and unless the Council were presented with a report on the proceedings at the next meeting, he would feel that once again they were being hoodwinked.

Mr. Hayes Fisher, in replying, said that in his speech in the House of Commons he had been very careful to explain that he was not speaking with authority for the Council, though he believed he had the dominant party and most of the members on the other side behind him in all he said, and although the negotiations were not completed, there was an honourable bargain that the bridge should be made wide enough for the trams to come over, and that the Council would have the assistance of the Corporation when they wished to obtain power to construct tramways over the bridge. The Bill had still to run the gauntlet of the Committee of the House of Lords.

SCHOOLS.—It is proposed to erect a new school for 800 children in the neighbourhood of St. George's, Hanover-square, to replace the Horseferry-road school.

Additional store-room and an additional room for the superintendent is to be provided at the Anerley residential school, at an estimated cost of 374*l.*, and enlargements, providing additional accommodation for 384 children, are to be carried out at the Crompton-road school, Brixton, at a cost of about 200*l.*

Various improvements are to be carried out at the following schools during the summer holidays:—Cranbrook-road, Bethnal Green; Alton-street, Bow and Bromley; Haggerston-road, Haggerston; and Faunce street, Newington.

HORTON ASYLUM. In a report of the Asylums Committee it was stated that, as there was no provision for bathing at the nurses' infirmary at this asylum, it was desirable to erect a bathroom, and also to erect an additional entrance to the main wash-house from the east side.

Plans have been prepared by the Asylums Engineer and approved by the Lunacy Commissioners for the erection of a new asylum on the vacant site on the Horton Estate. The estimated cost of the building is 459,200*l.*

CINEMATOGRAPH THEATRE.—The Building Acts Committee stated that a cinematograph theatre is to be erected in Gaisford-street, Kentish Town.

FIRE-STATIONS.—Electric lighting is to be installed at the Shadwell and Stoke Newington fire-stations, and various alterations are to be carried out at the Kilburn, Bayswater, Euston, Eltham, Herne Hill, Northcote-road, Deptford, Lewisham, and Brompton fire-stations.

CAMBERWELL.—It is proposed to widen Red Post-hill between Sunray-avenue and North Dulwich Station. This improvement will have the effect of increasing the width of the road from 44 ft. to 50 ft. for a distance of about 1,150 ft.

ILLUSTRATIONS.

The Work of Professor Blomfield, A.R.A.

IN our plates this week we illustrate some of the work of Professor Reginald Blomfield, A.R.A., the illustrations being given in connexion with an article on another page on "Contemporary Architects and Their Work."

FIFTY YEARS AGO.

From the *Builder* of July 27, 1861.

Mr. Ferrey's "Recollections of Welby Pugin."

AUGUSTUS WELBY NORTHMORE PUGIN was born on March 1, 1812, in Store-street, Bedford-square, where his father then resided. He became a day boy at Christ's Hospital, Newgate-street, better known as the Blue Coat School, when the Rev. Dr. Trollope was head master of the school, and in all branches of education showed remarkable aptitude. After completing the ordinary course of education at Christ's Hospital he did not proceed to either of the Universities, but shortly afterwards entered his father's office. He had an almost intuitive talent for drawing, and as soon as he could handle a pencil commenced sketching.

Welby Pugin's first employment, independently of his father, seems to have been given to him by the celebrated goldsmiths, Messrs. Rundell & Bridge. One of their firm, while engaged in an examination of some ancient designs for plate in the Print Room of the British Museum, chanced to notice that Pugin was employed in copying the prints of Albert Durer and Israel Silvester. Struck by his skill in drawing, the goldsmith accosted him, and soon found that he possessed just the genius his firm was seeking. His complete knowledge of Mediaeval art fitted him admirably for designing plate in the old manner.

BOOK RECEIVED.

THE LONDON CITIZEN'S YEAR-BOOK, 1911-12. (London: Geo. Allen & Co., Ltd. 1s. net.)

UNIVERSITY COLLEGE SCHOOL OF ARCHITECTURE.

Mr. Leonard Stokes, the President of the Royal Institute of British Architects, performed the opening ceremony, on the 21st inst., at the Architectural Exhibition, which has been held in the Science Library at University College, Gower-street, during the present week. The Exhibition, a notice of which appears on another page, contains the drawings made during the present session by the day students at University College, who are taking a two or three years' certificate or degree course, and by students attending the evening course of design, the cost of which is defrayed by the Carpenters' Company. Mr. Stokes, in declaring the Exhibition open, congratulated Professor Simpson on the excellent standard of the work. It was proposed to institute a higher course of architectural training at the College. The establishment of such a course would meet a long-felt want. Many opportunities for learning were provided for the younger students, but they had not provided instruction in the higher branches, such as town planning, to the extent that they ought to do.—Dr. Gregory Foster, the Provost, in moving a vote of thanks to Mr. Stokes, said it was proposed to institute the new course, which would be one in advanced academic design, under the able guidance of Dr. Burnett next year. But they were in need of additional accommodation. A building originally intended for the bursar's house had been made to serve the purposes of the architectural students, but it was quite inadequate. The Senate of the University of London had come to the conclusion that the needs of London and the country generally in regard to architectural education would be better met by organising one strong school of architecture rather than by maintaining two relatively weak ones—one at University College and one at King's College. It was proposed, therefore, when the funds were forthcoming for a larger building, to transfer the Department of Architecture, which had hitherto been at King's College, to University College, and house it all in one building. That would mean that Professor Eley Smith and his staff at King's College would join Professor Simpson and his staff at University College. Mr. Percy Preston, Past Master of the Carpenters' Company, seconded the motion, which was adopted.

MONTHLY REVIEW of ENGINEERING.

PERFECTOR BAR BEAM TESTS.

FROM the standpoint of architects it is much to be regretted that so few scientific tests have been conducted in this country on reinforced concrete beams by other structural members.

Great many practical tests have been made on completed structures, but, while it is true that the works in question are capable of supporting considerably more than the calculated superimposed loading, such tests afford no precise data for the guidance of designers.

two months from the date of moulding, the crushing strength of the concrete was taken at 2,165 lb. per square inch.

Steel Tests.

Specimens of steel cut from bars in the beams after testing were examined by Messrs. Kirkaldy & Son, the results being as follows:—

Tensile Strength.	Elastic Limit.	Elongation
Lb. per square inch.	Lb. per square inch.	in 8 in. Per cent.
63,566	42,200	24.9

Description of Test Beams.

Beams of Type A.—These were T-beams of the following average dimensions:—Total

effective depth, 12.12 in. The reinforcement consisted of two 1-in. diameter Perfector bars threaded with 1-in. by $\frac{1}{4}$ -in. stirrups, spaced 8 in. apart on each bar, and arranged so that one stirrup occurred every 4 in. from each end to near the middle of the beam. The compression flange was reinforced with $\frac{3}{8}$ -in. diameter rods, alternately straight and curved, spaced 5 in. apart centre to centre.

Beams of Type B.—These were rectangular beams of the following dimensions:—Total length, 11 ft.; clear span, 10 ft.; width, 7.24 in.; total depth, 14.09 in.; effective depth, 11.79 in. The tension reinforcement consisted of two $\frac{7}{8}$ -in. diameter Perfector bars, threaded with $\frac{3}{8}$ -in. by $\frac{1}{4}$ -in. stirrups, spaced 4 in. apart for the length of about 3 ft. 4 in. from each end, and two pairs of stirrups, spaced 8 in. apart on either side of the middle of the beam. The compression reinforcement consisted of one $\frac{7}{8}$ -in. diameter Perfector bar threaded with stirrups of the same dimensions as those provided for the tension bars, and similarly spaced.

Beams of Type C.—These were rectangular beams of the following dimensions:—Total length, 11 ft.; clear span, 10 ft.; width, 7.15 in.; total depth, 14.09 in.; effective depth, 12.24 in. The reinforcement consisted of two $\frac{3}{4}$ -in. diameter Perfector bars threaded with $\frac{3}{8}$ -in. by $\frac{1}{4}$ -in. stirrups, spaced 8 in. apart, and arranged so that one stirrup occurred every 4 in. from each end to near the middle of the beam.

NOTE.—The beams were in no way laboratory specimens, but were made as ordinary commercial beams. In order to conduce to this end, the materials and moulds were obtained from a reinforced concrete building in course of erection in the neighbourhood of Messrs. Kirkaldy & Son's laboratory.

Results of Tests.

The main object of the experiments, as stated in the report by Messrs. David Kirkaldy & Sons, was "to ascertain the resistance to deflection under a gradually increased bending stress," due to loading applied at two positions spaced each at one-third of the span, the deflections being measured at the middle.

Fig. 1. The Perfector Beam (after destruction).

Therefore we have special pleasure in drawing attention to a recent series of experiments conducted by Messrs. David Kirkaldy & Son on a set of nine reinforced concrete beams made at their works in accordance with the designs of Perfector Buildings & Constructions, Ltd., of Westminster. A distinguishing feature of the beams was the employment of the Perfector Trussed main and web reinforcement. In this main bar has attached web members, the latter passing through slots cut in a projecting from it. The vertical stirrups can be spaced at distances of from 2 in. to 20 in., according to requirements, and can be of any length, depending to the depth of the beam. It is noted for this arrangement that an absolute test is provided against the slightest movement of the steel in the concrete, independent of the adhesion between the two materials.

Concrete Cube Tests.

In order to determine the crushing strength of the concrete used for the beams, 6-in. cubes were prepared by Messrs. Kirkaldy & Son of the concrete mixed by Perfector Buildings & Constructions, Ltd. The proportions of the concrete were 1 part Portland cement (80 lb. per cubic foot), 3 parts sand, and 4 parts ballast, $\frac{3}{4}$ -in. size. Four gallons of water were added to every 7 cubic ft. of this mixture. Three cubes were tested at one month, three at two months, and three at three months, the average results being 1,623 lb., 1,811 lb., and 2,469 lb. per square inch, respectively.

The beams were tested at the age of

length, 11 ft.; clear span, 10 ft. 6 in.; width of compression flange, 35.8 in.; width of web, 7.2 in.; thickness of compression flange, 4.08 in.; total depth, 14.25 in.;

DEFLECTION OF T BEAMS. TYPE A.

Fig. 2.

The following data are condensed from the report by Messrs. David Kirkaldy & Son:—

Average Deflection of Beams.			
Superload.	Type A.	Type B.	Type C.
Lb.	In.	In.	In.
2,000	0.065	0.064	0.065
4,000	0.13	0.119	0.121
6,000	0.23	0.242	0.246
8,000	0.38	0.371	0.378
10,000	0.54	0.510	0.515
12,000	0.70	0.638	0.643
14,000	0.88	0.757	0.778
16,000	1.07	0.875	0.895
18,000	1.26	0.991	1.015
20,000	1.46	1.107	1.135
22,000	1.72	1.223	1.255
24,000	1.97	1.339	1.375
26,000	2.23	1.455	1.495
28,000	2.48	1.571	1.615
30,000	2.75	1.687	1.735
32,000	3.07	1.803	1.855
34,000	3.40	1.919	1.975
36,000	3.87	2.035	2.095

The ultimate superload for the three beams of type A ranged from 37,800 lb. to 42,480 lb., the average being 40,273 lb. The first beam of this type failed partly by tension and partly by shear, and after the ultimate load had been reached it broke down completely by shearing at one end. The second beam gave somewhat better values than the first one tested; at the load of 24,000 lb. a very fine shear crack opened at each end, and at 28,000 lb. two more well-defined shear cracks developed, and the steel rods began to draw in. Finally, tension cracks at the middle of the beam extended beyond the neutral axis, and the beam failed completely, the concrete also failing in compression. Fig. 1 is from a photograph of this beam after destruction. Notwithstanding the shear cracks, the beam ultimately failed by flexure. The third beam of this type showed a still better result as to ultimate strength. At the load of 20,000 lb. two slight hair cracks appeared, at 30,000 lb. seven tension and four shear cracks opened, and at 36,000 lb. there was a shear crack at one haunch and the steel rods were seen to be drawing in.

The ultimate superload for the three beams of type B ranged from 26,010 lb. to 27,100 lb., the average being 26,718 lb. There was no sign of shear in any of these beams nor of slipping of the reinforcement. The first hair cracks appeared at the total load of 16,000 lb.

The ultimate superload for the three beams of type C ranged from 22,880 lb. to 24,160 lb., the average being 23,427 lb. The behaviour of these beams was very similar to that of type B series, except that in one case slight shear cracks opened at each end.

DEFLECTION OF BEAMS TYPE C

Fig. 4.

DEFLECTION OF BEAMS TYPE B.

Fig. 3.

The following values, calculated by Perfector Buildings and Constructions, Ltd., will probably be interesting to our readers:—

Beam Type.	Stress in Steel at Ultimate Load.	Stress in Concrete at Ultimate Load.	Factor of Safety on Total Load.
A	31,708	1,229	3.24
B	44,467	2,320	4.30
C	50,392	2,378	4.40

Figs. 2 to 4 are diagrams illustrating the deflection of the three types of beam. It should be noted that after the stress at P has been passed the deflection increases very rapidly, and failure occurs with a comparatively small addition of loading. This illustrates the fact that the effective resistance of reinforced concrete construction, in the form of members acting as beams, depends upon the elastic limit of the steel so far as tension is concerned, and not upon the ultimate tensile strength of the metal as denoted by laboratory tests of small specimens.

The tests described in the present article were witnessed by various well-known engineers and architects, including Colonel Winn, R.E., Mr. A. Ross, M.Inst.C.E. (G.N.R.), Mr. E. R. Waight, M.Inst.C.E. (S.E. & C.R.), Mr. W. A. Cashman, M.Inst.C.E. (G.W.R.), Mr. A. W. Hall, A.R.I.B.A., and others.

THE DESIGN OF VAULT RETAINING WALLS IN REINFORCED CONCRETE.—II.

By A. HEDLEY QUICK, Assoc.M.Inst.C.E.

In the previous article (March 24, page 370) the design of the vertical portion of a wall of the type indicated in Fig. 1 was worked out in detail, and the next step is to find the width of the base necessary to satisfy the condition already mentioned, viz., a factor of safety of 2 against overturning.

For this purpose we shall decide upon "heel" projecting behind the wall 3 ft. The forces acting are as shown in Fig. 7, the shaded area representing the earth pressure diagram P' similar to that in Fig. 6, but in this case taken down to the underside of the base for which we must provisionally assume thickness, say, 15 ins.

E = the weight of the earth over the "heel" in pounds.
W = the weight of the wall neglecting the toe at the bottom in pounds.
B = the weight of the wall base in pounds.

The total earth pressure, $P' = 20(14)^2 \div 2 = 3,881$ lbs., see eq. 4, and acts at a distance up from the bottom of the wall base,
 $= 60 \times 11\frac{1}{2} + 61 \times 11\frac{1}{2} \div 2 = 4.40$ ft. see eq. 3.

Weight of the earth over the "heel" lbs. lbs.
..... $= 12 \times 2\frac{1}{2} \times 1 \times 120 = 3,600$
Weight of the wall, $= 10 \times 9\frac{1}{2} \times 1 = 118$
Weight of the wall base = $L \times 1\frac{1}{2} \times 1 = 150 = 157\frac{1}{2}$

Each of these forces acts at its centre of gravity found graphically as previously explained and as indicated by dotted lines in Fig. 7.

Taking moments about "A" and allowing for the factor of safety of 2, we get:
 $2(60 \times 11\frac{1}{2} + 61 \times 11\frac{1}{2}) = 3,420(L - 1\frac{1}{2}) + 118L \div 2$

$3,472 = 3,420L - 4,275 + 118L - 3108 + 59,75L$
 $83,75L + 4608L = 41615$
 $L^2 + 49.15L = 443.80$
 $L^2 + 49.15L + 24.375 = 443.89 + 24.375$

by taking the square root of both sides,
 $L + 24.375 = \pm 32.37$,
from which we get, neglecting the negative value,
 $L = 7.80$, or, say, 8 ft.

To find where the resultant "R" of the vertical forces and the earth pressure cut the base, and consequently the upward earth pressure diagram, and so enable us to design the base is our next step. We must take the moments about "A," say (Fig. 8), of all the vertical loads, and divide by the sum of these loads to get the distance "x" of their resultant from "A."

$x = \frac{3,420 \times 1\frac{1}{2} + 1188 \times 2\frac{1}{2} + 8 \times 1\frac{1}{2} \times 150 \times 4}{6108} = 2.20$ ft.

and the distance "y" from this line at which the resultant of all the forces will cut the base can either be obtained graphically by the parallelogram of forces, as indicated in Fig. 5, or by simple proportion, thus:

$\frac{6108}{3881} = \frac{4.40}{y}$
or $y = \frac{3881 \times 4.40}{6108} = 2.80$

and $2.80 + 2.20 = 5.00$ ft. from A, or $5.00 - 4.00 = 1.00$ ft. from the centre of the base.

We now have in Fig. 9 the base of the wall with the inclined resultant "R" of all the forces acting at "A." This inclined force Q may be replaced by a vertical force Q' = to the sum of all the vertical forces and a horizontal force S = to the total earth pressure.

The vertical force Q, acting at a point "m" feet from the centre of the base, may, by well-known theorem in mechanics, be shifted to any other point by introducing a couple = $Q \times d$ a lever arm equal to the distance through which the force has been moved.

This will not alter the total effect of the force but shifting the vertical force Q to the centre will now cause direct and uniform pressure over the entire base and the couple $Q \times m$ will tend to cause tension over the left and compression over the right half of the base, the total upward earth reaction being the sum of these forces and will equal

$\frac{Q}{A} \pm \frac{Q \times m}{I} \times y$ eq. 1

where
y = distance in feet of the edge of the base from the centre of the same.

A = area of the base in square feet taking 1 ft. width.

I = the Moment of Inertia in foot units of the base about its centre of gravity.

In our case we have

$\frac{6108}{8} \pm \frac{1537}{512} \times 1 \times 4 \times 12$

lbs. lbs.

$= 764 \pm 573$ per square foot.

$= 1337$ lbs. per square foot maximum compression at edge "D."

and 191 lbs. per square foot maximum compression at edge "A."

as shown shaded in Fig. 10.

By the same graphical construction previously explained, we can find as indicated

centres of gravity of those portions of the wall and earth reaction, causing bending on the cantilever AB and CD. The B.M. at C is that due to the upward earth reaction acting CD \times the distance of its centre of gravity from C—the weight of the portion of the base \times the distance of its centre of gravity from

ft. lbs.
B.M. at C = $\frac{632 + 1337}{2} \times 4\frac{1}{2} \times 2.75 = 13311$
lbs.
 $- 4\frac{1}{2} \times 14 \times 1 \times 150 \times 2\frac{1}{2} = 2266$
11045

causes tension on the lower and compression on the upper side, and from eq. 7 find $d = \sqrt{\frac{11045}{95}} = 11$ ins. bare, and steel required per foot = $12 \times 11 \times$

The B.M. at "B" on the cantilever AB is that due to the downward weight of the earth over the "heel" \times the distance of its centre of gravity from B + the weight of the "heel" \times AB \times the distance of its centre of gravity from B—the upward earth reaction acting over the same portion \times the distance of its centre of gravity from "B."

ft. lbs.
or B.M. at B = $2 \times 12 \times 120 \times 1 = 2880$
 $+ 2 \times 14 \times 150 \times 1 = 375$
3255
 $- \frac{191 + 478}{2} \times 2 \times .85 = 569$
2686

This causes tension on the upper and compression on the lower side, and as the depth "d" \times "d" must for practical reasons be equal to the front portion CD or 11 ins., we shall find

Fig. 7

775 = 891 sq. ins., or say $\frac{1}{2}$ -in. rods at 4 in. centres and the depth over all = 13 ins., say, we could not lay much less than 2 ins. of concrete before placing the rods in position, in many sites it might be necessary to first

Fig. 9.

a bed of concrete 4 ins. to 6 ins. in thickness. About 2 ft. from the end "D" probably an alternate rod might be stopped; this would, however, be verified by a similar calculation to the above, the B.M. being found at the point in question.

the percentage of steel required for this depth will equal

eq. 9 = $\frac{M \times .000071}{d^2} = \frac{2686 \times .000071}{121} = .00158$

and the area of steel required per foot = $12 \times 11 \times .00158 = .209$ sq. ins., or, say, $\frac{1}{2}$ -in. rods at 6 in. centres.

We must now try the bottom of the vertical wall for horizontal shear, the total shear at this point will be equal to the total earth pressure down to this point, and equals 3,200 lbs.; the shear stress here will

$\frac{3200}{12 \times 13} = 20.5$ lbs. per square inch,

which is quite safe.

We will now try the base for vertical shear at the point C; the total shear at this point will be equal to the upward earth reaction less the weight of the portion CD of the base; this equals $4840 - 799 = 4041$ lbs., the shear stress here will

$\frac{4041}{12 \times 13} = 26$ lbs. per square inch,

which is also quite safe.

The total force tending to cause the wall to

slide forward on its base is the total earth pressure down to the underside of the base, which equals 3,881 lbs. The total weight of the wall and the earth filling over the "heel" = 6,108 lbs., and as the co-efficient of friction between concrete and most clayey or sandy soils may be taken as about .33, the wall by reason

Fig. 10.

Fig. 8

of its dead weight alone would just be on the point of sliding with a thrust of only about

$\frac{6108}{3} = 2036$ lbs.,

and this allows for no factor of safety. Now, as the actual thrust to be resisted is about 3,881 lbs., it will be advisable to provide a toe as shown, although in probably all cases a raft will be constructed over the site against which the wall base will abut.

When the roof is added the weight thus brought on to the wall will slightly increase the compressive stress on the concrete, but it is so small in amount that it may be neglected.

The wall as finally designed will be as indicated in Fig. 11.

ENGINEERING NOTES.

For the reconstruction of Baker-street Station at Upper Baker-street and Improvements, Marylebone-road it has been found necessary to divert the two sewers beneath Park-road for a length of nearly 460 ft. The old sewer of 6 ft. 6 in. by 4 ft. 4 in. is replaced with one 454 ft. long

Vault Retaining Wall. Fig. 11.

behind the new railway wall, and has above it a fresh pipe to replace the former 21-in. water main. The 3 ft. 9 in. by 2 ft. 6 in. sewer on the other side of the new lines has been diverted for a distance of 270 ft., and another one is built in its stead. The two concrete walls of the widened tunnel, about 550 ft. long, are from 6 ft. to 10 ft. thick, with foundations from 8 ft. to 18 ft. thick. The superimposed girders will, it is anticipated, be utilised to carry suites of residential flats as well as the tunnel and roadway roofing, and those over the east station will be similarly adapted to sustain the new headquarters of the railway staff. Part of the space hitherto occupied by the booking-office at the corner of York-place will be thrown into the proposed widening at the crossing with Marylebone-road. Mr. W. Willox, engineer to the Metropolitan Railway Company, made the plans for the works now in progress.

Central Heating Stations for Cities.

In the United States and Canada there are already about 600 central stations for the distribution of steam and hot water to the residents of some 300 towns, ranging in population from more than 10,000 inhabitants to less than 5,000 inhabitants, the first establishment of the kind dating from the year 1876.

A recent memoir, contributed by M. A. Beaurienne to the Société des Ingénieurs Civils de France, sets forth the methods followed and results obtained in systems of the kind, and discusses the point whether there exist any technical reasons or other considerations to explain why this branch of industry is practically unknown in Europe, while it has so largely developed on the other side of the Atlantic. After expounding the principles adopted in the

distribution of heat in cities and describing typical installations so applied, the author points out the advantages of central heating services over private installations, and having formulated a general theory of the public distribution of heat, particularly in the form of steam, he applies the results of his theory to a quarter of Paris and to the district served by the installation at Lockport, U.S.A.

The author comes to the conclusion that there are good reasons for following the example set in America, not in the direction of simple imitation, but by the evolution and application of a more scientific theory, taking due account of past experience in the perfection of a system which possesses various claims to attention.

Effect of Water Percentage on Porosity of Concrete.

ONE factor of importance in the production of concrete capable of withstanding penetration by water is the proportion of water mixed with the dry constituents. It is now generally recognised that other things being equal a wet mixture results in concrete of greater impermeability than a dry mixture,

Effect of Water on Porosity of Concrete.

unless the latter is very closely compacted by ramming or heavy pressure. Some tests by Messrs. Westinghouse, Church, Kerr, & Co. give definite results which appear to indicate the most suitable percentages of water for use in mixing concrete intended to be impermeable. The curve reproduced on this page shows the percentage of water absorbed by concrete blocks during twenty-four hours' immersion in water. From this diagram it will be seen that the effect of too much water is as undesirable as that of too little, the happy medium being about 14 or 15 per cent. Although an isolated series of tests can never be regarded as conclusive, the results obtained by the firm mentioned are of distinct interest, and there is no reason for doubting their substantial accuracy.

Reinforced Concrete Coping for a Sea-Wall.

THE accompanying illustration shows a simple adaptation of reinforced concrete for the improvement of a sea-wall at the United States naval station of Key West. As originally built, the wall had a plane face with a batter of 1 in 4, its top being little more than 4 ft. above high-water level. In rough weather considerable damage was usually done by water rising over the wall and washing away the earth behind. In order to throw back the

Reinforced Concrete Coping for a Sea-Wall.

(From "Engineering News.")

waves a concave coping was added to the front of the wall, as shown, the concrete being keyed into the old work and held by 1/2-in. diameter diagonal bars spaced 18 in. apart, in addition to two longitudinal 1/2-in. diameter bars. The work cost about 2s. 1d. per lineal foot, and was executed under the direction of Mr. De Witt Webb, civil engineer, United States Navy.

The German Tests of Reinforced Concrete Columns.

REFERRING to our Note of June 9 last (p. 722), Messrs. Wayss & Freytag, the firm to whom was entrusted the construction of the test columns having spiral transverse reinforcement, point out that varying atmospheric conditions and care in manufacture were more important factors in the first series of test results than the different forms of transverse reinforcement, and they also emphasise the point that in all cases fracture occurred at those ends of the vertically moulded columns which were last rammed without regard to the position of such ends in the testing machine. Owing to the inconclusive nature of the first tests a further series was undertaken, as stated in our Note. With regard to the second series, Messrs. Wayss & Freytag say that these columns with spiral reinforcement showed the highest breaking loads, but that as in this series fracture again occurred at that end which was last rammed, and as manufacture by contractors' workmen cannot be considered as sufficiently careful or regular, it follows that precise conclusions as to the behaviour of the various methods of transverse reinforcement cannot be drawn from these tests.

Both series of tests are to be regarded as preliminary, and a further set will be conducted on columns having strengthened heads, so that

influence of the transverse reinforcement will be clearly demonstrated. In a future issue we hope to give further and final reports on the tests.

Driving Piles In cases where soft strata are overlaid by a thin crust of hard material, piles can be readily driven without injury to the stratum of hard material by first breaking a hole through the latter. This expedient was successfully adopted on the Lehigh Valley Railway in a place where piles 55 ft. long had to be driven. The hard material was penetrated by means of a strong steel pipe provided with a steel point, and the piles, being driven into holes so made, were driven without difficulty into the softer material below. As timber piles are often shattered by driving the method is one deserving attention.

The Middleborough Bridge. DESTINED to take the place of the present steam ferries between the town of Middleborough and Port Clarence, on the opposite side of the River Es, the bridge now being constructed by Sir William Arrol & Co., Ltd., under the superintendence of Mr. S. E. Burgess, M.Inst.C.E., the rough Engineer, is one of the largest transfer bridges hitherto projected, having a span of 570 ft. long at the height of 160 ft. above high water. The span is carried by steel towers 250 ft. high above low-water level, supported by caisson foundations, one of which extends 90 ft. below the river bed. The spans are provided on the under side of the bridge with the operation of a carriage propelled by electricity, and from which will be suspended a travelling-car at the same level as the roadways on either side. The car will be capable of transporting trams and other vehicles, as well as 600 foot passengers. Though this and one or two kindred structures have been built in Great Britain by British engineers, it should not be forgotten that the development of the system on modern lines is entirely due to a French engineer, François Michelin, of Chateaufort-sur-Loire.

Permanent Expansion of Cast-Iron by Repeated Heatings. THE "Growth of Cast-Irons under Repeated Heatings" is the title of an instructive paper contributed by Professor Carpenter, of Victoria University, to the Iron and Steel Institute. As shown by more than one building, the subject is of direct interest to architects, who are naturally concerned in finding a variety of iron not liable to the risk of serious permanent expansion in case of fire. The first part of the paper discusses the influence of phosphorus, sulphur, and manganese, and other substances, and contains calculations of the approximate growth that may be expected in cast-irons whose chemical composition is known. The second part is of a scientific interest, and the third part is an account of experiments undertaken with the object of finding a commercial cast-iron of negligible growth after repeated heatings. On the practical standpoint this is the most important part of the paper. Briefly stated, the following are the main conclusions to be drawn:—Phosphorus, sulphur, and manganese tend to diminish growth; silicon tends to increase growth to the extent of 15 per cent. for 1 per cent. of that element, 27 per cent. for 3 per cent., 34 per cent. for 3 per cent., and similarly diminishing proportions for other percentages of silicon. By adopting suitable proportions of the regular constituents cast-iron can be produced showing no signs of growth in 150 heats.

Municipal Building, New York. ONE difficulty connected with the construction of huge steel frame buildings arises out of the necessity for transporting large structural members through the crowded streets. In the case of the new Municipal Building, New York, many members of exceptional dimensions have to be transported, among them being twelve girders, 47 ft. 6 in. long by 10 ft. deep, and

weighing about 50 tons each. Every one of these girders has had to be conveyed from the Battery to the building site at the approach to Brooklyn Bridge on a special lorry drawn by some thirty-five horses, a team that could not be manipulated very well through tortuous streets. As the New York police regulations do not permit the streets to be used at ordinary times by teams of more than about a dozen horses, the transport of these heavy girders was performed on two Sundays. The members in question are destined to be erected at fourth-story level above the arch permitting Chalmers-street to be carried through the middle of the great building.

New York Rapid Transit Subway Extension. LAST month a joint Committee of the Public Service Commission and the Board of Estimate recommended extensions of the Rapid Transit Subway at the total estimated cost of more than 51,000,000. It is proposed that contracts should be made with the Brooklyn Rapid Transit Company and the Interborough Company, the former being awarded all the lines crossing the East River bridges; the Fourth-avenue subway, Brooklyn; lines from Liberty-street, along Broadway and Seventh-avenue to Fifty-Ninth-street, and over the Queensborough Bridge, and a line from Union-square, under the East River to the eastern part of Brooklyn. The Interborough Company are offered a line from Forty-Second-street to the Battery; another along Lexington-avenue, with extensions in the Bronx and various extensions in Brooklyn and Queens. The Committee recommend that the share of the municipality should be about 26,000,000, the remainder to be shared proportionately by the two railway companies. The heavy expenditure involved in this project shows the exceptional need of New York for increased traffic facilities, and the readiness of the city authorities to deal with the question in a public-spirited manner.

Steel Water Tower Cased in Concrete. AS AN alternative to the payment of 100l. per annum for insuring their own property and adjacent buildings, the owners of a steel water tower in New Jersey decided to encase the tower in concrete and to rely upon the protection so afforded. The tower contains 100,000 gallons of water, the total height being 174 ft. above the ground, and the cost of sheathing with concrete amounted to 800l. The interest on this sum at 6 per cent. is 48l. per annum, a charge giving reasonable assurance of absolute protection at less than half the premium for covering damages for which the owners might be liable in case the tower collapsed as the result of fire. Moreover, the saving on the insurance premium will pay for the concrete work in about fifteen years, and thus extinguish any further charge. The use of concrete here denoted is one that may often be adopted with advantage and economy.

Standardised Drawings for Reinforced Concrete. In the Report of the Concrete Institute dealing with the standardisation of drawings for reinforced concrete work it is suggested that, as the material in question is most extensively used for buildings, drawings should conform closely to general architectural practice. This is a recommendation with which we are in entire agreement.

With regard to scales, the following are proposed:—

- General Drawings.*
 $\frac{1}{8}$ in. Schemes in outline (large structures).
 $\frac{1}{4}$ in. Schemes in outline (average practice).
Detail Drawings.
 $\frac{1}{8}$ in. Framing plans and slab reinforcement.
 $\frac{1}{4}$ in. Elevation of beams and general details (large members).
 $\frac{1}{8}$ in. Elevation of beams and general details (average practice).
 $\frac{1}{4}$ in. Sections of beams, etc.
 $\frac{3}{4}$ in. Large details of intricate work.
For ordinary work three scales— $\frac{1}{8}$ in., $\frac{1}{4}$ in., and $\frac{3}{4}$ in.—are considered sufficiently elastic. All dimensions should be figured, and for general purposes it is proposed that drawings

should measure 40 in. by 27 in., or 20 in. by 27 in. within the border line.

The indication of reinforcing bars in general can be effected by thick solid lines for main bars, and medium solid lines for secondary bars, the following conventional signs being recommended for detail drawings.

Reinforced Concrete Symbols.

The Report also contains a list of proposed abbreviations for denoting various forms of bars, sheet meshes, and other particulars. Suggestions for lettering and colouring drawings are also given.

The general adoption of the recommendations contained in this Report, possibly with some modifications, should do much to save unnecessary work on the part of specialist firms and contractors, and would be a boon to architects and municipal engineers who may have to deal with drawings submitted by competitors for the explanation of tenders.

Corrosion of Harbour Board of Wellington, New Zealand. A REPORT by the engineer to the extensive corrosion has taken place in the Muntz metal sheathing and bolts applied to nearly all the timber wharves of the port. The metal used within the last ten or twelve years appears to be less satisfactory than that applied several years before. For instance, in the case of a wharf completed in 1908, the sheathing and bolts are deteriorating very rapidly. When examined at a recent date some bolts were so much corroded at the screwed end that the nuts were quite loose. Efforts are being made to find an alloy of moderate price capable of withstanding corrosion. The most effective remedy would be to replace existing wharves gradually by reinforced concrete structures, a policy which has been adopted in many British, American, and other ports.

Coast Erosion. The third and final report of the Royal Commission on Coast Erosion dispels any hope that the protection of our coast line will be undertaken by the State. The Commissioners find that, while serious loss is occurring in many places, and particularly on the east coasts of England and Ireland, the erosion does not affect the nation at large, and does not call for any intervention by the State beyond that resulting from extended administrative assistance. There is no evidence of any changes in the relative levels of sea and land. Hence the problem for solution is simply the provision of means for protecting coast lines threatened against the effects of tide, wind, and frost. The technical evidence presented in Part III. of the report will prove invaluable to engineers in the design of protective works. A proposal of useful character is that all foreshores remaining the property of the Crown shall be administered by the Board of Trade, and that additional powers shall be conferred on the same board enabling them to control the removal of beach material and the construction of protection works, to supervise and assist existing authorities concerned in coast protection, and to create new authorities where necessary. If the recommendations of the Commission are adopted, the Board of Trade will have the assistance of engineering experts, and will make arrangements for watching the coasts and preventing any acts or works contrary to the public interest.

THE BUILDING TRADE.

VARIATIONS.

THE term "variations" has a different significance according to the point of view from which they are looked at. From the one point "additions" are the characteristic features, and from the other, "omissions." The foreman generally does not beat about the bush, but designates them boldly "extras"; but in this article we shall deal with the term literally, as there are few contracts where items to which both terms apply do not occur.

If all contracts were carried out strictly to the letter, as far as procedure is concerned, and given a good bill of quantities consistently priced, this should not be a troublesome matter, but this premises a good set of drawings and full details prepared at the outset, a full specification, every order for a variation given in writing—how often is this precaution omitted and with what unfortunate results—day-sheets, verified by the clerk of works, and sent in week by week, and a careful record of all work covered up, agreed to as correct by the contractor or his foreman and the architect or the clerk of works, or else measured by the surveyor during the progress of the work. Such would be the ideal condition of things; but we are afraid it is not the lot of many surveyors to find such an ideal condition when proceeding on to the works to take up the measurement of variations.

Looked at from the surveyor's point of view, it is presumed that he prepared the original bill of quantities, so that there will be nothing to find fault with on this head. We must—if only as a matter of courtesy—reckon that the drawings and specification are all that can be desired, so that eliminates another element of trouble. We then come to the question of pricing—the question of ascertaining what are variations and the measurement of same we will leave till later. What a fruitful source of difficulty the inconsistency of pricing that occurs in the so many bills of quantities occasions. The "slips" of pricing "feet" for "yards," "yards" for "squares," and *vice versa*, one is continually running across, and there are great possibilities in this direction. Then those misreadings—to name a few of which have come under our notice. "Half brick walls in cement," at $\frac{1}{2}$ d. per foot on the supposition that the item is an extra over the bulk brickwork for building 4½-in. walls, although nothing was said to this effect. Another striking instance was an item of stone facing which was priced as "extra over brickwork," although the note "labour and materials" was put at the end and also underlined. This worked out on the variations as an extra cost. The builder, however, content with his good fortune in having saved some of his loss, did not press for the extra, although under the contract we do not think there is any doubt that he could have done. Still another. A client decided to have corrugated iron roofs to some large sheds in lieu of slating and boarding, and, being in fear of prices being "faked" as he termed it, refused to have the matter gone into before deciding (the priced quantities being sealed). He found at the end that he paid more for the corrugated iron than he would have done for the slating and boarding owing to the high price of the former and the low prices for the latter in the contract. These examples could be multiplied indefinitely, but those we have given are sufficient for our purpose. The question arises as to how far it is permissible to deal with the prices after the tender is accepted, but before the contract is signed. It is obviously unfair to other competitors to allow the contractor

whose tender is accepted to make any addition to his price. On the other hand a contractor may reasonably object to reduce his price. The fairest method, therefore, is to examine the prices beforehand, rectify obvious errors, and, if they make any appreciable difference to the total, to treat this difference as a percentage on the prices (as an addition or omission, as the case may be) in the final settlement of the accounts. This method eliminates one element—that of inconsistent pricing—that is often a cause of trouble. Where this procedure has not been followed our experience has been that in a friendly settlement of accounts neither side holds to the strict letter of the contract, but brings into play a wise discretion. On the one hand the client does not insist upon the contractor executing extra work at what may be a ruinous price, and on the other the contractor does not ask to be paid an obviously excessive price for extra work, notwithstanding the fact that he could claim such under the contract. Of course, this could not apply generally, but only in such cases as we have given examples of. It may be considered that this is establishing a dangerous precedent, but we have found in practice that, so far from causing complication, the result is quite the reverse, and it is obvious that this course is only possible where there is mutual confidence such as ought to obtain—and we are happy to believe does obtain with any extended business relationship. In those cases where either party approaches the business with the object of scoring off the other, the only course open is to stand strictly by the letter of the contract and each fight his own battle. It then becomes a case of "diamond cut diamond."

We have dealt somewhat fully with the question of inconsistent pricing, perhaps more fully than some may consider the importance of the question warrants, but we think that most contractors and surveyors have frequently been faced with the difficulty of arriving at a fair result when these discrepancies occur. We have, therefore, given the results of our experience extending over many years and under varying conditions, and we venture to hope with satisfactory results to all parties, to be considered for what they are worth.

The question of ascertaining what are variations now claims our notice. If the architect is careful to have every variation ordered in writing, the procedure is simple, and contractors would be well advised to ask for this, or, at any rate, to confirm in writing such orders if given verbally. Much trouble will be saved by this precaution, as such confirmation, in the absence of any protest from the architect, must necessarily be strong evidence for the surveyor to act upon. Some architects hand their surveyors all the correspondence relating to the work to be examined and notes made, so far as the letters relate to the question of variations, and we have found this works well. Where the architect keeps an order book for variations, the orders, of course, are unmistakable evidence, and unless he receives special instructions from the architect no surveyor would deal with any claim for a variation raised by a contractor, unless he could produce such an order. We would therefore strongly urge both parties to a contract to see that every order, whether for extras or omissions, should be in writing in some form or the other.

We think it is generally agreed that the bills of quantities should form part of the contract in fairness to all parties. In practice we generally find this is accepted (although there are notable exceptions in the case of some public bodies), whether it is so

stated or not. A good deal of discretion should, however, be exercised by both parties as to how far this should be carried, and it is, of course, obvious that it may cut both ways. The contractor who adopts a policy of "grab" by raising every little question may find himself met with items which far outweigh any claim he may make under this head. On the other hand the surveyor who either from incapacity or carelessness leaves many openings for such claims deserves all the trouble that falls upon his head, and the architect who finds himself involved in difficulties (because, after all, the architect is often the one to suffer) would do well to select another surveyor.

When measuring variations it is most essential that the system adopted should be identical with that of the original dimensions. The pricing will then be found quite a simple matter. It is a good system to keep each item separate regardless of the form of the final account, as it is easy to afterwards group items together in the final summary of accounts.

The pricing, to those who are conversant with the subject, should not be the debatable matter that it often is, but "trying it on" on either side is reprehensible—waiting to see what the other side will say instead of naming a fair price and sticking to it. In the case of a well-priced bill of quantities there should be very few debatable points on this head, as it ought to be easy to make up new prices from those of the contract. We say *should be*, but we are afraid that there are more bones of contention over the question of pricing, owing to inconsistency and want of method, than over any other portion of the work.

The question of day works has been, and probably always will be, a vexed one. These should be kept carefully and signed for by the clerk of works as correct, but it should be distinctly understood that in no case should the signature of the clerk of works be construed into either an order or even an undertaking that the item should be treated as day work, but simply as a record of the correct time and materials, leaving it to the discretion of the surveyor as to whether the item should be measured or accepted as day work.

Theoretically in many cases there should be no discrepancy between the price for work on a day-work basis and that on a measured basis, but we are afraid this state of things is the exception rather than the rule. It has always been our experience that where this theory has been accepted by the contractor, there have been fewer grumblings at losses than where there has been the attempt to get day work adopted at all costs, and we are speaking of contractors', not individual works. Where the contractors have accepted this theory we have found a perfect system of business in every department—good bookkeeping, good supervision, good feeling, consistent pricing even in competitive works, and evident prosperity. We emphasise these points so as to remove the possibility of a charge of slackness or generosity on the part of such contractors.

Although in most cities there is a general schedule of day-work prices arranged between the local institute of architects and the institute of builders, we do not think these should obtain in those cases where the price for materials without labour in the day-work schedule are inconsistent with the prices for labour and materials in the bills of quantities; although some contractors contend that these schedules override the bills of quantities. It is, however, surprisingly rare to find it absolutely impossible to measure work if the surveyor is really competent. That, at least, has been our experience.

have dealt with the subject, taking as is an ordinary competition on bills of prices, that being the more common mode in works of any size. In those cases where the contractor is paid a percentage on his cost there can be no question, should be clear as to whether the cost include establishment charges or not, as on this point often leads to trouble. We have emphasised the question of pricing as so often on this question that the element turns. If trouble arises from businesslike action on the part of either architect or contractor, or the before-mentioned policy of "grab," then we are not there is no system to satisfactorily the case, but we would again impress on contractors the necessity of careful and good bookkeeping and supervision. The latter would stop many wastages and packages that so often occur, and which sometimes turn a profit into a loss, while the enables the contractor to obtain all he is entitled to, and such being the case the should show a profit.

Much has lately been said upon the part of specialists, and the supply of articles, that we do not propose to with this question beyond suggesting a look-out as to the charges for carriage packages, and also the credit of returned packages, which is often a much larger than at first appears.

FACTORY AND WORKSHOP: SPECIAL EXCEPTION—LIME-WASHING, Etc.

The following order of the Secretary of State, dated July 1, 1911, has been issued:—
In pursuance of sect. 1 (4) of the Factory and Workshop Act, 1901, I hereby grant to factories and parts of factories which have been painted with at least two coats of a washable water paint as defined below, and repainted with at least one coat of such paint once in every three years, a special exception that the provisions in subsection (3) of said section with respect to limewash shall not apply thereto.

That the paint shall be washed at least in every fourteen months.

That the name of the paint used and the address of the makers of the paint, together with a certificate, in the form shown in the schedule hereto, from the makers of the paint, and the date of the original painting of each washing and repainting, shall be entered in or attached to the General Certificate.

That nothing in this order shall be taken to oblige the obligation of keeping the factory cleanly state, as prescribed by subsection of the said section.

That if it appear to an inspector that part of a factory to which the exception is not in a cleanly state, he may, by written notice, require the occupier to lime-wash, or paint the same; and in the case of the occupier failing to comply with requisition within two months from the date of the notice, the special exception shall not apply to such part of a factory. This order a washable water paint means washable paint which, when finished for contains:—

- i.) At least half its weight of solid pigment containing not less than twenty-five parts by weight of zinc sulphide as zinc white (lithopone) in each hundred parts by weight of solid pigment; and
- ii.) At least ten parts by weight of oil and varnish to each hundred parts by weight of solid pigment.

LEICESTER BUILDING TRADE EMPLOYERS AND THE INSURANCE BILL.

The following letter has been sent to local members of Parliament with reference to the Local Insurance Bill on behalf of the Leicester and District Building Trades Employers' Association:—
Sir,—This Bill was considered by the Local Council of this association at its meeting on the 19th inst., and we strongly protest

against the apparent hurried passing of the Bill before it has been properly considered and amended so as to be fair to all parties. We desire to lay before you the following general objections which we have to the Bill:—

1. Much disappointment is expressed that in preparing the Bill the Government have not proposed some amelioration of the Workmen's Compensation Act, which becomes every year more burdensome, and which is now costing from four to six times as much as it did at first, with a further large increase in prospect, instead of which such references as are made to that Act are considered to be in the direction of increasing the cost of administering it.

2. It is considered that the selection of a limited number of trades to be experimented upon in connexion with unemployment insurance is unfair, and that the building trade, which has now suffered a long period of depression, is ill-fitted to bear the further set-back which will follow the increased cost of production involved in this further burden. That Part II. of the Bill is admittedly in complete, and amounts to legislation by reference of a most objectionable type. That, therefore, this part of the Bill ought to be held over for the present.

3. That it is a matter of deep regret that the views of associations of employers were not ascertained during the preparation of the measure, seeing they are so deeply interested. That other classes concerned have enjoyed an advantage in this respect, which has been denied to us, and that it is unfair, therefore, to push the measure through as quickly as appears to be intended.

4. It is objected that employers, as such, receive no benefits from the Bill, except such as are shared by the professional and insured classes, that, therefore, it is unfair to require contributions directly from employers. It is a national scheme, and the whole nation should bear the cost. To put this charge upon employers is really raising wages by legislation. It is suggested that the employers will pass on these charges to the consumer, but if they do the cost of their products will be enhanced, and higher prices tend to curtail demand, which in turn tends to diminish production, and so creates unemployment.

We have also specific objections to Clauses 2, 11, 13, 41, 43, 46, 51, 63, 66, 68, 70, 71, 72, 74, and 79, which we would be pleased to furnish you with if you feel interested. This Association consists of upwards of 160 members, of various political views, and you can, therefore, take it that it is representative of the feeling of the building trade in Leicester. We are supported in our action by the National Federation of Building Trade Employers of Great Britain and Ireland, and the matter is being further dealt with at the half-yearly meetings at Newcastle-on-Tyne next Tuesday and Wednesday.

We trust, in the interests of the building trade and the country at large, that you will give this matter your most careful consideration.

F. BECK, President.
S. A. DOVE, Secretary,
Leicester and District Building Trades Employers' Association.

GENERAL BUILDING NEWS.

NEW CHURCH, CARDIFF.

The new Roman Catholic Church has been erected by Messrs. James Allan, Ltd., builders, of Cardiff, at a cost of about 9,000. Mr. F. R. Bates, of Newport, was the architect, and the seating accommodation of the church is for 600.

ST. JOHN'S CHURCH, MEADS.

The enlargements to this church have been carried out at a cost of about 10,000. by Messrs. Dove Bros., of Islington, London. The architect for the work was Mr. A. R. G. Fenning, F.R.I.B.A., and the reredos and baptistry were designed by Mr. Arthur C. Blomfield, F.R.I.B.A. The stained glass windows are by Messrs. James Powell & Sons.

NEW CHURCH, NEWCASTLE.

This Primitive Methodist Church is being erected at Cross Heath at a cost of about 350. The contract is being carried out by Messrs. J. Broadhurst & Son, builders, of Burslem, and the architects are Messrs. E. T. Watkin and J. Adams, of Burslem.

NEW CHAPEL, MACSTEY.

The estimated cost of this chapel is 3,600. and it has been erected from the designs of Mr. Beddoe Rees, architect, of Cardiff. The builders were Messrs. Turner & Sons, of Cardiff.

NEW BANK, NEWCASTLE.

The London Joint Stock Bank proposes to erect new banking premises in Grey-street, Newcastle, and plans have been prepared by Mr. W. H. Brierley, F.S.A., F.R.I.B.A.,

architect, of York. The contractor is Mr. Thos. Lumsden, of Jarrold.

CONSERVATIVE CLUB, WALTON.

The foundation stone of this building was laid on the 15th inst., and the estimated cost of the erection of the new premises is about 1,000. The designs have been prepared by Mr. Alfred C. M. Lillie, architect, of Bamber Bridge, and the builders are Messrs. G. Wood & Sons.

NEW LIBERAL CLUB, YARMOUTH.

Mr. S. E. Tomkins was the architect for these new buildings, which have been erected at a cost of 235, and the contract was carried out by Mr. F. O. Russell.

NEW LABOUR EXCHANGE, HEREFORD.

This new building has just been opened by the Mayor of Hereford. It is built of steel construction, with red terra-cotta facades, forming an imposing architectural feature on a corner site of one of the principal streets of the city. The architect is Mr. Ernest G. Davies, of Hereford, and the builder Mr. W. C. Bolt, of the same city.

UNITED BUILDERS' ALLIANCE.

The promoters of the newly-established United Builders' Alliance convened a meeting for Wednesday evening at the Athenæum, Muswell Hill, but, as there were less than a dozen gentlemen present an hour after the proceedings were timed to commence, it was decided to postpone the meeting until October.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with (the names of the applicants are given in parentheses).

Line of Frontage and Projections.

Battersea.—One-story shop in front of No. 89, Lavender-hill, Battersea (Messrs. E. Heather & Sons).—Consent.

Hackney, North.—Addition at No. 206, Upper Clapton-road, Hackney (Mr. H. C. Webster for Lady Amherst of Hackney).—Consent.

Hammersmith.—Projecting illuminated sign at No. 24b, King-street, Hammersmith (Mr. L. E. Jolly).—Consent.

Hampstead.—Projecting porch at a house on the north-western side of Antrim-street, Hampstead, westward of Haverstock-hill (Mr. S. C. Lathbridge for Mr. J. Russell).—Consent.

Paddington, South.—Erection of a building on the southern side of Harrow-road, Paddington (Mr. T. M. Wilson).—Consent.

St. Pancras, West.—One-story building to abut upon the south-western side of Delancey-street and the south-eastern side of Stanhope-terrace, St. Pancras (Messrs. Dolman and Pearce).—Consent.

Wandsworth.—Five projecting lamps at Nos. 79, 81, 85, 87, and 89, Streatham High-road, Wandsworth (Mr. A. Stokes).—Consent.

Wandsworth.—One-story shops in front of Nos. 200 to 214, Putney-bridge-road, Wandsworth (Mr. T. Jones).—Consent.

Woolwich.—Church building on the northern side of Eltham High-street, next to "Eagle House" (Messrs. Scoles & Raymond for The Rev. Abbot White).—Consent.

Width of Way.

St. Pancras, East.—Building upon a site abutting upon the northern side of Jeffroy's place, Kentish-town, and the eastern side of Priory-place (Mr. C. H. E. Bridgen for Mr. T. B. Westacott).—Consent.

Width of Way and Construction.

Fulham.—Two temporary wood and iron buildings in a yard on the eastern side of New King's-road, Fulham (Cole & Shuttleworth, Ltd.).—Consent.

The recommendation marked + is contrary to the views of the metropolitan borough councils concerned.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ASHBOURNE.—Factory. Clifton-road, for Messrs. Neale.

Ashton Manor (Warwickshire).—Head quarters for Army Service Corps at Aquarium (730); Messrs. Woodward & Mills, builders, 85, Cox-street West, Balsall Heath, Birmingham.

* See also our list of Competitions, Contracts, etc., on another page.

Ashton-under-Lyne.—House, Stamford-park (5,000.); Mr. J. T. Earnshaw, Surveyor, Ashton-under-Lyne Town Council.

Barking.—The following plans have been passed:—Four houses, Devon-road, for Mr. G. Clark; five houses, Wilmington gardens, for Mr. J. Ranson; five houses, St. John's road, for Mr. R. H. Carter; pipe factory and manager's house, Abbey road, for Messrs. Deguin & Son.

Barnet.—Offices for the Clerk (440.); Mr. G. D. Byfield, Clerk, Board of Guardians, Barnet.

Barnsley.—Extensions to public baths; Mr. S. H. Taylor, Surveyor, Barnsley Town Council (architect not yet appointed).

Barton.—Proposed alterations to Wesleyan Day School; Mr. S. M. Grant, Secretary, Lindsey Education Committee, Lincoln.

Bellsbush.—Picture palace (2,000.); Mr. J. Wilson, architect, Oakfield-chambers, Brandon-street, Motherwell.

Benula.—Shooting lodge (5,000.); Messrs. Cameron & Burnett, architects, Academy-buildings, Inverness.

Bideford.—Central fire station; Mr. R. E. L. Hookway, Surveyor, Bideford Town Council.

Birmingham.—Proposed central bathing establishment for ladies; J. Cox, Engineer, Baths Department, Birmingham Town Council.

Blackhill.—Roman Catholic Schools; Mr. J. A. Coyle, architect, 30, Kingley-terrace, Newcastle.

Bognor.—Twelve houses; Mr. O. A. Bridges, Surveyor, Bognor Urban District Council.

Bridgend.—Schools (5,000.); Mr. D. P. Jones, architect, 62, Charles-street, Cardiff.

Bridgend, N.B.—House (2,500.); Messrs. Jenkins & Mass, architects, 16, Bridge-street, Aberdeen.

Brighton.—Receiving houses (5,000.); Mr. Hawker, architect, North-street, Quadrant, Brighton. Hospital; Mr. Hawker, architect, North-street, Quadrant, Brighton.

Bristol.—Adaptation of upper floor of transit shed No. 2 for cold storage purposes (20,000.); Mr. W. W. Squire, Dock Engineer, Bristol Town Council.

Brynmain.—Schools (3,000.); Mr. D. P. Jones, 62, Charles-street, Cardiff.

Bury.—Weaving shed, Dumers-lane, for the Bury Co-operative Wholesale Society.

Canterbury.—Extensions to laundry, also house for nurses (1,250.); Architect, care of Mr. J. Plummer, Clerk, Board of Guardians, Canterbury.

Chester-le-Street.—Enlargement of hospital; Mr. J. H. Mole, Surveyor, Chester-le-Street Rural District Council.

Chichester.—Bacon factory; Mr. A. C. Harris, architect, Chichester.

Covenry.—Headquarters for Royal Field Artillery (Howitzer) Brigade (3,100.); Messrs. Clark & Sons, builders, Covenry.

Croydon.—Temporary buildings at Mitcham-road and Winterbourne-road Schools; Mr. J. Smyth, Surveyor, Education Committee, Croydon Town Council.

Crumpsall.—Additions to workhouse (2,400.); Mr. J. Macdonald, Clerk, Board of Guardians, Manchester.

Dulkeith.—Bank for Commercial Bank of Scotland (2,500.); Messrs. S. Mitchell & Wilson, architects, 13, Young-street, Edinburgh.

Dalton.—School; Messrs. Thornton & Sons, builders, 55, Glasshouse-street, Masbro', Rotherham.

Dewsbury.—Woolen mill, Earlsheaton; Messrs. Kirk, Son, & Ridgway, architects, Market-place, Dewsbury. New isolation block and infectious diseases hospital (3,000.); Messrs. W. & G. Thornton, architect, Dewsbury. Extensions to school, Chicken lane; Messrs. Holton & Fox, architects, Corporation-street, Dewsbury.

Doncaster.—Picture palace, French Gate; Mr. F. H. Johnson, architect, Priory-place, Doncaster. Woolen mill for Messrs. Gardenton & Sons; Messrs. Watson, Son, & Ellison, architects, Wakefield.

Dundee.—Power loom factory (4,000.); Mr. W. H. Lindsay, 215, Cleington-road, Dundee. Dyarst.—Extensions to stores of Co-operative Society (5,000.); Mr. D. F. Smith, 210, High-street, Kirkcaldy. School (4,000.); Mr. D. F. Smith, 210, High-street, Kirkcaldy.

East Cowes (Isle of Wight).—School (3,500.); Mr. Meader, builder, care of Mr. F. G. Flux, Secretary, Education Committee, Isle of Wight County Council.

Eastwood.—Wesleyan Methodist Church (650'). Mr. A. J. Davidson, builder, Leigh, Eddercliffe. Stores, Frost-hill, for the Liverpool Mutual Co-operative Society.

Edinburgh.—Extensions to academy, Inverleith-place (1,500.). Messrs. Leadbitter, Fairley, & Riell, architects, 17, Young-street, Edinburgh.

Exeter.—Fox's Bank; Messrs. E. H. Harbottle, architects, County-chambers, Exeter; Messrs. Stephens & Son, builders, Fore-street, Exeter.

Exmouth.—Extensions to Cathedral Convent Secondary School (2,000.); Mr. E. E. Ellis, architect, Imperial-road, Exmouth.

Framwellgate Moor.—Premises for Co-operative Society; Mr. L. G. Ekins, Co-operative Society, West Blandford-street, Newcastle.

Glasgow.—Additions to Fulsdale Means for Mr. Wallace Fairweather (2,500.); Messrs. F. Barnett & Boston, architects, 150, Hope-street, Glasgow.

Glencannich.—Shooting lodge (5,000.); Messrs. Cameron & Burnett, architects, Academy-buildings, Inverness.

Golspie.—School (1,880.); Mr. D. Ed. Harne, architect, Golspie.

Halifax.—Extensions to workhouse (1,500.); Mr. W. C. Williams, Commercial-street, Halifax.

Hamilton.—New halls, workshops, etc., for Co-operative Society (2,000.); Mr. James Lockhead, Brandon-chambers, Motherwell.

Harborne.—Proposed baths, Lordswood-road; Mr. J. Cox, Engineer, Bath Department, Birmingham Town Council.

Haydon Bridge.—Thirteen houses, Bridge-wood Estate, for the Haydon Bridge Co-operative Society.

Hayward's Heath.—Eliot Cottage Hospital; Messrs. F. Wheeler & Godman, architects, Bank-chambers, Horsham; Mr. H. Finch, builder, Hayward's Heath.

Hebburn.—New offices for Messrs. Hawthorn, Leslie, & Co.; Messrs. Boyd & Groves, architects, Emerson-chambers, Newcastle.

Hednesford.—Technical Institute (1,670.); Mr. H. Dawes, builder, Cradley Heath.

Hindley (near Wigan).—Billiard hall (1,670.); Mr. H. Booth, 42, Regent-street, Haslingden.

Hindport.—School (5,000.); Mr. A. Race, Town Hall, Barrow-in-Furness.

Hull.—Christian Science Church; Messrs. J. D. & S. J. Mould, architects, Walmersley road, Bury.

Huthwaite.—Public Library; Mr. G. Boscock, Surveyor, Huthwaite Union District Council.

Inverness.—Extensions to home for blind (3,500.); Mr. W. McIntosh, architect, 62, Academy-street, Inverness.

Kenmare.—Thirty houses (about 1271. each); Mr. W. Jennings, builder, Ballinrobe.

Leicester.—Extensions to asylum (3,500.); Mr. E. G. Mowby, Town Hall, Leicester.

Leek's Heath.—Extensions to school (4,000.); Mr. H. L. Growther, Council Engineer, Southampton.

Longsight.—Industrial school (2,300.); Messrs. Holt & Ratcliffe, 17, St. Anne's-square, Manchester.

Lunley.—New school (5,000.); Mr. W. Rushworth, architect, Shire Hall, Durham.

Mavron.—New school (3,000.); Mr. C. W. Best, County Architect, Brecon.

Melton Mowbray.—School; Mr. E. G. Fowler, 35, Bowling Green-street, Leicester.

Merchiston Castle.—Additions to school; Mr. J. M. D. Peddie, 8, Albyn-place, Edinburgh.

Morley.—Extensions to Daisy-hill Mills; Mr. T. A. Buttery, architect, Queen-street, Morley, Yorks.

Movar.—Villa (2,150.); Mr. J. G. Falconer, architect, 4, Cameron-square, Fort William.

Natherton.—School (5,000.); Mr. J. P. Osbourne, architect, 95, Colnacre-row, Birmingham.

New Barns.—Council schools (5,000.); Mr. A. Race, Town Hall, Barrow-in-Furness.

Newcastle-on-Tyne.—Additions to cottage homes (4,800.); Messrs. E. Henderson & Son, builders, Ponteland.

Newcastle-under-Lyme.—Billiard hall (1,600.); Mr. H. Booth, 42, Regent-street, Haslingden. Picturedome (2,500.); Mr. H. Booth, 42, Regent-street, Haslingden.

Northampton.—Secondary school for girls; Sharnham and Archer, architects, 3, Market-street, Wellington. The following plans have been passed:—Four houses, Birchfield-road, for Mr. G. W. Souster; eight houses, Dundee-street, for Mr. W. Higgins; four houses, Fleet-street, for Mr. W. Lewis; five houses, Dundee-street, for Messrs. C. & E. Lewis; six houses, Raymond-road, for Mr. T. Higgs; three houses, Forfar-street, for Mr. J. W. Gosage.

North Ormesby.—Alterations to girls' school (540.); Messrs. W. King & Son, Ltd., builders, North Ormesby.

Norwich.—New shops for A. Banting & Co., Ltd., St. Stephen's-corner; Mr. A. F. Scott, architect, Castle Meadow, Norwich.

Nottingham.—Adaptation of premises, Edwards lane Estate, into children's home (2,730.); Messrs. Gilbert & Hall, builders, care of Mr. G. M. Howard, Clerk, Board of Guardians, Nottingham.

Oswaldtwistle.—School (8,000.); Mr. Little, architect, Ribblesdale-place, Prescot.

Paisley.—Extensions to carpet factory; Messrs. R. Jack & Co.; Mr. T. G. Crombie, architect, 1, County place, Paisley.

Peterborough.—Reconstruction of (1,888.); Mr. W. H. Wycherley, builder, care of Mr. J. C. Davies, Secretary, Education Committee, Denbighshire County Council, R. Peterborough.

Peterborough.—Extensions to school (3,500.); Messrs. Brown & Watt, architects, 17, U. street, Aberdeen.

Ponteland.—Extensions to homes (5,000.); Mr. E. Bowman, architect, County-chambers, Newcastle-on-Tyne; Messrs. E. Henderson & Sons, builders, Ponteland.

Portsmouth.—Proposed eighty-six houses for the Faldou Colliery Co.

Rotherham.—Wesleyan Reform Church, Dalton Brook (650.); Mr. D. B. Jenkin, architect, Imperial-buildings, Rotherham.

L. Brierley, builder, Rotherham. U. Methodist Chapel (3,250.); Mr. James T. architect, Moorgate street, Rotherham.

Charles Greens & Sons, builders, Rotherham.

Rhyhope (Sunderland). New school (6,000.); Mr. E. Eltringham, architect, Central-barns, Newcastle.

Sidmouth.—Three residences (3,000.); R. W. Sampson, architect, Station-road, South Devon.

Skelton (Yorks).—Twenty artisans' dwellings (4,500.); Mr. W. P. Robinson, Surveyor, Skelton and Brotton Urban District Council.

Skinnergrove.—Enlargement of school (2,500.); Mr. T. Willoughby, builder, 1, End, Netherton, Yorks.

Steyning.—Alterations to grammar school (1,940.); Messrs. Sandell & Sons, builders, Railway-approach, Worthing.

Stockport.—Buildings for imbeciles & epileptics (25,000.); Mr. C. T. Johnson, Clerk, Board of Guardians, Stockport.

Street.—Housing scheme (7,500.); Mr. Pursey, Surveyor, Street Urban District Council.

Sunderland.—School (12,000.); Mr. C. Brown, Fawcett-street, Sunderland.

Swansea.—The following plans have been passed:—Garage, rear of 116, St. Helier avenue, for Mr. M. J. Thomas; eight houses, Pantygwydr-road, for Mr. J. Jenkins; additions, Salem Chapel, N. corner road, for the trustees; additional offices, Worcester place, for the proprietors of the *Cambria Daily Leader*; garage, Orchard-street, for Mrs. A. E. Richards; five houses, Queen's-road, Coedseacon, for Mr. F. Hoskins; alterations, Bersford House, minor road, for Mr. Evan Evans. Plans have been lodged for lodging house, Stranc Road, Mr. D. Vaughan.

Swinton (near Rotherham).—Parish School; Mr. E. J. Knight, architect, 33, College-street, Rotherham.

Tatlow.—St. Nicholas' Parish Church (8,000.); Messrs. Honour & Son, builders, Akeman-street, Tring.

Temple (near Glasgow).—Extensions to laundry, for Messrs. Burton & Co. (1,800.); Mr. T. Abercrombie, architect, 1, Col. place, Paisley.

Thirsk.—Proposed alterations to school hospital; Mr. R. R. Wright, Surveyor, Thirsk Rural District Council.

Thrimpton.—School; Mr. E. G. Fowler, Bowling Green-street, Leicester.

Ushaw-Church (2,500.); Mr. J. W. Phillips, architect, Merton-chambers, castle; Messrs. Todd & Son, builders, 4, Ton Wiske, Northallerton.

Wareham.—Territorial headquarters; Messrs. Fletcher, Son, & Brett, architects, Dorchester.

Wellington.—County schools (4,000.); Mr. Robinson, Caxton House, Westminster, S.W.

Wells.—Additions to Boys' Blue S. (1,800.); Mr. A. J. Pector, architect, Br. Somerset.

Whitecraigs.—Villa (2,200.); Mr. H. Clifford, architect, 225, St. Vincent's-gate, Glasgow.

Whittingham.—Annexe to county school (117,250.); Messrs. E. Taylor & Co., builders, Eber Works, Littleborough.

Whittle-le-Woods.—Offices, Low Mill Works for the Calico Printers' Association.

Willisley.—County school (2,750.); Mr. Robinson, Caxton House, Westminster, S.W.

Willington.—Forty houses for the Willington Co-operative Society.

Woodhouse Rostick.—New residence (1,500.); Messrs. Sharp & Waller, architects, Bridford road, Brighouse.

Wrexham.—Alterations and additions, congregational schools (1,350.); Messrs. D. Bridgewater, & Porter, architects, 3, T. row West, Birmingham; Mr. C. Gri. builder, Lye, Stourbridge.

Yarmouth.—Extensions to police and stations; Mr. J. W. Cockrill, architect, Yarmouth.

LAW REPORTS.

OFFICIAL REFEREE'S COURT.

(Before Mr. MUIR-MACKENZIE.)

A hearing was again resumed last week the action brought by Mr. F. G. Minter, contractor, whose headquarters are at 25, against Mr. Charles Waldstein, Proprietor of Art at Cambridge, from whom the plaintiff claims 2,750*l.*, the amount said to be due in pursuance of a certificate of Mr. Frederick William Foster, an architect, and in respect of a contract made between plaintiff and defendant for the carrying out of alterations and additions at Newton Hall, near London. Defendant raises a number of allegations of defective work, and presents a counter-claim for 10,000*l.*

Further evidence was called on behalf of plaintiff's case.

Edmund F. E. Kendall, the manager of Cambridge branch of Smith's Timber Company, Ltd., who supplied for Newton Hall the timber, with the exception of that in the chimney, declared that its quality was sound and good, and also well-seasoned.

H. T. A. Chidgey, quantity surveyor, residing in the Adelphi, Past-President of the Quantity Surveyors' Association, gave evidence concerning the quantities and also as to cost of work.

Frederick William Foster, architect, residing at 26, Bedford-row, informed plaintiff's leading counsel, Mr. Lewis Thomas, that he was articulated in 1876, and for years had obtained practical professional experience with Messrs. Cubitt, the known contractors. During that time he erected very large buildings, amongst one for Mr. Alfred Rothschild, that cost a quarter of a million, and that was in his supervision from start to finish. He had also been responsible for the carrying out of architectural work for members of the Royal Family, for peers, and for nobles.

Thomas: Have you ever had before the tender friction with any of your clients?

Foster emphatically replied, unhesitatingly, "Never!" and, proceeding, said that he was either in September or October, 1909, he was consulted by Professor Waldstein regarding the alterations and additions to Newton Hall. As was customary, witness stated the preparation of plans to his then assistant, Mr. Gill, who, an architect, now an assistant to the architect to the Duke of Westminster. Mr. Gill, at the period in question, worked in a room adjoining his at 25, and was therefore in constant touch with him. Witness would rough-out details and hand them over to Mr. Gill, who would be the working drawings and submit to witness for his observations. He had then, Mr. Gill's authority, to go from time to time to Newton to act on his behalf when he could not go. But witness had often seen and he saw the work which had been done out since his last visit. The work was, really speaking, carried out to his approval. Mr. Green, the clerk of the works, had come up to London from time to time with points that needed solution. He supplied the answers, and Mr. Green's authority to see the orders carried out. Such orders as Mr. Green gave, he (Mr. Foster) entirely accepted the responsibility. He gave further evidence to show that for variations had been carried out at the instance of Professor and Mrs. Waldstein. He stated that among architects Mr. Minter looked upon as a very good builder, and that, too, a particularly good reputation as joinery and very large joinery works. Mr. Thomas: Is there the slightest ground suggesting that the stability of this house is any danger whatever?—Not the slightest. He said that the brickwork and mortar were all right. He saw no evidence of weakness in the floors. He also quite approved of the timber.

Foster, continuing his evidence, stated that up to January 11 of this year, the occasion of his last visit to Newton Hall, relations with the Professor were most friendly. At that time there was no suggestion of his supervision, or any suggestion that Minter had not discharged his obligation. The details might have been criticised, but he was no complaint as to the general progress of the work.

Clavell Salter (cross-examining for the defence): Before beginning this job did you sign the contract?—Yes. It was an ordinary A.A. contract.

He was presented the contract, filled it in, and signed it to the Waldsteins for signature?—Yes. He saw many contract drawings were there?—Not say.

Did you take the trouble to insert their name?—I am not sure.

In fact, you left it in blank? That may be. Did you think that was protecting your client's interest? Yes, because the drawings were signed. Continuing, he said his impression was that the contract drawings were signed by Professor Waldstein, but he could not say so definitely.

Should they be?—Yes. Did you look to see if they were?—I think not. I was under the impression they were signed, but I cannot recollect what transpired.

In the autumn of 1909 you had many conferences with Mr. and Mrs. Waldstein before they embarked on this building?—Yes, as far as I can remember.

Were they not most emphatic that, if they built, everything must be of the soundest and best? Yes.

I think they are both very artistic people. But did they not otherwise make it clear to you from the first that, if there was a question between sound work and decorations, the decorations must give way to sound work?—I have no distinct memory of any particular discussions at that point.

But they were very anxious and particular from the first as to what this building should cost?—Yes. Witness added, however, that he had no recollection of telling Mr. and Mrs. Waldstein that, in his opinion, it would cost about 7000*l.* to build a house from his plan. He might have quoted a rough sum. There were extras to bear in mind.

You always found Mr. and Mrs. Waldstein exceedingly courteous and friendly?—Yes, exceedingly.

Notwithstanding that, did they not complain of what I must call unbusinesslike conduct on your part?—I think not. In answer to further questions, Mr. Foster said he had no recollection of Mr. and Mrs. Waldstein saying they could not go beyond 12,000*l.* at the outside.

Did you not discuss with them, Mr. Foster, whether to have the tender reduced to 12,000*l.* by reducing what had to be done, and starting with a tender of 12,000*l.*, or to leave the tender as it was and effect reductions as the work went along?—I believe that was discussed.

Mr. Salter asked Mr. Foster whether, when he received a letter from the defendant's solicitors requesting him not to grant any further investigation on the part of Mr. Waldstein, he did not gather that Mr. Waldstein did not desire him to act further as architect in this contract.

Mr. Foster: No. I had no intimation that I was not to remain as architect. Perhaps I may add that eventually Professor Waldstein told me that, whatever happened in these proceedings, he hoped it would make no difference to our friendship.

In answer to further questions, the witness said that Mr. Minter called on him on January 20, when he gave him a certificate against Mr. Waldstein for 2,750*l.* He was perfectly aware that when he gave that certificate he was doing so in violation of the instructions of his client. Mr. Minter had told him on that occasion that it would be possible to sue him (the witness) if he did not grant him the certificate. But that statement had no weight with him, but he knew his position. He was advised that an amount was due to the contractor, and accordingly he had to issue the certificate and leave the client to withhold payment if he thought fit. Witness had acted on his own initiative, and had looked neither right nor left. He gave the certificate in accordance with the terms of the contract. He had no power to withhold it, otherwise he should have leant towards his client. Witness subsequently admitted that, when the defendant's solicitors wrote requesting him to hand over all his architectural documents and issue no further certificates until further notice, he practically understood that he was suspended from his duties as an architect.

Questioning Mr. Foster concerning the timber, Mr. Salter asked him what right had he to bind his client to accept only "good, sound quality" when he had stipulated on his behalf for the "very best."

Mr. Foster: "Good, sound" is a general term, having reference to building and framing purposes, but having no reference to any particular grade. Any architect in London will tell you that the difficulties of getting specified timbers are well-nigh insuperable.

The Official Referee: An ordinary man in the street like myself wonders, then, why you put "very best" in.

In answer to another question, the witness admitted that 10 or 15 per cent. of the timber was "a bit shaky." He had never had to build so large a house under such conditions before. Whatever defects there might be in this case he attributed to the extreme rapidity at which the work at Newton Hall had to be done. He had not, too, anticipated so much heat being applied for the drying of the house. Under

the circumstances, he knew that something would have to go.

Mr. Salter: When you allowed your client to stipulate that the work should be finished by August 1, did you warn him that something must go?—I think not.

Have you ever seen a new house that anybody built in such a state as this a year after completion?—I cannot call to mind any particular house.

The case was proceeding when we went to press.

HIGH COURT OF JUSTICE, CHANCERY DIVISION.

(Before Mr. Justice EVE.)

Injunction against Builders.

Nash v. Spencer, Santo, & Co., Ltd.

In this case Mr. Clayton, K.C. (with him Mr. Dighton Pollock) moved on behalf of Mrs. Nash and others against Messrs. Spencer, Santo & Co., Ltd., builders, of Westminster, for an injunction to restrain the defendants from causing a nuisance by noise and vibration proceeding from the defendants' works, which were the rear of the plaintiffs' houses in Paye-street, Earl-street, and Hudson terrace, Westminster. For some time the defendants had been carrying on their works during the whole of the night, and using an engine and stone-sawing and other machinery. It had created an intolerable nuisance, both by noise and vibration. The occupiers of the houses complained that they were rocked in their beds rather more than they liked, and the only answer the defendants made was that they were busy, and that they must complete their Law Courts contract, and must go on with day and night shifts.

Mr. Justice Eve said that the contract for the Law Courts did not seem to be going on very fast.

Mr. Clayton said that he had got evidence of several tenants of the most pathetic character as to the persistence of the nuisance. It was all small property, and let to weekly tenants, who were threatening to leave. He asked for the injunction.

Mr. Lawrence, K.C., said the defendants were working day and night to complete the contract at the Law Courts. They had told the plaintiffs that there would not be any night work after the 28th of July. Until that time they would have to work a night shift because they were under heavy penalties, and it would be a very serious matter to them if they were not allowed to do so. The damage to the plaintiffs would be very inconsiderable, because if the tenants left, the plaintiffs could only get fresh ones, as there was a great demand for the houses.

Affidavit evidence was read on both sides. The plaintiffs' evidence alleged that windows vibrated, and rest at night had been destroyed for over a fortnight. The defendants' affidavits showed that the plant was an electrical one, and that no engine had been worked for some months past, and that it would take four or five weeks to shift the electrical plant to another site. On the question of public convenience it was important that the contract at the Law Courts should be completed, and the defendants should not, therefore, be prevented from working. In the short time available, counsel added, the defendants had not been able to properly meet the plaintiffs' evidence.

Mr. Clayton submitted that no answer had been given to the plaintiffs' case, which showed *prima facie* that an intolerable nuisance existed. No amount of negative evidence could disprove the positive statements made on behalf of the plaintiffs. The defendants could not meet the plaintiffs' case as to damage by saying it was easy to get fresh tenants. The plaintiffs had rights which they were entitled to have protected.

Mr. Justice Eve said that even if he granted an injunction, he would probably suspend it to give the defendants an opportunity of remedying matters.

Mr. Lawrence said he was willing to give an undertaking not to work after 10 p.m. from July 28, if the plaintiffs would give an undertaking in damages.

In giving judgment, Mr. Justice Eve said that the defendants had to get rid of a large quantity of stone within a limited time, and in June last they had to start a night shift. It was quite clear that a great deal of the work of stone-cutting for the purpose of fulfilling the contract at the Law Courts was done during the night. The plaintiffs, who had not been precipitate in taking account, discovered that the rest of their tenants had been disturbed by the noise. Against the evidence of the plaintiffs, that of people who were not disturbed had been put in, but his lordship thought that there was a certain number of people whose consciences were either so blunted or so pure that they could get their rest at night, despite any noise. A con-

tractor's yard outside an open bedroom window was calculated to cause great annoyance and discomfort. Persons ought to conduct their businesses with due regard to the comfort of the average man or woman, and he thought there was sufficient evidence before him to prove a nuisance by noise at night. He did not attach much importance to the vibration complained of. The defendant company was being carried on by a receiver and manager appointed by the Court on behalf of the debenture holders, and while he sympathised with the plaintiffs, he must have regard to the interests of the defendants, and to the relative amount of inconvenience and loss involved. He thought the proper course to take was to grant an injunction to restrain the nuisance by noise at night, and to suspend the operation of it over the 28th inst., in order to give the defendants an opportunity of making some other arrangements. He further expressed the opinion that 10 o'clock at night was the latest hour at which the defendants ought to work noisy machinery.

The costs would be costs in the action.

(Before Mr. Justice EVE.)

Party Wall Dispute. Carden v. Layton.

On Friday, July 21, this case again came before his Lordship. The facts were fully reported in our issue of July 14.

Mr. Clayton, K.C., for the plaintiffs, said that Sir Alexander Stenning had now made his report, by which he found that the work already executed at 17 and 19, Goswell-street had been properly done, and in accordance with the requirements of the London Building Act, with the exception that the portion of the wall referred to in the writ had not been properly bonded into the party wall, and that in order to comply with the provisions of the London Building Act, such part of the wall as was not properly bonded ought to be taken down. Mr. Clayton submitted that on the report, the plaintiffs, who were quite satisfied with it, ought to have the relief they claimed. The defendants said it was an independent wall, but Sir Alexander Stenning had found it to be a party wall. If the defendants would give an undertaking to do what the report said ought to be done and pay the costs, the matter could be ended. There was a claim in the writ as to ancient lights, and the plaintiffs wanted to preserve their rights in this respect quite apart from the question of the wall.

Mr. Lawrence, K.C., for the defendants, said that his view was that the motion was misconceived.

Mr. Justice Eve said it appeared to him to be merely a question of costs now. The wall would have to be taken down.

Mr. Clayton said he was prepared to deal with the matter now, and all he wanted was an undertaking or a mandatory order.

Mr. Justice Eve asked whether Sir Alexander Stenning had made his report as third surveyor in the arbitration proceedings. He would like to have that report before him when he decided the motion.

Mr. Lawrence said he suggested there was no case against him to pull down. If the defendants did not comply with the London Building Act, it was for the authorities to interfere, and his case was that his clients had built under the supervision of the surveyors under the Act, and in a proper manner.

Mr. Clayton said he had a complete answer to that.

Mr. Justice Eve said that he would order the motion to stand over for a week, so that he could have the report of the third surveyor before him. When he got that he would decide all the points in the action.

Kensington Builder's Action:

A Remarkable Point as to a Contract.

In the King's Bench Division on Tuesday, July 18, before Mr. Justice Pickford, the non-jury action—Roodhouse v. Burt—came on for hearing. This was an action by the plaintiff, Mr. Robert Reginald Roodhouse, builder and estate agent, of 145, Hammer-smith-road, London, W., against Mrs. Edith Marie Stevens Burt, of Holland-road, Kensington, to recover 380*l.* 10*s.* 4*d.* for work done at the defendant's house, 94, Holland-road, consisting of alterations and repairs.

The defence set up was that the defendant did not enter into the contract with the plaintiff, but with his father, Mr. R. P. Roodhouse, trading as R. R. Roodhouse, and that the business carried on by R. R. Roodhouse was the business of R. P. Roodhouse.

Mr. G. Ricketts represented the plaintiff, and for the defendant Mr. Gore Browne, K.C., and Mr. Stuart Bevan appeared.

Mr. Ricketts stated that of the sums claimed, 14*l.* 12*s.* 2*d.* represented the balance due under the contract, and 365*l.* 18*s.* 2*d.* was for extras.

Counsel proceeded to explain that in regard to the large sum for extras, the contract had a clause which stated that the amount did not include stoves, kitcheners, and other necessary articles. The action arose out of an order of the Court of Appeal made by Lord Justices Fletcher Moulton, and Buckley, to the effect that in regard to the dispute between the parties, the evidence should be set down for trial as to whether the plaintiff was a person entitled to sue, and whether his father had authority to make a certain agreement, and whether the plaintiff was entitled to have an award set aside.

Mr. Ricketts said he would endeavour to show that the plaintiff was entitled to sue, and that his father had not authority to enter into the agreement.

Counsel proceeded to deal with the correspondence in the case, and said that at the end of 1904 the plaintiff had the business carried on at Hammer-smith by his father assigned to him. The work at the defendant's house was carried out by the plaintiff, and all the extras were ordered by Mrs. Burt, either through the plaintiff or his foreman. The work consisted of alterations and repairs to the defendant's house in Holland-road. The actual contract (it was admitted) was signed by the plaintiff, rather than his father's name, but the plaintiff had negotiated the contract, and he also carried out the work and frequently went with the defendant to various places of business to order goods for the equipment of the house.

Counsel explained that various letters in the case were written by the plaintiff's father, who had carried on the business up to 1904, and the plaintiff's father did interview the local surveyor at Kensington in regard to the work as affecting certain points under the London Building Act. In regard to the money in dispute, there had been arbitration proceedings, and a certain sum had been awarded, but this the plaintiff was not ready to accept, and he contended the award was not binding as he had not submitted to the arbitration. There had been an offer to pay half the amount of the award, a sum of about 83*l.*, but this plaintiff had refused to take. As the plaintiff could not get payment of his account, the writ was issued.

Counsel in his father had had no share in the business at all since the assignment to him at the end of 1904. His father now lived in the upper part of the office, and was 71 years of age. Witness received assistance from his father in the office, but he had never given him authority to bind him in regard to business transactions. The extra work at Mrs. Burt's house was carried on two months after the completion of the contract. When witness pressed for payment, Mrs. Burt said she had not got any money and could not pay him. He had no knowledge of his father signing any submission to arbitration. He heard that his father had done this when he came back from a summer holiday; but he declined to agree to what had been done, and he wrote to say the submission to arbitration had not been signed by him. He then gave instructions for his father to issue the writ.

Mr. Roodhouse said that the name "R. R. Roodhouse" was up in several places at his business, and also on his "Roodhouse" in one or two. The name "R. P. Roodhouse" was taken away when the business was taken over by witness.

Cross-examined, he said his father wrote all the letters and practically all the receipts for payments.

Mr. Gore Browne: Can you suggest any reason why he was signing the receipts when the contract was (as you say) with you?—I asked him to do so.

His Lordship: Why did you not sign receipts yourself?—I might have done so. Further questions were put to witness by counsel with a view to suggesting that his father was the principal and the plaintiff his manager. (Witness asserted that there was evidence in the documents that this was not the correct position.)

The hearing was adjourned. Further evidence was tendered subsequently, and on Friday his Lordship held that the plaintiff was the person entitled to sue, and ordered that the question of amount should be referred to a surveyor to be appointed by arrangement.

LONDON COUNCILS.

Berkhamstead.—Plans have been passed for Messrs. W. J. Wood & Son for an office, house, and music shop, etc., Lower King's-road, also for Mr. D. Pike for three warehouses.

Bermondsey.—The tender of Messrs. A. White & Co., at 87*l.*, has been accepted for the erection of a boiler house at the electricity works. The following plans have been passed:—Messrs. G. Potton & Son, 2 and 4,

Riley-street, Bermondsey, for the Govett of St. Olave's and St. Saviour's Grammar School, Tooley-street, S.E.; alterations to Parish-street; Messrs. Barlow & Roberts, 15, Redcross-street, Southwark, S.E., facade, Tower Bridge-road; Mr. J. M. Kenny, Tower Bridge-road; Mr. J. M. Kenny, Tower Bridge-road; Mr. J. M. Kenny, Tower Bridge-road, additions to 120, Tower Bridge-road.

Croydon.—Plans and estimates have been submitted by the Surveyor for making Florence-road, Sandhurst, at an estimated cost of 801*l.*, and St. Mary's-road at estimated cost of 738*l.* The Surveyor also submitted the final apportionment, making up Purley Knoll, Beddington, &c. he puts at 8*s.* 9*d.* per foot. The provision apportionment was estimated at 3*s.* 8*d.* tender of Messrs. E. & E. Iles, Wimbly has been accepted at 270*l.* for the execution of works in connexion with the new overhead at the Sewage Works at Merton. Plans and estimates submitted by the Engineer have been approved for construction of a sewer in Langdon-crescent, an estimated cost of 404*l.* The following have been passed:—Mr. E. J. Jenner, ten houses, Lancaster-road; Mr. J. Harri, five end-on—20, Ruarings, Barking-road; J. Clark, five houses, Kimberley-street. Plans have been lodged by Mr. A. J. Brer, for seven houses, Central Park-road, Gillingham.

Fulham.—The Borough Surveyor has been instructed to replace the pipes of Fulham road with 6 in. by 5 in. by 3 in. crocodile blocks at an estimated cost of 456*l.* Electric cables are to be extended to D Wharf, Rainville-road, at an estimated cost of 93*l.*

Hammer-smith.—The Borough Surveyor has been instructed to prepare plans and estimates for the making up of Standish. Tenders are invited for carrying out the work of extending the boiler house at the electricity works at an estimated cost of 456*l.*

Hemel Hempstead.—The Education Committee have accepted the tender of Messrs. P. Drew, of Kettering, at 3,238*l.*, for builder's work in connection with the school at Two Waters.

Leamington.—The District Council have passed plans submitted by Mr. F. Jones, four houses, Station-road, Chase B. Pinner.

Leamington.—The asphalt carriageway pavement at the junction of Tottenham Court-road and New Oxford-street has been taken up, and granite sets laid in lieu thereof at an estimated cost of 1,464*l.* Tenders are to be invited for the work. Parts of the asphalt carriageway pavements of Woburny, Kingsway, Kewell-street, Store-street, Russell-street, Broad-street, and Endell-street are to be re-laid at a cost not to exceed 2,510*l.* Plans have been passed for Mr. C. Waymouth for the erection of office warehouse premises on the site of 9, 10, 11, and 12, Lambeth.

Lambeth.—The 12-in. pipe relief sewer Bedford-road is to be extended at an estimated cost of 104*l.* The Council have decided to repair Cranmer-road with 18-in. asphalt, in lieu of broken granite macadam, at an estimated cost of 144*l.*, bringing the total to 310*l.* A plan has been passed for Messrs. Wakeford & Sons, on behalf of Mr. J. & R. Bax, for four buildings, Brixton, also for Messrs. Stringer Bros., for six bc Claverdale-road, Upper Tulse-hill.

Leyton.—The following plans have been passed:—Mr. J. Amis, nine houses, F road; Mr. C. W. Musgrave, addition to "Moorborough," Lemna-road; The J Construction Co., additions to Forest Lea Bridge-road.

Marylebone.—The tender of the P. Asphalt Paving Co., Ltd., has been accepted for the execution of asphalt works in Car street and James-street, at a cost of 1*l.* The Council have further accepted the tender of Messrs. Constable Hart & Co., and Mr. Smart & Sons, for tar macadam work 5,052*l.* and 441*l.* respectively.

Poplar.—Part of Gough-street, adjacent the Guardians' Offices, is to be paved with asphalt blocks at an estimated cost of 200*l.* A portion of the sewer in Leonard-street is to be reconstructed at an estimated cost of 840*l.* A plan has been passed for Mr. Harry Groves, on behalf Messrs. Fowler, Ltd., for additions to C house Wharf, Orchard-place.

St. Pancras.—The work of replacing Gordon-street with crocodile deal blocks, an estimated cost of 1,045*l.*, is to be put in hand at once, and carried out by labour. Information has been received of Messrs. Claudius Ash, Son, and Co., Ltd., to erect a new factory on the site of Nos. 4, 5, 6, and 6*a*, Anglers-lane; George A. Turner, 96, Gower-street, W.C., the architect.

Hamstown.—Plans have been passed as to Mr. H. G. Needham, three houses, venue; Messrs. H. Slow & Son, six Bellevue-road; Mr. W. J. Warboys, houses, Pembroke and Grove roads. A has been lodged by Mr. J. Dunn for hundred and fourteen houses in Elphinstone.

Lezworth.—Tenders are invited for paving-road, Springfield, and Guilders-road, Streatham, as new streets. The plan of Messrs. E. Parry & Co. has been at 312, for paving part of Edgley-Clapham, North, and laying Victoria road paving on footpaths. The following have been passed:—South London Streatham Estates, Ltd., eight houses, road, Streatham; Mr. D. Weston, vestry at Providence Baptist Chapel, road, Streatham; Messrs. Humm, Ltd., motor house, at No. 58, Upper road, Putney; Messrs. Humphreys, eight houses, Longstone-road, Streatham; Mr. K. J. Young, alterations and additions, No. 276, Baltham, High-road; Mr. H. L. motor garage, rear 140, Replingham-Southfield; Messrs. J. Garrett & Son, gymnasium, etc., at the premises at the Good Shepherd, St. Paul's Clapham, North; Mr. I. Davies, pavilion, High-street, Putney; Mr. Hammond, laundry, St. Ann's hill, Fair-

Ham.—The tender of William Griffiths has been accepted at 1,463, 11s. 8d. supply and laying of 8-in. cross-cut planks in Rathbone-street. Tenders are invited for wood paving a portion of the Dock-road at an estimated cost of £7. The following plans have been passed:—C. Watkins, alterations and additions, Ham Hospital, West Ham-lane; Stratford, Stratford; Mr. W. & T. R. Mil, alterations and alterations to Berwick Broadway, Stratford; Messrs. Burt, & Haywood, Ltd., offices, etc., Prince Street, Silvertown; Messrs. Cham-jett, & Ford, alterations to bakehouse, street, Silvertown; Mr. G. Allen, houses and shops, and altering four into shops, Rathbone-street, Canning Road. Plans have been lodged for Mr. W. C. for a cinematograph theatre, road, Custom House; also for Mr. for alterations and additions to and 5, Windmill-lane, Stratford.

Minster.—Repairs are to be carried out on Chester-road and Chester-square, at an estimated cost of 210, and 100, respectively. The Engineer has been instructed to tenders for paving the north portion of High-street with hard wood pavement, and pavement, and "strip" pavement. Plans have been passed for Mr. F. D. Ellmer, use on site of No. 70 and 71, York-Buckingham Gate.

Widen.—The Engineer has been instructed to prepare plans and estimates for the widening of Pound-lane. Plans submitted by the Engineer for the construction of a sewer in Neasden-lane, at an estimated cost of 470, have been approved. Tenders are invited for the culverting in of a course from Denzil-road to Dudden Hill. The tender of Mr. F. G. Brummell has been accepted for making up Coverdale-road (Herm-road). Designs are to be submitted by the Engineer at the next meeting of the Council for the construction of an under-convenience near the junction of Park-road with High-street, Harlesden. The main is to be extended at an estimated cost of 470.

TRADE CATALOGUES.

Messrs. Thos. Parsons & Sons have issued an ingenious device for showing their well-known "Endelline" and "Endellat" colours *in situ*. It is obviously an advantage to be able to see the effect of a decorative scheme without the expense of doing the work, and by means of the new contrivance any preliminary errors in taste may be avoided. The invention consists of a cover, 9½ in. by 11½ in., which stands up like a photograph frame. The oval centre shows the interior of a furnished room, with white walls and ceiling. By inserting slide-like cards, coloured in "Endellat" tints, the frieze, filling, and dado are seen with a variety of decorative effects. The idea is good, and as Messrs. Parsons suggest, other schemes can be made up to suit the requirements of architects.

Messrs. W. & J. George, Ltd., of Birmingham, send us a circular describing their improved theodolite, an instrument produced at very moderate cost and which is described as being sufficiently accurate for small land surveys. The horizontal circle is of 5 in. diameter, and has a vernier reading to four minutes; the vertical circle being also provided with a vernier. A special feature of the instrument is the new form of clamping arrangement, enabling the user to make a complete revolution of the instrument without moving the stand. The theodolite is furnished with compass and spirit level, and its low price brings the instrument within the reach of any student of surveying.

The Carron Company send us particulars of the new electric range which they have just placed on the market. The Carron electric combination cooking range consists of an oven, for roasting and baking, two hot plates, a double grill and toaster, and a hot closet. The hot plates and oven are each provided with two heats, by which the temperature may be forced at starting, and afterwards maintained at a lesser degree, with excellent economical results. The heating elements may be readily replaced without the necessity of returning the range to the makers. The oven of the 350 range is fitted with the "Carron" inner glass door, so that the food may be examined while cooking without loss of heat. Each range, besides being fitted with two switches for the oven, and one for each hot plate, has separate switches for the grills and hot closet, and two plugs and sockets for connecting to the main cable. The firm also manufacture electric radiators for the heating of private apartments, business premises, etc., where electricity is the lighting agent.

Twice to have borne a part in the pageantry of a Coronation is an achievement of which any firm might well be proud. The Tynecastle Co. of Tynecastle, Edinburgh, and 14, Rathbone-place, London, W., send us a specimen of the canvas hanging which they designed and manufactured for the interior decoration of the Annex of Westminster Abbey. Similar decorations were also carried out on the occasion of the Coronation of King Edward VII. The lengths of the material (No. 1,055, Tynecastle canvas) were sewed together to form large panels, which were hung loosely to the walls. The design has for its motive a conventional treatment of rose, shamrock, and thistle, and the whole surface is tinted in cindered ivory. The effect, to judge from the cutting before us, is excellent.

FOREIGN AND COLONIAL.

Labour in the Colonies.

From the Supplement to Circulars of Emigrants' Information Office, issued from 31, Broadway, Westminster, S.W., we learn that in New South Wales, in Sydney and suburbs, the following trades have been very busy:—Building, iron, furniture, timber, first grade labourers, and factory employees. In Victoria there has been plenty of work also for mechanics, such as builders, carpenters, and bricklayers, and there has been considerable scarcity of workers. In South Australia work of nearly all kinds is plentiful, and there is a good demand for bricklayers, masons, carpenters, plasterers, painters, blacksmiths, boiler-makers, and, in country districts, for unskilled labourers. In Queensland the Government is spending large sums of money on the construction of railways and other public works: there is, therefore, plenty of employment for most classes of labour and brickmakers are in demand in Brisbane. But at the same time there have been some labour troubles. In Western Australia there is a good opening for carpenters, trained mechanics for the construction of railway rolling stock, including carriage and wagon

builders, and plumbers. In the Transvaal the building trade continues brisk at Johannesburg, but there is no scarcity of white labour, and many carpenters, stonecutters, unskilled labourers, and men in the engineering trade are without work. In Cape Province there has been a demand at Cape Town for a few cabinet makers. The employment by the Isthmian Canal Commission of skilled labourers, clerks, and other higher-grade employees is now restricted to American citizens, except in cases in which American labour of the character required is not available. There is a surplus of skilled and unskilled labour on the Isthmus, and as the Canal Works are now within measurable time of being completed, it will soon be necessary to reduce the number of men employed. Intending emigrants are therefore warned not to proceed to Panama.

Timber for Furniture, Flooring, etc., Tunis.

H.M. Consul-General at Tunis (Mr. E. J. L. Berkeley, C.B.) reports that the owner of a property on which timber suitable for making furniture, flooring, etc., is stated to grow desires to get into touch with British firms who might be interested. The name and address of the inquirer may be obtained by British firms on application to the Commercial Intelligence Branch of the Board of Trade, 75, Basinghall Street, London, E.C. Any further communications regarding the inquiry should be addressed to the British Consulate-General, Tunis.

Tramway Stations, Austria-Hungary.
The *Oesterreichischer Zentral-Anzeiger* (Vienna) of July 9, announces that the communal authorities of Vienna have approved the plans for the erection of two tramway stations at a total cost of 3,731,000 kronen (about 155,000*l.*).

PATENTS.

APPLICATIONS PUBLISHED.*

- 15,314 of 1910.—Samuel Meador: Spanners or wrenches
- 15,485 of 1910.—John Barron: Water-closed basins.

OBITUARY.

Mr. R. Durnell.

Richard Durnell, founder of the firm of R. Durnell and Co., and contractors, established upwards of fifty years ago, and at his residence in Paragon-road, on Wednesday, the 5th inst. Some principal residences and mansions of Durnell and Co. were also erected by Durnell's firm, as were also several public works, and, in addition, the firm successfully executed several large contracts in the north and in the north of England. Durnell served on the directorate of several public companies. The late Mr. Durnell would have completed a year had he lived until the 16th of last month, was a Freemason. For years he served on the old Highway Board, and was superseded by the present authority in 1881. He also served on the Braintree Parish Council, was one of the founders of the poor, and one of the founders of the local schools. The funeral took place at Brasted.

THE PAST SESSION OF THE R.I.B.A.

WITH the advent of August there is a momentary lull in affairs architectural, or, at any rate, that aspect of them which comes daily under the head of architectural ics. The work of Committees suspended during the supreme holiday of the year; sessional meetings prorogued until October or November; and the action of movements various kinds remains to all appearance stationary. This cessation of flow of the political hour-glass is, ever, more apparent than real. day-time, in fact, provides much of oil for the political machinery; it provides opportunity for travel, recreation, and reflection: away from the din of mediate affairs the mind becomes more

susceptible of liberal views and more detached; the march of events is observed in something like its true perspective; physical energy is engendered, which makes for clearness of thought, for future steadfastness and progress. And out of the tumult of the busy six or nine months which have sped it enables one to distinguish the factors in the architectural world which have made either for advance or retrogression. It enables one to sum up the cost.

If we cast our mind back for a moment briefly to review the more important events of the past session we find that they arrange themselves under two heads, which we may style, broadly, domestic politics and public politics. We shall speak first of those which bear upon

matters of public importance. The outstanding event of the year under this heading was certainly the holding of the Town Planning Conference. The Institute of Architects has seldom, if ever, intervened so successfully in a matter which was, as it were, just on the threshold of popular interest. And it intervened at the psychological moment; at a moment indeed when the importance of the architect in a movement in which he should have been directly concerned was, if not quite overlooked, at any rate in danger to some extent of being disregarded. So far as the Town Planning movement had a following in this country, it was largely considered as an offshoot of the garden city movement! That is to say, it was looked upon first

of all as a sociological affair, as the means for the amelioration of the conditions of a class of people with small incomes. With that view we are, and always have been, heartily in sympathy. But the position of the architect in the scheme was not regarded as an essential element in its success. He was accepted, no doubt, as a person ultimately to be called in, as a useful man to measure up the site and make things look pretty. The Conference happily had the effect of changing all that; it broadened the basis of the popular view. And in this view we include the attitude of the daily Press, which had usually displayed deplorable unintelligence as to the position of architecture in any matters of the kind. Since last October there have been unmistakable signs of greater enlightenment in this respect. The value of the Conference so far as architecture is concerned was that the subject of Town Planning happened to strike the public imagination; its proceedings obtained wide circulation, and, above all, Town Planning became definitely associated in the general estimation with the work of the architect. Even more than that: we are inclined to believe that the Conference achieved, more or less fortuitously, an aim which has occupied the minds of those who have been concerned for some time in architectural progress. We cannot now cover the ground of the history of architectural politics during the last fifty years or so further than by indicating that there emerged out of what seems in later times to have been the somewhat absurd conflict known as the "battle of styles" a feeling that has gathered strength and conviction in recent years that before there could be a general levelling up in architectural practice there must be some development in the general understanding of architecture as a fine art. For, after all, during the latter half of the Victorian era the Mistress Art was certainly the Cinderella of the arts; the extremely humble sister, for instance, of the "subject" picture and romantic novel. We do not wish to enter into the arena of polemics, particularly in regard to ground of so wide an area, beyond affirming that we consider the absence of any general appreciation of the art of architecture to have been due in a large measure to the archaeological attitude and detachment of the architect himself. However this may be, the Town Planning Conference, in our opinion, had the effect of stimulating beyond the scope of its programme comprehension of an art to which the public were not so much indifferent as of whose scope and possibilities they were largely ignorant. This has been, we think, plainly evident in two recent matters of no less public than architectural importance. We refer to the St. Paul's Bridge and the King Edward Memorial. In each of these instances both the Press and public have realised the importance of the rôle that architecture should play in the development of the various schemes which have been prepared, and Parliament itself went so far in the case of the bridge as to refer back for further consideration the recommendations of the Parliamentary Committee. That the solution of either problem, as it stands, remains far from

satisfactory cannot be attributed to a lack of appreciation of the æsthetic stakes at issue by the unofficial layman. It would almost seem indeed as if opinion were gradually being formed outside official and expert circles in advance of that held by those with whom at present the final decision with regard to City improvements and public memorials rests. And the growth of this opinion was, no doubt, to some extent assisted by the discussions at the Town Planning Conference. This is a healthy sign, and will, we daresay, in the course of time make itself felt at the election of candidates for public bodies. When "the man in the street" once begins to be seriously interested his influence usually counts against the Philistines.

With regard to domestic politics, much of importance has occurred during the past session. The Copyright Bill at present before Parliament, although far from being an ideal measure, protects in its provisions architectural design against unfair piracy; we can only hope that it may not turn out to be a formidable instrument in the hands of the merely litigious person. The foundation of a British Architectural School at Rome has, too, come within closer view, and we wish the scheme every success. It will probably be many years before any organisation equal to that which is in operation at the Villa Medici will be effected, but the mere fact of the existence of the school, even in its initial stages, will give impetus to architectural education. When a distinction equivalent to the Grand Prix becomes the ultimate goal, the blue ribbon of student life in this country, there will, beyond question, be a general enlargement of the student's point of view. He is at present provided perhaps with too many distractions in the matter of bursaries and prizes, which carry equal weight in reward and appreciation. The value of the Grand Prix is that it centralises the aim and ambition of all the most able architectural students in Paris, without limiting the gift for original design, if we may judge by the work carried out in later life by the *anciens pensionnaires* of the Villa Medici. The Board of Architectural Education has during the past year advanced beyond the first stages of its formation, always a difficult time, and is formulating a practical system which will tend to improve the examinations as a test of the architectural qualifications of the students. We say qualifications rather than knowledge, because it is not so much by book learning, by sketching, or by memorising the features of such and such ancient buildings (important as these may be), as by the gift of design controlled by a grasp of the guiding principles of proportion and form that the future of our younger men as architects will depend.

Progress in the Registration movement has for the moment come to a standstill, in consequence of the new Charter which must be obtained by the Institute before any amalgamation with the Society of Architects can occur. There has meanwhile been a large accession in the number of Licentiates of the Institute, and if this class further increases it will operate largely in the same direction as an Act of Registration. We do not

anticipate any difficulty in the case of the Institute securing the approval of the Fellows and Associates for the Charter; but it would be a mistake to recognise that there is a considerable influential body of opinion within the Institute that is opposed to any sale amalgamation with any society—a body of opinion that prefer alliance to incorporation. If this opinion were to prevail in voting it would not necessarily mean a throwback to Registration. In view of the influences outside architecture, will, in any case, be brought to against a Registration Bill, it would carry optimism beyond the limits of practical politics to suppose that the Act of the sort could come into operation before many years of organised opposition. It would be absurd, therefore, to suppose that if, by a hazard of the draw, the amalgamation of the Institute and the Society is blocked, that a joint committee of both bodies could not agree on the principles of a Bill promoting the advance the interests of a common cause. In this event, when the new Statute Book we have a class of Registered architects which would necessarily, in the instance, include many men whose qualifications for practising architecture would be largely negligible, and a further class of men who would be able to add to their status that the law gives them a degree of this or that society. In the case of the Institute, the degree was conferred within the powers of a Charter, supported by a historical tradition which is, among modern architectural corporations of the world, the oldest and best established.

STATUTORY QUALIFICATION FOR SURVEYORS

CONFERENCE which has attracted the attention of the importance of its proceedings was held in

June at the Surveyors' Institution has recently issued its Report.

It was attended by representatives of the Commonwealth of Australia, New Zealand, New South Wales, Victoria, Queensland, Western Australia, Tasmania, Canada, the Ordnance Survey, the Institution of Civil Engineers, and the Surveyors' Institution.

Briefly, the object of the Conference was to examine the possibility of a uniform standard of qualification for surveyors throughout the British Empire. The proposal first emanated from the Government of New Zealand, and was submitted to the Colonial Conference in 1907 a resolution that reciprocal arrangements should be established between examination authorities throughout the Empire, that qualifying tests should be uniform, subject only to further tests as to Acts or regulations. This proposal, after being reported on by the Council of the Surveyors' Institution, was finally adopted by the Colonial Conference.

This eventually led to the official invitation for this year's Conference, and came to the conclusion that the method of procedure was the formation of a Central Board, comprising representatives from the various colonies, and

Institution of Civil Engineers, the Surveyors' Institution, the Ordnance Survey, and the Colonial Office.

The duties of this Board would be:—To peruse the examination papers set in any part of the Empire, and to call the attention of the Government of such part to any which appear to fall below the prescribed standard.

To consider appeals as to the bodies whose examinations might be regarded as exempting from the preliminary stage.

To consider any proposals for improving the working arrangements for reciprocity.

The Conference was of opinion that the position of this Board would preclude meeting frequently, but that the work of its work might be carried out by correspondence, and that meetings, say, in four years would probably suffice. Report also compares the various systems of examination at present in use, suggests the course of training and examination tests that would be generally applicable.

The surveyors may fairly claim that, the proposals of this Conference are, they will be in the forefront of the professions in respect of statutory regulation, for, with a qualification recognised throughout the British dominions they become the peers of any other profession in this respect. We do not fail to appreciate the fact that, as regards the purely scientific profession of surveyor, it is much easier to formulate a satisfactory test of competency than the case of one involving the practice of art, but at the same time the lesson is clear enough: if architects are to obtain official recognition as to their status, it is desirable that such recognition should extend to all English-speaking communities on a basis as uniform in its character as local circumstances will permit.

NOTES.

RIGHT: THE The discussions of Parliament on the Copyright Bill are not at the moment writing brought to a conclusion. It makes interesting reading because of new directions in which the inherent right principle (an artist's right of property in his work for all commercial purposes) will have to be applied—for instance, to gramophone records as well as to architectural design—and because of the great variety of points of view in which the matter may be regarded. There was considerable opposition to the right in architecture, Mr. Joynson Hicks heading the opposition mainly on the ground that it was undesirable, as it would stultify architectural development, and in support of his contention used a letter from Professor Beresford Fox, who regards the new extension to architecture as impossible, or, if possible, useless. Two or three members concentrated on the theme of the endless litigation which must ensue. Mr. Pringle was of opinion that it had never been the practice of the House to legislate on grounds of expediency, that here there was no practical reason, that no architect had suffered or feared complaint.

The Government View. MR. BURNS was hardly up to his usual standard when he said that the reference to authority did not appeal to him at all. "We had been accustomed to do things in this country as we thought proper, and he was going to follow the good old rule"—a sentiment now quite discredited. The Ministerial view, apart from the consideration that we are, in a sense, committed to inclusion of architecture by the decisions arrived at by the Berlin Convention (it is found feasible in Germany), as expressed by the Solicitor-General, is that unless the thing was too difficult to accomplish it was absurd to say that an artistic and original idea, as expressed in a building, if it could be proved, was not a thing for which the architect was entitled to just as much protection as his plans of construction and directions to the builder. Which, having regard to the opening proviso, seems sound. He added further, in order to clear away the misconceptions which sprout on every side, that "It was not always realised that copyright was not the protection of ideas. They could not protect ideas, but the original and artistic form in which the ideas were expressed. Nothing that he was urging on the House in the least prevented a style of architecture, or a mode of arrangement, or a new general view from being reproduced, as it ought to be, with the greatest ease, just as a new kind of poem or picture was constantly reproduced. It was designed to stop the rare but very gross cases of palpable, obvious plagiarism. . . ." We quote from the *Times* report.

The Profession. THE underlying theory of the matter is difficult to arrive at. The way of analogy will hardly bring us to it, because except for devices in the shape of clever plans for little houses, already sufficiently protected (they might even in some cases be patented), the work of an architect has nothing in common with that of a writer or dramatist in this connexion. A certain architect is not likely to be employed because he alone is able to reproduce a feature, when architects are expected to evolve original design and engaged for that purpose. When his work is done his whole monetary direct profit should be gained, whereas the reward of other artists depends on their work being spread and repeated—painters and sculptors, too, as far as copyright is concerned. But what is clear is that the onus of proof will rest with the architect who deems himself wronged, that it will be exceedingly difficult in the eyes of the law and a jury to prove that his work was original in its artistic essence, and further that it is of vast importance that the first few litigants should have an incontrovertible case, to secure which end, and consequent success, official action on the part of the Royal Institute of British Architects might not be improperly used. Granted success at first, and with it the foundation of prestige, legal recognition of the mere existence of individual design, apart from any right of property in it, cannot fail to augment the standing of the profession with the public at large.

Llangollen's Town Planner. WE see that the Llangollen Town Council has received applications for the post of surveyor, rate collector, water inspector, nuisance inspector, and town planning officer. While surveying the town, collecting the rates, and inspecting the water and the nuisances the town planning officer will certainly have a unique opportunity for collecting information for a town-planning scheme. Should he ever find time, in the intervals of his other activities, to prepare a plan for the improvement of Llangollen, at any rate he can rely on the cordial co-operation of the surveyor, the rate collector, and the inspector of water and of nuisances. This is so much to the good, for, as is now generally recognised, town planning is by no means a one-man job.

Presentation to M. Daumet. THE accompanying illustration shows the commemorative tablet presented to M. Daumet by past students of his atelier on the fiftieth anniversary of its foundation. M. Daumet met his old students at Saint-Germain-en-Laye.

Tablet by M. Denys Puech and M. D'Espouy presented to M. Daumet.

(From *L'Architecture*.)

and explained his work in the restoration of the Château there, after which M. Charles Girault made the presentation, and following a few remarks by M. Jausseley the master replied, giving an interesting résumé of his professional career. The intimate relationship and sympathy between master and pupil, one of the most delightful features of the atelier system, is happily illustrated by such an incident as this.

MONTREAL.

MONTREAL, the largest city and principal port of the Dominion of Canada, is situated on an island formed by two branches of the Ottawa River at its junction with the St. Lawrence. This island was first known in the XVIth century, when Jacques Cartier ascended the St. Lawrence from Quebec and discovered an Indian town at the foot of Mount Royal. Champlain, who visited the spot some seventy years later, found this town deserted as the result of intertribal warfare.

The original town of Ville-Marie de Montreal was founded by Paul de Chomedey, Sieur de Maisonneuve for "La Compagnie de Montreal," as the result of religious enthusiasm—an expedition having been fitted out in France for the purpose of founding in America a Kingdom of God upon earth. The first settlement was a fort on the north bank of the river protected by a wooden palisade.

During the early years of its existence it was engaged in a constant struggle with the neighbouring Indians, who, in 1660, overran the whole of the island outside the actual fortifications. In 1670, with a population of 1,500, the town had become the centre of the fur trade with the west, and the starting point of exploring and military expeditions. In 1721 the citadel was built and the wooden fortifications replaced by a bastioned wall and ditch. The position of this wall is now indicated by Fortification-lane, between Victoria-square and Viger-square, from which points it returned to the river-bank.

Montreal was the last town in Canada to be held by the French. It was surrendered by

them in 1760 shortly after the capture of Quebec. At the present day more than half of its population are French, who occupy the eastern part of the town, and do not mix freely with the Anglo-Saxon element. The dividing line geographically is St. Lawrence Boulevard running down to the river from the eastern side of Mount Royal.

In 1809 *The Accommodation*, the second steamship to be built in America, began to run between Montreal and Quebec, and in 1825 the Lachine Canal was opened. The construction of the Champlain and St. Lawrence Railway in 1832, the Grand Trunk Railway in 1852, the formation of the Allan Line of ocean steamships in 1856, and the final completion of the Canadian Pacific Railway in 1886, giving railway communication with the Pacific Ocean, attest the steady growth and prosperity of the city.

Montreal was at one time the seat of the Canadian Government, but, owing to riots in 1849 during which the Parliament buildings were destroyed by the mob, this privilege was taken away and the Government finally placed at Ottawa.

The population in 1800 was about 10,000, by 1850 it had risen to 37,000, and by 1890 to 216,000. It is now probably approaching 500,000, and is growing at the rate of 30,000 per year.

Being situated at the head of the Atlantic Ocean navigation, 1,000 miles inland from the Straits of Belle Isle, and at the outlet of a system of river, lake, and canal waterways extending inland to Port Arthur at the head of Lake Superior, a distance of some 1,200 miles, Montreal is a great shipping centre, and commands the traffic of the north of the continent.

Not content, however, with being a natural outlet for the produce of Western Canada, the city, by reason of its geographical position and waterway facilities, has become the chief port of exportation for the Western States of America and for the grain export business of the continent. It already does more shipping business in seven months of open navigation than is done at San Francisco or Philadelphia during the whole year, and it is now second only to New York in the monthly volume of its trade.

Apart from its shipping and carrying, however, the city is a large manufacturing centre. There are approximately a thousand factories representing a capital investment of \$100,000,000, which support a large working class population, the bulk of whom are French Canadians.

Though not quite of equal antiquity to Quebec, the present condition of Montreal is very different from that of the provincial capital. During the long period in which industrial progress of Canada was stagnant the two cities were in an equilibrium condition, but since the greater of the country has begun to open up Montreal has much more than her neighbour on the flowing tide of the country's general prosperity, and her present rapid increase in population and wealth is phenomenal. Its proximity to New York, Boston, Toronto, and Ottawa by rail makes a convenient central point of observation for the investor and the capitalist, and frequently said that there is no city of the same size in which so many millionaires reside.

The city is placed on the south-east side of the island, and extends for about five miles along the north bank of the St. Lawrence. It is built on a series of terraces sloping from the river to the foot of Mount Royal, a mass of eruptive trap rock breaking through the limestone and rising to a height of about 700 ft. above sea level, a distance of two miles from the river, and dominates the town.

The general idea of the lay-out of the city is a modification of the gridiron system, with the peculiarities of the site. In the part of the city—the original fortified position—the streets are narrow and somewhat tortuous, but in the rest of the city they have greater width and a regular lay-out. The inadequate paving, however, is responsible for a condition of dirt and mud in wet weather which, considering the size, wealth, and importance of the city, is certainly most surprising.

The business centre of the city is by the river, while the principal residential quarters are to the west adjoining the slopes of Mount Royal, the summit of which is preserved as a public park and has been laid out and improved by Mr. F. L. Olmstead.

Montreal seems to be much in need of a general plan for the lay-out of the town to remedy the worst defects of the gridiron system. This need is felt by those interested in the question, and it is probable that in the near future steps will be taken towards this end, as public interest is already beginning to be aroused and schemes are mooted for garden suburbs. Extracts from a recent report by Mr. Olmstead on the lay-out of the city were published in our last *Review of Civic Design*.

The lack of any definite city plan is to be regretted for two reasons in particular. In the first place Montreal, by reason of its comparative antiquity, its site and surroundings, and its large number of ecclesiastical and other public buildings, would, if rightly handled now, acquire an air of distinction not usually to be found in the cities of the American continent. In the second place, Canada during the last few years has grown rich and has now arrived at that stage of national growth when an era of expansion and building development may be confidently anticipated. The rebuilding of large towns to suit the altered conditions

The Canadian Bank of Commerce, Montreal. Entrance to Banking-room.
Messrs. Darling & Pearson, Architects, Toronto.

ness imperative, and in Montreal this has already begun. The buildings erected during the last few years show a decided advance over those they replace, and they possess considerable architectural merit. It is to be regretted, therefore, that this process of rebuilding should be allowed to proceed in a haphazard manner without any general preconceived scheme, the need of which is most pressing.

At the present moment, while few of the principal buildings have much architectural merit, a comprehensive scheme could be carried out at a reasonable cost and without any opposition from property owners, it is evident that the longer it is put off the more difficult it will be to avoid the erection of modern buildings of costly and inferior nature.

One of the buildings we illustrate are situated in St. James-street, between

Victoria-square and the Place d'Armes, which is the principal business street of the city. It is noticeable that, although this street is already too narrow for its present requirements—so narrow that it will only accommodate a single line of the street cars that are a feature of the principal thoroughfares of all Canadian towns—yet we find buildings of this size and architectural importance being erected without any apparent provision for the future.

Although Montreal, being the seat of the principal churches, universities, convents, and seminaries of the Dominion, has its full complement of public buildings, yet it so happens that the more recent buildings with which we are chiefly concerned—modern in style and sentiment as well as in date of erection—are mostly commercial; and among the commercial buildings the banks are the most noticeable.

The Bank of Montreal, which was already domiciled in a fine classic building with a portico of Corinthian columns 40 ft. in height, extended its premises seven years ago by building in rear what is proudly pointed to as the finest banking hall in the world, designed by Messrs. McKim, Mead, & White, of New York, and one of the most excellent examples of the severe and "grand manner" of that distinguished firm. The Canadian Bank of Commerce about a year ago opened its new office in Montreal in a building by Messrs. Darling & Pearson, of Toronto, an imposing and well-designed structure, a worthy second to that of the Bank of Montreal. The Royal Bank of Canada, the Eastern Townships Bank, the Bank of Toronto, and the Bank of Nova Scotia are amongst the banks that have recently been trying to excel one another by the splendour and solidity of their buildings.

The Eastern Townships Bank.
Messrs. Cox & Amos, Architects, Montreal.

As Canada is principally engaged in developing her natural resources and building up her commercial prosperity, the banks have a more prominent position in public life than in the case in an older civilisation, and this prominence is fitly expressed in the size and architectural importance of the buildings.

These buildings may be roughly divided into two classes—on the one hand the revenue-producing building erected as a commercial investment, such as the office of the Eastern Townships Bank, the greater part of which is let off as offices, and on the other hand the building erected solely for the use of the bank, such as the office of the Canadian Bank of Commerce.

In both cases the lay-out, disposition, and general appearance of the buildings are naturally governed by these considerations. In the first case the predominance of general office accommodation leads inevitably to the production of a building which is not distinctively characteristic of a bank—which might equally well have been erected by an insurance company or a trust corporation; in the second case the conditions give more scope for characteristic architectural expression and fine monumental design.

The head office of the Canadian Bank of Commerce being at Toronto, it is perhaps a little surprising to see what is after all only a branch office treated with this degree of magnificence, and it might perhaps be considered that the accommodation provided, with its fine suite of rooms on the first floor suitable for board meetings, is really more characteristic of a head office. Indeed, had this been the head office it is probable that, with the exception of a little more accommodation for the headquarters staff, the arrangements and general treatment would have been practically the same.

Be this as it may, the result is a fine monumental building big in scale and broad in treatment, worthily representing, in the commercial centre of the Dominion, the standing of the second largest bank in Canada, and expressing the great value and importance of banking in the present development of the general life of the country.

With regard to the plan of such buildings it may be noticed that the arrangements generally accepted here are reversed. In a building of similar character and size in England the public would probably enter direct into the banking hall, the clerks would be grouped in the centre with the public outside, and the manager placed at the back in a retired position where he would not be readily accessible to the general public.

In Canada the public space is in the centre, and the manager is at the front, easily accessible to everyone. The staff being supervised by the accountant, the manager can devote himself to his customers, and is placed where he can see everyone who comes in and all that goes on at the counters. This arrangement on an enclosed site necessitates placing the banking hall at the back, and leads to a comparatively shallow block of several stories going perhaps to the full height of the street front and screening the hall at the back, so suggesting an interesting architectural problem in the expression of this hall on the front elevation.

In other directions the buildings of the city are being renewed to suit the new conditions of the population. Rents have risen very high owing to the shortness of housing accommodation, but during the last two years much has been done to remedy this, and great suburban districts have been incorporated in the city during the last year. The towns of Outremont and Westmount, separate corporations, practically insulated within the city of Montreal, are chiefly occupied by dwellings of the middle-class.

The School Commissioners are kept busy building new schools and find it difficult to accommodate all the children. Two schools of the largest size are now being completed, and several smaller ones are in course of erection.

In a country whose natural water powers

and mineral resources entitle it to a high place amongst industrial manufacturing communities, mechanics are in demand. The system of apprenticeship is almost a thing of the past. Hence the efforts put forth to furnish schools of technical training represented in Montreal by the School for Technical Education in Sherbrooke-street, which is to be opened in September next. This has been built and equipped by the Government of the Province of Quebec at a cost of something like three-quarters of a million dollars. The Government is to supply \$20,000, and the city \$25,000 annually towards maintaining it. Within its walls are contained pattern-making shop, foundry, machine shop, forge shop, chemical and other laboratories, classrooms, and lecture theatres, besides a separate department for a school of domestic science. The architects are Messrs. Saxe & Archibald, of Montreal. Mr. Alphonse Venne being consulting architect. A view of this building is given with this number. Externally the materials used are a very pale drab brick from Pittsburg and Indiana limestone dressings.

Many new offices and store buildings have been completed within the last two or three years. At the present moment the city bristles with the steel frames of those in course of erection, and those about to arise are being loudly advertised. For these the use of dull-glazed terra-cotta of creamy tone is being introduced in a number of cases, the extension to the Lake of the Woods Milling Company's building, the Royal Bank of Canada in Outremont, the immense Jacob's building in St. Catherine-street, and others being faced externally therewith. The limitation as to height imposed by the city by-laws, which, by the way, are at present under course of revision, is that no building shall exceed ten stories or 130 ft. in height, and this limit has formed the point of arrest of many existing structures. It is even said that some of these have been prepared with substructures, calculated to carry several more stories in the anticipation of a day when this limit may be expanded. This would be a change to be deplored, as many of the Montreal streets are legacies from the bad old times when the town was crowded within a fortification wall and streets were accordingly narrow. In spite of the sparkling atmosphere which is one of the glories of the city ten-story buildings cannot but make such streets, or indeed streets of any width, unnecessarily gloomy, with a corresponding depressing effect on the poor humans cased within them.

The estimated value of the buildings for which civic permits were issued during 1910 was in the neighbourhood of fifteen million dollars, and the indications are that a greater amount of building will take place in 1911. Some of the buildings contemplated are of considerable magnitude and public importance, and we hope to be able to give particulars of some of these in future numbers.

As the eastern port of Canada, Montreal is destined to be one of the three great cities of the Dominion and one of the principal seaports of the Empire, but if she is to be worthy of this high destiny something more will be required than excellence of design in the individual buildings. Fortunately there is every reason to anticipate that her citizens, having once realised the fact that a well-arranged city facilitates business and pays from every point of view, will not be content till Montreal rivals the large American cities in charm and convenience of arrangement as she now rivals them in natural situation and material prosperity.

ST. KEW CHURCH, NEAR WADEBRIDGE, NORTH CORNWALL.

A window, consisting of four lights and tracery, has just been filled with stained glass by Messrs. Percy Bacon & Brothers, of London. The window, which is in the south sanctuary of the church, is treated in the XVth-century style, with rich diaper work on the background.

SPECIAL EXAMINATION LICENTIATES TO QUALIFY CANDIDATURE AS FELLOWS R.I.B.A.

THE question of establishing the Examination required by clause 2 of the Supplemental Charter to be passed by Licentiates, being otherwise qualified, desire to be admitted to Fellowship of the Institute has been for some time under consideration of the Council. The matter having been referred to the Board of Architectural Education, a scheme has been drawn up which received the approval of the Council, and arrangements are in progress for holding examination at an early date.

The candidate will be required to submit for the approval of the Council working drawings of one or more of his executed buildings which may be supplemented by photographs thereof, and by original sketches or measurements of drawings of actual work. Should the work submitted be, in the opinion of the Council, of sufficient merit, the candidate may be exempted from any further examination. Should the work so submitted be, in the opinion of the Council, inadequate, application will not be further entertained. If the drawings submitted are approved by the Council, the candidate will be required to submit himself to an examination, which will be held on the premises of the Royal Institute of British Architects, or elsewhere, as may be appointed by the Council of the Royal Institute.

Ten days before the examination is a list of subjects will be issued to all candidates, and from this list each candidate will be required to select one subject, and announce to the Secretary of the Royal Institute, five days before the examination, the subject he selects. When the candidate attends at the appointed place of examination, he will be furnished with particulars of the selected subject, and he will have to prepare a set of working drawings of the subject and such details as may be required, together with full descriptive notes. The candidate will also be required to write a short report on a subject previously selected by himself and approved by the Council. Ten days will be allowed for the examination of the candidate may be required, at the discretion of the Council, to attend subsequently to an oral examination on his papers. Candidates must provide their own drawing boards and instruments. The fee for the examination will be six guineas, which sum must be paid to the Secretary R.I.B.A., with the candidate's announcement of the subject which he selects. If the candidate fails to pass the examination the fee will not be returned to him, but he will be allowed to sit for subsequent examination without payment of any further fee.

Should a candidate be admitted and he will be qualified, subject to the selection of the Council, for candidature as Fellow.

Should a candidate not be passed by the Council, he will be informed of the fact the names of unsuccessful candidates will be announced or published.

THE SUMMER EXAMINATIONS

The Preliminary.

The Preliminary Examination, held for registration as Probationers R.I.B.A., held in London and the provincial examinations indicated below on June 12 and 13. Of 146 candidates admitted, claims for exam-

sitting were allowed to the number of four, and the remaining 102 candidates examined, with the following results:—

Centre.	Total Examined.	Passed.	Relegated.
London	50	36	14
Bristol	12	11	1
Leeds	8	7	1
Manchester	27	23	4
Newcastle	5	4	1
	102	81	21

passed candidates, with those exempted altogether—are as follows:—

City, Manchester	C. H. L. Kelham, Epsom
Alfred, Leigh, Lancashire	N. Kelley, Lytham
Ashtenden, Canterbury	F. H. Lambert, Lowestoft
Adlin, Sheffield	C. W. Langlands, Epsom
Aspley, Huddersfield	J. A. Lapiere, Oldham
G. Backhouse, W. S. S. Bailey, W. Baldwin, Kent	J. F. Lawson, Cirencestre
Baldwin, Sale	W. A. Ledger, Leeds
Beaverstock, Nottingham	H. A. Lister, Shrewsbury
W. Begley, High Wycombe	A. Lloyd, Swansea
B. Bell, Manchester	J. Logan, Newcastle-on-Tyne
Bonsor, London	E. C. Lomer, Southampton
Bowes, Manchester	S. H. Loweth, Hackney
Brough, Croydon	G. McBeath, Sale
Briggs, Manchester	R. N. H. MacKuller, Glasgow
E. Brinckman, Sunderland	G. M. Mackenzie, Aberdeen
Bucknole, Hants	M. Elgin Macpherson, G. A. Marshall, Canonbury
Bull, Green	A. A. Mather, Manchester
Burnett, Hastings	J. N. Meredith, North Wales
Burnett, Melton	W. A. Morris, Ramsgate
W. Burton, W. Capes, Kensington	A. L. Mortimer, Liverpool
Byrt, Bristol	D. J. Moss, Peckham
Chack, Balham	T. W. Moss, Leeds
Christie, Paisley	B. Newbould, Shipley
Clough, Sheffield	J. Norman, Halifax
Cough, Sunderland	W. R. Owens, Liverpool
McD. F. Cooke, Epsbury	W. G. Parkin, Bloomsbury
D. Cooper, St. George's	L. H. Partridge, Forest Hill
De Crouch, Rottingden	F. B. Percival, Wimbledon

June 12, 13, 15, and 16; 127 candidates were examined, with the following results:—

Centre.	Total Examined.	Passed.	Relegated.
London	85	37	48
Bristol	15	9	6
Leeds	5	3	2
Manchester	13	4	9
Newcastle	9	6	3
	127	59	68

The passed candidates, given in order of merit as placed by the Board of Examiners, are as follows:—

W. Park, London	W. L. Semple, New-castle
T. A. Page, South Shields	E. Willson, Southport
J. B. March, Somerset	A. S. Burnett, Shaw-ford Down
J. B. Matthews, Cardiff	H. M. Archibald, Paris
B. Donaldson, New-castle-on-Tyne	W. A. Banks, Staf-ford
J. A. Clarke, Man-chester	N. S. Benison, London
R. W. Ferguson, Edin-burgh	G. Bramwell, Leeds
P. D. Bennett, Bir-mingham	T. H. Broomhall, T. Barnsley
P. H. Wyatt, London	C. N. Chard, Bridge-water
T. Chalkley, Ber-mondsey	T. S. Copplestone, London
R. W. Long, Woodford	L. R. G. Errington, Exeter
H. Crone, Hove	Regent's Park
C. W. Craske, East Dereham	E. C. Francis, Haver-stock-hill
L. Y. Harris, Notting-ham	C. W. B. Godwin, Bir-mingham
C. W. Brown, Blooms-bury	J. G. Hands, Kensing-ton
A. L. Freaker, Clap-ton	E. J. Hickman, Bir-mingham
R. McLachlan, Lewis-ham	T. Jenkins, Swansea
H. A. Thomerson, Clapton	C. H. Ledger, Epsom
H. B. Fisher, Brixton	T. E. Legg, Woodford Green
J. E. Marchinton, Shef-field	S. D. Meadows, East Ham
J. H. Odum, Sheffield	H. E. Moore, Rugby
W. Holden, Bishop Auckland	S. Morley, Becken-ham
F. B. Last, Crayford	C. E. Newton, Sheffield
F. Clomes, Weston-super-Mare	R. Nandi, London
R. Phillips, Parsons Green	B. G. Norton, Leam-ington
W. H. Price, Bridge-water	W. E. Terrell, Reading
D. H. Walker, Hull	R. G. R. Topham, Greenwhich
W. Allison, Wanda-sworth	A. E. Townley, Bir-mingham
J. Weinberg, London	R. K. Young, South Kensington
M. M. Love, Derby	

The following table shows the number of failures in each subject of the Intermediate Examination:—

I. Classic Architecture	41
II. Medieval Architecture	47
III. Renaissance Architecture	66
IV. General Questions	48
V. Theoretical Construction	36
VI. Descriptive Geometry	31
VII. Applied Construction	41

Colonial Examination.

The following Candidate passed the Inter-mediate Examination held in Sydney in January last, viz:—

G. S. Keesing, Sydney, N.S.W.

Exemptions from the Intermediate Examination.

The following Probationers, possessing the qualifications required by the regulations, have been exempted from sitting for the Intermediate Examination, and have been admitted as Students R.I.B.A.:—

P. J. Adams, Buck-hurst Hill	C. A. Harding, Glas-gow
P. M. Andrews, London	H. E. Moss, Putney
G. A. Arvin, Surrey	W. R. Owens, Liver-pool
N. M. M. Blomquist, Kensington	I. M. Pritchard, Isle of Anglesey
D. M. Griffin, Birken-head	

The Final and Special.

The Final and Special Examinations, qualifying for candidature as Associate R.I.B.A., were held in London from June 29 till July 7. Of the 136 candidates examined, fifty-nine passed, and the remaining seventy-seven were relegated to their studies. The passed candidates are as follows, the 'r' prefixed to a name signifying that the candidate entered for the Special Examination, which is designed for architects in practice and chief assistants exempted by the Council from the Preliminary

and Intermediate Examinations, and from sub-mitting testimonies of study:—

M. S. R. Adams, Chis-wick	P. J. Logan, Bristol
L. M. Angus, Hamp-stead	C. W. Long, Stratham
E. E. Barks, Chelsea	W. Lucas, Hammer-smith
P. L. Baxter, London	M. R. Martin, Ealing
H. J. Benians, Goud-hurst	F. E. Mennis, Mile End
W. T. Benslyn, Cam-bridge	H. I. Merriman, Ken-sington
J. A. Bessant, Haver-stock-hill	A. H. Mottram, Hamp-stead
R. H. Bevis, Southsea	G. B. Owen, Hamp-stead
A. G. Blackford, Ealing	T. A. Parker, Lan-cashire
K. S. Broad, Putney	J. W. Paterson, Edin-burgh
B. Brown, Bradford	I. M. Pritchard, Isle of Anglesea
M. Brown, London	H. L. Samson, Streat-ham
J. E. Bullock, Black-neath	B. W. H. Scott, Clap-ham
L. H. Clarke, Harro-gate	C. Swannell, Mus-well Hill
J. C. G. Davies, Glamorgan	F. H. Swindells, Pres-ton
W. F. Davies, Chester	M. J. Tapper, London
C. Davis, Shepherd's Bush	H. Thornton, Dewa-bury
C. A. Edeson, Derby	A. G. W. Tickle, London
A. F. Evans, Prescot	H. West, East Dul-wich
J. Finning, Pinhoe	T. J. Westbye, Prim-rose Hill
T. Garbutt, Brad-ford	A. E. M. Whitehouse, Heaton Moor
B. M. Goodwin, Croy-don	N. Wiggall, Sunder-land
W. S. Gorringe, Sea-ford	L. E. Williams, Purley
G. D. G. Hake, Lam-beth	A. J. Wilson, Pejer-borough
C. A. Harding, Glas-gow	C. R. Winter, Bourne-mouth
G. W. Home, Kensing-ton	H. Wornald, Leeds
T. C. Howitt, Hucks-nall Torkard	C. Wright, London
F. W. Kessley, Redhill	A. M. Young, Wim-bledon
F. W. Knight, Chelsea	
W. Lawson, Gates-head-on-Tyne	
A. D. Leroy, Hackney	

The following table shows the number of failures in each subject of the Final Examination:—

I. Design	57
II. Principles of Architecture	54
III. Building Materials	15
IV. Principles of Hygiene	47
V. Specifications	24
VI. Construction, Foundations, etc.	48
VII. Construction, Iron, and Steel, etc.	52

Election of Licentiate.

At the Council meeting of July 20, the following candidates were elected Licentiate R.I.B.A. in accordance with the provisions of by-law 12:—

F. Abbey, Huddersfield	H. S. de Bertodano
J. S. Adam, Sydney	C. H. Bidulph-Pinchard
N.S.W.	E. F. S. Biram, St Helena
J. M. Alexander, Greenock	P. J. Black
H. W. Allardyce, Ilford	J. F. Blackwell, Ket-tering
F. J. Almond, Man-chester	H. Blagrove
W. J. Almond	W. J. Blain, Glasgow
W. H. Alton	W. W. Blair, Winnipeg
H. Ambler, Leeds	A. W. Blomfield
A. E. Anderson, Mon-treal	R. C. W. Blyth
F. W. Anderson, Bir-mingham	G. A. Boswell, Glasgow
J. Anderson, Well-ington, N.Z.	G. P. Bowie, Van-couver, B.C.
G. Anderton, Man-chester	W. C. Boyd, Glasgow
R. Angell	H. Bragg
T. G. Angell	H. C. W. Bramell, Sheffield
A. Appleby, Sheffield	A. O. Breeds
A. Appleby, Sheffield	G. W. Brennan, Oban
E. Ardley	H. G. C. Brewer
J. Armstrong, Oban	M. M. Bricknell, Gla-morgan
N.B.	T. R. Bridson
J. Arthur, Glasgow	F. Broadbent, Leeds
F. M. Arthur, Glasgow	E. W. Brook-Greaves
W. H. Ashford	A. Brown, Luton
C. J. Ashworth, Winni-peck	A. R. Brown, Man-chester
N. H. Atkins, Fareham	J. Brown, Northampton
H. E. Ayrie, Carlisle	P. E. Brown, Sheffield
E. E. Baker	F. Browne
F. E. Baker, Cardiff	D. Bruce, Glasgow
F. Ball, Nottingham	F. S. Brunton
J. E. Barker	G. R. Bryce
J. Barlow-Smith	A. F. S. Bryden, Glasgow
A. H. Barnes	R. H. Bryson
C. A. Bassett-Smith	W. H. Buck, Montreal
R. B. Batchelor, Car-diff	E. H. Bullock
R. H. Baxter, Rochdale	J. C. Bune
G. G. Beard, Kendal	C. F. Burden, Ontario
N. Beattie, Glasgow	H. S. Burdwood
W. Beatrice-Brown, Edinburgh	H. Burgess
A. F. C. Bentley	J. G. Burgess
E. Bentley, Grimsby	J. E. Burton, Norwich
R. Bentley, White-haven	E. Bush, Preston
F. F. Beaumont, Hali-fax	E. N. Butler, Alberta
	T. Butterworth, Mar-chester

ARCHITECTURAL SOCIETIES.

Royal Institute of the Architects of Ireland.

A special meeting of the Council of this Institute was held on July 26 at 31, South Merrick-street, Dublin, the President, Mr. E. Murray, R.H.A., F.R.I.B.A., in the chair.

Some correspondence was dealt with, including two letters from the Royal Institute of British Architects, which were referred to the Examination Committee and Professional Practice Committee. Mr. J. P. MacGrath, of London, was elected a member of the Institute.

Applications for permission to sit for the Fellowship Examination were under consideration.

A resolution, proposed by the President, congratulating Sir Thomas Manly Deane on having recently conferred upon him by His Majesty, was passed unanimously.

A report was read from the Arts Committee relative to portraits of the Past Presidents.

Nottingham Architectural Society: Visit to Windsor and Eton.

The Nottingham Architectural Society this week selected Windsor Castle and Eton College as the places to visit on their annual summer excursion, and a large party of members and friends joined in the outing on July 27. The Society greatly regretted, owing to family bereavement, the President, Mr. Robert Evans, was unable to join the party, which included Mr. E. R. Sutton, President; Messrs. A. Marshall, W. P. S. W. D. Pratt, W. R. Gleave, F. W. Sperry, R. S. Spencer, W. H. Taylor, S. G. Ker, and the Hon. Secretary, F. M. de la.

Mr. Nutt, the resident architect of the castle, kindly met the Society and personally pointed out the many interesting architectural details. A visit was first made to the quaint timbered horseshoe cloisters built by Edward IV., and then the party went over the curfew tower constructed by Henry III. The chapel contains a peal and clock over 300 years old, and the famous curfew bell; St. George's Chapel, a magnificent specimen of perpendicular architecture, was then fully examined.

The banners and crowns of King George, Queen Mary, and the Prince of Wales, which have been recently added to the White Chapel, were pointed out. With other helms, crests, and banners they form a beautiful and impressive specimen of heraldry. The Royal Mews, which covers an area of 4 acres of ground, are very interesting, containing the semi-State carriages and tilion landaus. The party were then conducted through the State apartments, which contain priceless pictures and magnificent specimens of arms and armour.

A visit was then paid to Eton College, which was founded in 1440 by Henry VI. It is a school for twenty-five scholars, and it is interesting to note that there are now over 100. Through the courtesy of the Provost, the Society were shown the School Chapel, which contains many beautiful memorials of distinguished Etonians; the quaint old dining-hall, with its three fireplaces, iron reading-desk; and the Library, which contains a very valuable collection of books and documents from the time of the foundation of the College.

On return to Windsor was made through the historical "playing fields of Eton," from which the best views of Windsor Castle can be obtained. Mr. Nutt then conducted the party through the Albert Memorial Chapel, dedicated by Queen Victoria into one of the most magnificent memorials ever dedicated to the illustrious dead, and in the crypt of King Edward the Peacemaker is interred. During dinner at Windsor a telegram was received from the President, and a reply sent, the thanks of those present were given Mr. Spencer, to whose exertions the successful programme of one of the most interesting summer excursions of the Society is due.

THE ROYAL ACADEMY EXHIBITION.

It is the intention of the Royal Academy to continue this winter the series of exhibitions by old masters and deceased British artists.

ARCHÆOLOGICAL SOCIETIES.

Surrey Archaeological Society.

This Society held its annual excursion on the 16th ult., when visits were made to Guildford, Woking, Shere, and Albury. The party drove to Great Tangle Manor House, where the members and friends, numbering about two hundred persons, were received by Colonel E. H. Kennard, F.R.G.S., who said that this estate was formerly the hunting ground of the Norman and Saxon kings and had only changed hands by sale three times since the Norman period. Edward the Confessor's daughter married Earl Godwin's son, who was first lord of Tangle at that time, and he lived at the same house. In 1575 it passed into the hands of the then Duke of Norfolk. Afterwards it came into the possession of the Grantley family, Sir Fletcher Norton, afterwards Lord Grantley, buying it while Speaker of the House of Commons. The Grantley family sold the house to Mr. Wickham Flower, and after his death he (Colonel Kennard) bought it. The party next proceeded to Woking, where the church and its restoration were described by the Rev. A. L. Brown, Vicar, from notes supplied by Sir Charles Nicholson, Bart., F.R.I.B.A. The great interest of this building is its state of preservation. The church escaped the risks of repair in the XIXth century. The north wall and part of the chapel were Norman. In 1793 the church was in a ruinous condition, and was then completely transformed at a cost of 600l. The work was well done, and remained in a good state of repair for a century. The church registers dated back to 1533, and were nearly complete.

Mr. Philip Johnston referred to the underground chamber. This was commonly called a crypt, but he had reasons for believing it was an old charnel house, which had been very much curtailed in the alterations which had taken place from time to time. Mr. Ralph Nevill called attention to the old-world cottages at Woking and Shamley Green.

At Farley Heath, Mr. H. E. Malden, M.A., made some remarks on the important Roman remains, ranging from flint arrowheads, scrapers, knives, and tools, to bronze objects, and a cake of copper for making bronzes, and certain bronze brooches and ornaments which had been found. The bronzes are now in the British Museum.

At Shere, Mr. P. M. Johnston said the place had always been a place of importance, and none could beat it in Surrey for those qualities which seem to make up the ideal village. For that and other reasons Shere was a haunt of painters. The church was mentioned in Domesday Book survey, and was second to none in Surrey in antiquarian interest. Some of the materials of which the church was built were possibly derived from Roman buildings on Farley Heath. They saw in this case an exception to the unhappy mistakes of our early church repairers of paring the walls inside and out. What mischief had been done was mostly traceable to the church warden period or even earlier. The plan offered many interesting problems, several of which he proceeded to explain. The font was one of the most beautiful in Surrey and in England. The church is very rich in monumental tombs.

Albury Park and Church were also inspected by kind permission of the Duke of Northumberland, K.G. Mr. P. M. Johnston here described the old church of St. Peter and St. Paul, which he said had been out of use for a great many years. The old disused building was kept up after a fashion, but within the last twenty or thirty years the chancel had become roofless. The most interesting parts of the building were roofed in, and the walls were intact. The tower had a most picturesque dome of melon or pumpkin shape, which was very unusual. The doorway was a foot long.

ALL INDIA MEMORIAL TO KING EDWARD, DELHI.

Sir Thomas Brock, R.A., is commissioned as the sculptor of the colossal bronze equestrian statue of Edward VII., which will be erected upon a red sandstone pedestal between the Jama Masjid and Alexandra Gate, Delhi Fort.

THE ROYAL SANITARY INSTITUTE CONGRESS, BELFAST.*
ENGINEERING AND ARCHITECTURE.

The sittings of the Section of Engineering and Architecture opened on July 26 under the presidency of Mr. W. Kaye Parry, M.Inst.C.E., F.R.I.B.A.

The Chairman, in opening the proceedings, said they must all realize that a great change had taken place in Ireland during the last quarter of a century, and it was a subject of congratulation that, although in the matter of public health administration they were not what they ought to be, and they were not what they hoped to be, yet they could thankfully add that they were not what they were. Having regard to the fact that the population of the country was decreasing, the increased expenditure on engineering work in the interests of public health furnished remarkable evidence of the activity of the sanitary authorities under the Local Government Act.

Town Planning of a Modern City.

Mr. Charles Brownridge, M.Inst.C.E. (Borough Engineer and Surveyor, Birkenhead), in a paper on "Town Planning of a Modern City from an Engineer's Point of View," said many people advocated the taking of workpeople to live further out in the country. If factories and workshops were placed in the suburbs this would be a feasible suggestion, but the ordinary industrial worker desired to live within reasonable distance of his work, and he considered that this was an arrangement which should be fostered rather than deprecated, as it enabled the breadwinner to go home for meals. Where the manufacturer, as at Port Sunlight, Burnesville, Earswick, etc., took his factory or works some short distance out of town, and in conjunction with the manufactory or works dealt with the housing of his workpeople, an ideal condition was achieved; but, as existing conditions would, in most instances, for many important and evident reasons, have to be accepted, it must be their duty, while doing what was possible to ameliorate and reduce any disadvantages arising from such conditions, to so plan and extend their towns as to obtain from the powers available every advantage from a health, housing, and sanitary point of view, and it was the various points necessary to attain this result that those having to deal with the question of town extension and town planning would have to concentrate their serious attention and energy. The author proceeded to deal with the conditions obtaining at Birkenhead and Cloughton, which, he said, offered an excellent illustration of town planning. In 1833 Birkenhead, which then had a population of 3,000, was placed under the control of Commissioners with powers for providing such arrangements as usually belong to rapidly-developing districts. A scheme for the laying-out or planning of the area in question in a most complete manner was decided upon and adopted, based chiefly upon the block or rectangular system, which at that time was considered the most desirable and up-to-date method of town planning. A considerable mileage of roads was at once laid out and formed, and the remainder laid out and formed as the town increased in population. With regard to the extent of a district for which a town plan should be prepared, various suggestions had been made to the effect that probable development for twenty to thirty years should be provided for, but naturally this would greatly depend on local conditions. Whatever the extent decided upon, the scheme should be so designed and arranged as to form part of a scheme of practically illimitable extent, in order that if a further belt of land had at a later date to be planned, this additional area would work in and adapt itself to the portion already executed. Some authorities advocated the preparation of a plan for the complete laying-out or development of an area, including not only the main and secondary roads, but the detailed planning of all the land included in the scheme; whilst others (and he himself) preferred that the scheme should provide for the laying-out or planning of the main lines of communication, both direct and transverse, leaving the detailed filling in or development of the land between to be carried out by private enterprise. This

* Continued from last week (see p. 98).

latter method would be the one most generally adopted, as it would not appear fair to bind the landowner (possibly some considerable time before he was prepared to develop his estate for building purposes) to a specific detailed scheme. This arrangement would also leave some scope for the initiative of the architect and surveyor to whose domain this work properly belonged, and possibly prevent a monotony of type in estate planning. The local authority should, however, take powers to have full and effective control to ensure that the arrangements suitably conformed to the general scheme, and that the means of intercommunication were satisfactory and ample. It was not possible to make all districts, as the physical condition and the configuration of the land, together with local conditions and, possibly, drainage considerations would materially influence the general planning of a district; and different areas within the same district might require different treatment. In preparing the scheme it would be advisable to be ambitious and look well ahead, keeping in mind the fact that "construction" was more satisfactory and cheaper in the end than "reconstruction," and in preparing any scheme good, sound common sense, associated with all the assistance that practical knowledge and science would supply, should be exercised. The scheme should be clothed with all the lines of beauty and ornament that artist or nature could suggest, and all the advice and assistance possible should be obtained from those capable of rendering it, in order that the scheme, when completed, might be the best that could be devised, both from a practical and artistic standpoint; and it should take into account all means of transportation, both by land and water, utilisation of water frontages, etc., and the allocation of land for recreation-grounds, playgrounds, parks, sites for schools, baths, allotments, etc. Play-grounds for children should be fairly frequent and convenient to the areas to be served, but there does not appear to be any great objection to recreation-grounds or playing-fields for seniors being some moderate and reasonable distance away. In considering both the improvement of existing and the planning of new areas adequate means of access to railway-stations should be provided. There was much to be said in favour of the Continental argument that the railway-stations, being the principal approach to a town, should be suitably designed and placed. Railway companies might also be urged to pay some little attention to beautifying their stations and approaches in industrial areas similar to that frequently adopted with success at a number of suburban stations. The desirability of providing additional station facilities for suburban traffic must be borne in mind, and if distributing centres for goods were opened in conjunction with certain of these suburban stations it would materially reduce traffic congestion in the central area. For the purpose of preserving records for future reference photographs should be taken of old houses, old lanes, or characteristic features which will be transformed or altered by the scheme.

Dealing with the question of roads, the author said that the improving and extending of the existing main roads, and the provision of ample cross-communication roads would require careful consideration. He thought it would also be advisable on public grounds if building by-laws could be simplified and revised so as to operate more stringently against the jerry builder, and give some little advantage to the conscientious and sound builder.

Mr. J. Munce, M.Inst.C.E. (Belfast), contributed a paper on "How a Town has Succeeded Without the Town Planning Act." He exhibited a number of lantern slides showing plans of Belfast about 150 years ago, when the population was under 8,000, and of the city at various dates since, which enabled these present to see the great improvements gradually carried out under powers contained in different local Acts. The Corporation had power to fix frontage lines of new buildings 35 ft. back in all streets less than 70 ft. wide. If this power were put in force the distance between the buildings in new streets of minimum width would be 100 ft., but this was not carried out as a rule, for every case was carefully considered on its merits. The author showed how, owing to a definite

plan formulated many years ago, the Corporation had been enabled to widen streets at a very small cost.

Mr. E. Welch thought that in Belfast they suffered from the fact that the town was laid out on Scotch rather than English lines. In some of the towns in England they would see a liberal provision for gardens, but in Irish towns which were Scotch settlements they found the houses extremely mean, for there was not a house in Belfast up till quite recent years which was built on the generous lines of the ordinary residential houses they would, for instance, see at Tralee. In many of the little towns of Ireland, and particularly in County Cork, there were most delightful houses on the English system, but in Belfast there was only a little bit of the centre of the town planned in that way. They could brag in Belfast of single houses, but they had nothing else. They had long streets and nowhere for the children to play except the open street. It was exactly the same idea which led to the building of labourer's cottages on the very edge of the road, instead of placing them back. The result was that in these days the children got all the filth of the roads. The Scotch idea was, of course, the small house—thrifty and economic, of course, but with no idea of what they might call the refinements of life. The Englishman, however, did have some idea of the refinements of life, and he tried to get a garden, and he was very sorry that this English influence, which they saw in the eastern and south-eastern counties or Ireland, did not get to Belfast.

Mr. Luke M. Hill (George Town, British Guiana) said he had been the engineer of the town for thirty-two years, during which the population had increased by 50 per cent., and he had laid out four new districts containing twenty miles of streets. Their streets were all laid out rectangular, which, although rather monotonous, was a convenient way. None of the streets laid out under his supervision were less than 60 ft. wide, and many were 100 ft. wide. They had difficulties in the fact that their average level was 4½ ft. below sea level, and they had to make large provision for storage of rainfall by canals and reservoirs, which discharged into the river by sluices. These canals were laid down either the centre or the side of the roadway, and the widths of the streets he had mentioned were exclusive of these canals. The reservoirs not used for drainage purposes were planted with aquatic plants, which added much to the beauty of the town, and had caused it to be named the Garden City of the West Indies. Unfortunately, they had recently received a visit from Sir Rupert Boyce, who had condemned this street planting as harbouring mosquitoes. He had had rather a hard fight to save the trees, which he had been planting for thirty years.

Mr. S. Brodie (Blackpool) said that when he was in Liverpool many years ago they used to be filled with despair when they considered the beautiful laying-out of Birkenhead. In many respects, however, Birkenhead was in ideal town, and Mr. Brownridge had brought before them a counsel of perfection. Mr. Munce had told them how Belfast had succeeded without Town Planning Acts, but, as a matter of fact, every local Act which Belfast had obtained was a Town Planning Act.

Mr. W. Whitaker said he would like to say something as to the fetish of broad roads and straight roads, and give an example of a town in the kingdom which owed a great deal of its beauty to not having all its roads straight and not having all of them broad. The town he meant was London. He ventured to say that some of the beauties of London would be spoilt if too much street widening and straightening was done there. Was there any street in the world so well known for good shops as Bond-street? But that road was not 50 ft. wide. Why was that? One reason was that it was a great deal easier to cross a road 50 ft. wide than one of 100 ft. He was a man who liked to see both sides of a question, and liked also to see the shops both sides of a street. He allowed that some parts of Bond-street did want widening, but he hoped it would not be extended far. Of course, for main lines of communication they wanted broad streets, but he did not think it was necessary that every street should be at least 50 ft. wide.

A city might, in that way, be made frightfully monotonous and confoundingly ugly. He was happy to say that, in Croydon, owing to the blessed intervention of the Local Government Board, they had succeeded in defeating a street widening which would have destroyed one of the few old quaint buildings in the town. They had gloriously defeated the Corporation, and they blessed the President of the Local Government Board for helping them.

Mr. Brownridge, in reply, said that engineers would agree with all Mr. White had said. The engineers did not want to destroy any of their historical or picturesque spots, and he had emphasised the point in his paper. They must utilise all the art features there were in their districts. The case of Bond-street could be illustrated almost every city. In Liverpool they had broad streets, whilst in Dublin the best shopping street was a narrow one. He thought they must accept it as an actual fact that narrow street was the best for shopping, and that was why he had drawn attention to the necessity for having shopping centres. Mr. Munce said they had not gone in for very straight roads in Belfast, and if they rode on the tramcars it would be not how they twisted round buildings. He particularly wanted to see was the horse back from the roadway. They did not particularly want the space in the roadway because it greatly increased the cost of scavenging.

The Laying and Testing of Earthenware Sewers and Drains.

A very practical paper was read by Mr. Sayers (Belfast) on "The Laying and Testing of Earthenware Sewers and Drains," which led to a considerable discussion. The author drew particular attention to the urgent need there is for standardising of pipe laying for inspection. Regarding pipe laying it he said it was surprising that even at present day much of this class of work done by casual labour. Did it not seem less writing books or lecturing about laying and sewer construction if the details of the actual works was left in the hands of every Tom, Dick, and Harry. He suggested that it was of the first importance that the pipe-layer should be an experienced and competent workman, possessed of not only practical skill, but also of such a measure of theoretical and technical knowledge as would enable him to interpret instructions and overcome the many difficulties that were encountered in everyday practice. The pipe-layer should be a properly qualified and skilful workman of the first class, belonging to a particular recognised body of tradesmen, all others should be prohibited from laying new or altering or interfering with existing sewers or drains.

Mr. A. J. Martin asked whether the author would join with neat cement or with concrete and sand. He always insisted that the wet test should be applied before a trench was filled in, and that the test should continue until the trench was filled in.

Mr. P. C. Cowan thought the use of the phrase "earthenware" was far too indefinite for there was widespread confusion between the various pipes used by the engineer. Scotland and the north of Ireland fire pipes were commonly used, and they were good deal cheaper than stoneware. Engineers, however, were prejudiced against their use. A friend of his at Glasgow would not use either, but said that iron pipes in long run cost very little more.

Mr. Cotterill (Bristol) touched on the importance of greater care in the laying of pipes, and on the attention required after they were laid and suggested that some certificate of efficiency in pipe laying might be issued either by the Institute or by an engineering body.

Mr. J. Sloan (Cork), as the result of twenty-eight years' experience, considered that clay pipes were unsuitable for house drains.

Mr. Sayer, in reply, said he hoped the question would call attention to what was very important matter in regard to the laying of the community.

Municipal Hospitals.

Dr. P. Boobyer (Medical Officer of Health, Nottingham), in the course of a paper on "Municipal Hospitals," pointed out the

of the trend of legislation local authorities would be called upon in the future to provide greatly increased hospital accommodation, and, basing his conclusions on experience for the last fifteen years at Nottingham for successful treatment in the open air for infectious diseases, he suggested that the extension of isolation hospitals and sanatoria in the future could advantageously take the form of inexpensive open-air pavilions.

Foundations.

An interesting discussion arose in the Architectural and Engineering Section of the Royal Society on a paper dealing with the geology of Belfast and neighbourhood, read by Mr. S. Munce, A.M.Inst.C.E. The author pointed out that Belfast was almost entirely built on alluvial deposit, consisting of a material which looked like a blue clay. On being exposed to the air it was of an extremely solid appearance, but on being wet it became a semi-fluid, oily material, which would find its way back to the trench from which it may have been brought in, if left near the edge. The usual method of supporting large buildings was by the foundations, the method of carrying down concrete pillars or other similar construction to the underlying solid stratum being much too costly owing to the depth to which the latter was usually found. As a rule the piles were of larch. Over the top the piles were fixed whole timbers, and between and over these was placed concrete, which in effect the buildings were carried on.

Mr. W. Whitaker pointed out that Belfast was not the only city built on "squash," for great deal of Westminster was also built on it. When engineers and architects were consulted by the geologists that they had to build on "squash" they were quite capable of doing so. In the case of the Government buildings in Parliament-street, Westminster, they went down to solid ground for the foundations, and the distance they had to go down varied from 10 ft. to as much as

Mr. Brodie (Blackpool) remarked that in the district they called such material "slob," and reinforced concrete piles of 60 ft. in length, which were less expensive and more spring than timber.

Mr. E. T. Hall, who referred to the alluvial deposit as "sludge," described a building he erected in the Thames-embankment, where no solid foundation could be found at less than 42 ft. He laid a raft of reinforced concrete on the sludge, and built on it successfully.

Mr. Whyatt (Borough Engineer, Grimsby) pointed out that in his town they called such deposit "slop," and they had found it absolutely necessary to use piles. In the case of a building built there a steel and concrete raft was used, but the building tipped before the piles were down, and the whole thing had to be pulled down and reconstructed on piles.

Mr. C. W. Ferguson (Belfast) said he had built on the "squash," which was also known as "slop." After negotiations with the adjoining owner a party wall was decided on, built on piles which were 30 ft. long, but the adjoining owner built on concrete, with the result that his building was dragged down. He maintained that the principle of building was right.

Influence of Building Regulations on Architecture.

Mr. H. D. Searles-Wood, F.R.I.B.A., in a paper on this subject, said the earliest building regulations were found in the laws of Khammurabi. They were over 4,000 years old, and were as follows:—
viii. If a builder build a house for a man to complete it, he shall pay two shekels of silver for each sar of surface. cccxix. If a man build a house for a man and has not laid his work strong, and the house has fallen and killed the owner of the house, that builder shall be put to death.
ix. If it kill the son of the owner of the house, the son of that builder they shall kill.
xi. If it kill the slave of the owner of the house, a slave equivalent to that slave the owner of the house he shall give.
xii. If the property of the owner of the house it destroys, whatsoever it destroys he shall make good, and as regards the house he shall build it, and it fell, with his own property he

shall rebuild the ruined house. cccxxiii. If he build a house for a man and did not set his work strong, and the walls topple over, that builder from his own money shall make that wall strong.

These Babylonian laws were based on the *jus talionis* principle. A life for a life, an eye for an eye, a tooth for a tooth was the natural law of life, and it was found in all communities.

He thought, therefore, he was justified in saying that the first designer of the pyramids had these laws in his mind, and he was not going to take any chances. Under this code the builder's family were very directly interested in the stability of the work, and it must have required an heroic effort to introduce a new feature that had the slightest appearance of disturbing the repose of the structure. Buttresses were popular, as might be supposed, and recessed panels. These early people used hollow walls to keep the rooms in their dwelling-houses dry and cool, built staircases, and, although it was not quite germane to the subject, it was interesting to note that the bricks they used were made to a standard size, ranging from 8½ in. by 5½ in. by 2½ in. to 9½ by 4½ by 3 in.

When they were working out the Royal Institute of British Architects standard size for bricks, these were considered, and their standard size, 8½ in. by 4½ in. by 2½ in. to 9 in. by 4½ in. by 2½ in. was very nearly the same. What this really meant was that the handiest size for a Babylonian bricklayer to handle all day long was the same as the British bricklayer found the easiest to handle to-day.

The XII. tables of Roman law contained several building regulations, and as they were drawn up by a commission that collected statute laws from Greece and other foreign countries, they might be taken as the standard for the period. Only fragments of them were known, and they chiefly related to easements such as you were not allowed to have, dripping eaves, etc., and they did not appear to have made much mark on Roman architecture. In mediæval England the domestic houses were built on traditional lines, but how far these traditions were regulated by by-laws he could not say.

The overhang, which was a common feature, and which was first used in town houses to protect the goods exposed on stall boards, and afterwards copied in the country, where there was no likelihood of the houses having stall boards; this overhang was regulated by by-laws, so that the projection should not interfere with people riding through the streets on horseback. In modern building regulations three things were considered:—(1) The prevention of the spread of fire; (2) the construction of the building to guard the safety of the public; and (3) public health. It was the regulations that dealt with the prevention of the spread of fire that had had the greatest influence on the architecture of the period.

The regulations based after the Great Fire of London set the fashion for brick and stone-fronted buildings, which altered the appearance of all the towns in the kingdom, and in more recent times the Metropolitan Building Act, which was the first set of building regulations that seriously dealt with the problem of the prevention of the spread of fire, made marked changes in the architecture of the XIXth century. The 4½-in. reveal to all windows and doors, and the restrictions as to barge boards and wooden cornices, and the parapets to the party walls were the marks of this set of regulations.

The rules laid down in the Metropolitan Building Act of 1854 for dealing with the rights of the building and adjoining owner of a party wall had worked so well that it was surprising no other city or town had adopted the same system. There was a tendency nowadays to complain that the model by-laws were too severe, and that they prevented the building of cheap cottages and elementary schools. At the first exhibition of cheap cottages at Letchworth the cottage that won the first prize was in accordance with the model by-laws in every particular. In going round the numerous garden city developments the only two things in the by-laws that appeared to increase the cost were the height of the bedroom stories, where 9 ft. was insisted on, and the height of the studded walls, which was also regulated by this by-law. In places where the story was 8 ft., the

available area was also increased, and there did not appear to be any serious sanitary point in requiring 9-ft. stories. The Building Acts and model by-laws were all based on brick construction, and the introduction of skeleton steel construction and reinforced concrete necessitates some changes in these Acts and by-laws. The Royal Institute of British Architects had just issued a second edition of the regulations for reinforced concrete construction, which were the standard for such method of building in the British Empire. This revised edition would be the basis of the regulations about to be issued by the London County Council, and would be dealt with very much on the lines of their regulations for skeleton steel construction, which were in their Act of 1909. The principle was that the calculations on which the steel construction had been designed were submitted, with the drawings, to the district surveyor, who checked the calculations before the plans were approved. These calculations could be made in any form that was recognised by the profession; but a good method of tabulating the calculations had been drawn up by the District Surveyors' Association and approved by the Royal Institute of British Architects, and it was a great saving of time and labour if the information was given by the architect to the district surveyor in this form. The regulations for reinforced concrete gave the tests to be applied in selecting the materials and the methods of calculating the various parts of the building, the method of mixing the materials, and the precautions that had to be taken in preparing the centring and carrying out of the work. Some people were of the opinion that the time had come when there should be a general Building Act for the whole country; let them hope, if this came to pass, that it might be so drawn as not to stereotype existing methods of construction, but stimulate new and better methods than at present. It might be a good thing to encourage architects to work out the strains and stresses in their structures by making a law that the methods of calculating the designs should be submitted to the district surveyor, and if found correct the construction should be allowed, and thus do away with all those cast-iron schedules and rules that so often hampered an original design. It might be said that these were matters which did not directly influence architecture, but with the introduction of new materials and methods of construction, new means of expression must be found. It was true that over 4,000 years ago men were using the same materials as were now commonly in use, but during that time what varied expression had been given to the use of these materials. Each succeeding race had written its history in monumental works that were our most cherished possessions, and they in their time must strive to leave behind them some monuments worthy of the age in which they lived.

Mr. John Slater said, as architects, they might congratulate themselves that the stringent laws which existed in Khammurabi's time did not now exist, or he was afraid the profession would not have many people come into it. Mr. Searles-Wood had referred to mediæval regulations and talked about the construction of overhanging eaves, but there was one very curious fact he had not alluded to. In a great many places they were required to have overhanging eaves at the side of the building, and the same thing applied to the building next door. The old regulations required that a certain space should be left between the side wall of one house and the side wall of another, and the consequence was that instead of a party wall they had a party open space, and this had remained in some cases up to now. The expression used for the space between the building was "twichel."

Mr. Brodie (Borough Engineer, Blackpool) said he would welcome anything which would simplify the laborious duty of specifying by-laws, for it often happened that in the most carefully-drawn-up building by-law points which arose were not covered. It would be a great mistake for any new Building Act to come up for the whole of Great Britain and Ireland which laid down minutely what ought to be done. All they could attempt was general principles covering the safety of a structure, and also the health of the people who had to occupy the building, whether it

be a dwelling-house, or a large meeting place, or a warehouse.

Mr. E. T. Hall said that the subject brought up by the author was one of very great importance. He thought if they were going to lay down cast-iron rules they would prevent experiments in new forms of building, and by stereotyping rules and regulations they would render it very difficult for the architect who had got some new method of expressing himself to give effect to that. The gravest objection he had ever heard to the present system was that if they left it to the discretion of those who were carrying out the Act they were leaving it to an unknown quantity. The great majority of the men who had the final carrying out of the Act were men of great common sense and great experience, but it was within the knowledge of everybody that occasionally they came across men who had not the training and who were not gifted with common sense, and these men were obstructive and troublesome. It was because of such men that many persons had sought refuge in having strict regulations laid down. He had had experience of one or two such men, and must confess that it was a great trial to the flesh. But, on the whole, he must say that 99 per cent. of the surveyors to local authorities who administered the laws were considerate and sensible in dealing with them. He felt with the author that it would be a great blessing if they could get rid of the costly litigation and obstruction and confusion which arose from light and air cases. In Scotland they had the Dean of Guild Court before whom such matters were settled. The Royal Institute of British Architects drew up a Bill to get rid of "light and air," but when the decision was given in the *Cells* case in the House of Lords it was felt that no new law was necessary, as the judgment was founded on what they considered to be magnificent common sense. Unfortunately, however, since then some of the judges had interpreted the law in a different way, and things were almost as bad in some courts as if the House of Lords' decision had never been given. He confessed that he considered it iniquitous that a man should acquire rights of light over his neighbour simply because the neighbour—often for the amenity of a district—had chosen to keep his land vacant. He understood Mr. Searles-Wood to say there was no building law until after the Great Fire, but unless his memory served him false William the Conqueror laid down some laws. As regarded air and light matters, they might be dealt with in the same way as party-wall questions.

Mr. Cutler (City Surveyor, Belfast) said that he recognised the advent of ferro-concrete building was enormously increasing the surveyor's labour. It was not possible for the ordinary staff employed in the inspection and supervision of buildings to have the necessary knowledge to make the calculations which must be gone through to see that any design was safe. He knew that such buildings had come to stay, and if there were many buildings of ferro-concrete put up in Belfast he would have to have an addition to his staff to deal with the scientific problems which arose. With regard to the building by-laws in general, he considered the more cast-iron they were the better, and he did not believe there were many by-laws for ordinary buildings which interfered with architectural practice. They must not forget that the bulk of the buildings in any town or city were not put up for architectural beauty, although he admitted they might well be. Building by-laws were absolutely necessary for the control of those who were not accustomed to architectural problems as were those present. He could quite understand the architect's point of view, but when they had to deal with the jerry builder, and with the many men who did not even employ a builder, but put up buildings under their own supervision, then the more cast-iron the rules were the better. Occasionally they might operate rather harshly in cases where a fully-qualified architect was concerned, but, on the other hand, they operated very beneficially in dealing with the class of men he had referred to. Another point was this. A surveyor might disapprove of a plan, and the person concerned might try and get behind the surveyor's back and go to the Committee. If the rules were strictly laid down the

Committee could do nothing. In Belfast, although they had no by-laws for regulating steel and ferro-concrete buildings, yet they had used such discretion as was necessary in dealing with these structures. They had not enforced the by-laws with regard to the thickness of walls, and they had given facilities to those who wished to use such materials, and the Committee had met every case in a reasonable way.

Mr. Lacey (Oswestry) said there was nothing in the building by-laws which had any bad effect on architectural features. He did not think the by-laws for brick and stone buildings were too severe, for they only took the minimum so far as the safety of the building was concerned. Certainly, they were below what the minimum ought to be with regard to air space and sundry other matters which would affect the health of those who had to live in the buildings. At the same time he agreed that statutory powers should be given to local authorities, which they had not at present, to allow for steel construction and ferro-concrete buildings.

Mr. W. H. Wyhatt (Grimsby) remarked that, whatever they put in by-laws, there were some builders who would try to get below them, and he quite agreed with the views of Mr. Cutler. London differed from the provinces in building, especially with regard to the quality of the bricks used, and the code as to the thickness of brick walls was probably correct for London. The model by-laws were, however, too severe for the provinces, and they felt that they could build a 9-in. brick wall 8 ft. or 9 ft. higher than could be safely done in London. In London most of the houses were three or four stories, and it was necessary to carry the party wall through the roof as a protection from fire. In the provinces the houses were two or three stories, and it was quite unnecessary that there should be the great cost of carrying the party wall through the roof. The Local Government Board had been getting out a new code of by-laws for five or six years, but had not made up their minds when they were going to promulgate them. Personally, he felt it was a great mistake to give the officials any discretion at all with regard to the enforcement of by-laws. A builder would come and plead a special case, and the surveyor might feel inclined to give way on a point, but they knew perfectly well the builder would tell somebody else, and then others would come and want a relaxation of some other rule. Therefore, he felt that the by-laws should be as definite as possible.

Sir Henry Tanner said that he was practically free in all his building construction from by-laws, but he would rather go for latitude as far as possible in all by-laws, and allow plenty of elasticity. As to reinforced concrete, he did not think they could make any rules which would cover everything, and thus, as far as possible, that should be left an open matter. He would not like to concern himself trying to fill in the form which the author had handed round, and he thought there would be a great many mistakes made in trying to fill it up. Still, they did not seem to have mistakes in construction for the buildings stood right enough. On the whole he preferred that each case should be dealt with as it arose. Even if they took the rules which the author had handed round, they only applied to particular points as to corridors and columns, and so on, but no mention was made of any sort of connexion between the several things, and yet it was one of the most essential things in reinforced-concrete construction.

Mr. P. C. Cowan (Irish Local Government Board) said on his shoulders lay the duty of revising the general building by-laws of Ireland, which followed the English code very closely. Mr. Searles-Wood did not tell them what grievance the architect had, or what effect the by-laws had on architecture. He ventured to submit that the building by-laws of Ireland could have no prejudicial effect on any reputable architect's practice, and he was absolutely certain from experience that any relaxation with regard to common ordinary buildings would be a great and gross mistake. He agreed that it was not possible to put into short, crisp by-laws regulations for reinforced-concrete buildings, and that the submission of the full plans with full calculations for revision and approval by the local authority was the proper line to take. Except in one or two large towns,

there was no power for a local authority in Ireland to waive its by-laws; but he was sorry to say some authorities did so, although it was unlawful. They might take it that practically every case where this was done was a deterrent to the public.

Mr. J. Munce (Belfast) said he never knew what jerry building was until he went to London. In Belfast they would see actual houses, so far as construction was concerned, as anywhere. Sir H. Tanner represented the Government, and had unlimited money at his disposal. [Sir H. Tanner: "You are very there."] And he was not asked to build a house for 3000. on which if he had his way he would spend 6000. or 7000. In fact they had gone on the principle of building houses for people to live in, and not look at. People spent a large part of their lives in their houses, and they tried to make them comfortable. In Belfast they went to Parliament for powers to deal with concrete buildings, and hoped to get them passed in a few days.

Mr. Searles-Wood said he would attempt to answer the points raised, but had been successful in disguising his feelings in regard to by-laws. As a district surveyor for twenty-eight years was quite in favour of by-laws, and he never found any difficulty in meeting with reasonable requirements of by-laws.

Our report will be continued next week.

THE ROYAL ARCHAEOLOGICAL INSTITUTE IN SOUTH WALES

In deference to the wishes of many members of the Council of the Royal Archaeological Institute to hold its annual meeting this year in South Wales. And in order as far as possible to do justice to so interesting a district in the short time available the earlier part of the meeting has Cardiff for its centre, while the latter days are to be worked from Llandudno. Under the unfortunate circumstances of the death of a member of the Council, who was assembled at the City Hall at noon on Tuesday July 25, when Alderman Bevan, in the unavoidable absence of the Lord Mayor, formally received the party and welcomed them to Cardiff. Sir Edward Bouverie returned thanks on behalf of the Institute to the kindness of the authorities the Corporation and pieces of plate (all recent gifts) exhibited, as well as an interesting series of charters, with good heraldic seals, granted to the town by former Lords of Glamorgan and other Royal confirmations. After luncheon the reassembly (by permission of the Marquis of Bute) at Cardiff Castle, the history of which was described by Mr. J. S. Corbett and John Ward. The site, which is a square plan, was at first a Roman fort, defended originally by earthworks, but later by a stone wall, to which towers were afterwards added. By the Normans the area was converted into a castle, by the throwing up of a mound for a great tower in one corner and burying the ruined remains of the Roman wall and under a high bank of earth and gravel obtained by the deepening of the surrounding ditch. These works, which were, no doubt, strengthened by wooden defences, are usually ascribed to Robert Fitzwarren, Earl of Gloucester, in 1093. The mound was subsequently covered with a polygonal great tower in mass the banks crested by walls, and the area divided into an outer and an inner bailey with an intervening gatehouse. The hall and its adjuncts were built against the west wall and are now represented by the Marquis of Bute's residence. The restoration and decoration of this were executed by the late Mr. J. W. William Burgess, and no more noble example exists of the extraordinary genius and versatility of that gifted artist. Every day was afforded the party for inspecting Cardiff Castle, and the Roman remains now in position of "restoration" were pointed out by Mr. Ward. A visit was also paid to the remains of the adjoining Black Friars monastery. A move was next made to St. John's Church, which was described by Dr. C. T. Venn. Its most noteworthy feature is its west tower, which is of the Somerset type, and dates from 1473. Under the guidance of Mr. J. W. William Burgess, and the other members of the Grey Friars monastery, excavated in 1897, were also examined. At the evening meeting in the City Hall an address was

been delivered by the Earl of Plymouth, president of the meeting. Owing, however, to a political crisis the Earl was detained in London, and at very short notice his place was taken by Mr. J. W. Willis Bond, F.S.A., who read an interesting paper on the historical and geological differences between the counties of Devon and Cornwall.

On the morning of Wednesday, July 26, the party departed on an excursion to Caerphilly, which involved a short railway journey to Cardiff. On arrival at the Castle Mr. F. St. John Hope took charge of the party, and from the platform that formed the outer wall, just within the great gatehouse, pointed out the main features that differentiated this fortress from every other in South Wales. Apart from its exceptionally large size, it is said to include with the outer works an area of 30 acres, the Castle is peculiar in having been originally surrounded, like Berkhamsted, by a large and deep artificial lake, formed by raising up the waters of two small streams by a long stretch of walling, strengthened by small buttresses or towers, and backed by high earthen platforms. This forms all the eastern side of the outer defences, and has the great advantage in the middle and a broad wet ditch formed by the barbacan and bridge over the arms of the lake. At the northern end is a minor gatehouse, and at the south end a series of towers and bastions to defend the vulnerable sluice-gates of the lake. On a square island in the middle, strengthened by walls and by bounded bastions at the corners, are placed the main buildings of the Castle. It is formed a square with a round tower at each corner, with a lofty gatehouse with four towers in the middle of the east side, reached from another gatehouse in front forming the entrance to the island. This is reached only by a bridge from the bailey before it, and the space within it, which also extended along the north and west sides of the island, formed the middle bailey. The walled enclosure formed the inner bailey, and within it along the south side the great hall with the buttery and pantry, with chapel on the east, and the great chamber and lodgings on the west. The kitchen occupied two stories of a projecting tower on the north, and, with the bakehouse, etc., filled the middle of the west side of the inner bailey. Having before it an outer gatehouse, and that on the east. These formed the bases of a bridge approach from a second island to the west, forming a large polygonal ground, strengthened by a wall all round and probably by another gatehouse and tower from the mainland to the west. The other feature to be noted is a narrow passage extending from the outer bailey to the north side of the main island, but at a distance from it, to the parade ground, which seemed also to divide the lake into a northern and a southern section. All the ruins of the Castle are of one date, beginning with their foundation by Gilbert of Clare, Earl of Gloucester, about 1267, and ending with the partial rebuilding of the great hall in 1310, when its north wall was reconstructed with a richly ornamented doorway, a porch, and three large and lofty windows, decorated with the ball-flower, and clustered piers to support the new roof inserted in the old wall. The Castle seems to have been destroyed during the insurrection of Owen Glou, about 1405, and in the following year a grant was made to a neighbouring landowner of leave to quarry building material from the Castle. The wholesale wrecking of the walls and gatehouses seems to have been effected by undermining them rather than by the usual accepted use of gunpowder. After a minute examination of the buildings under Mr. Hope's guidance the party returned to Cardiff.

On the morning of Thursday, July 27, the party began the day with a journey by train and by motor-car to St. Donat's Castle, the residence of Mr. Godfrey Williams. The building was described by Mr. Hope as a fortified house, begun probably in the XIIIth century, but considerably altered by Henry VII., consisting of the usual hall and living-rooms, arranged about a courtyard entered by a tall gatehouse. This in turn was covered by a small outer court and gate. Through the care of the late Mr. Morgan Williams, the last purchaser of the house, all the ancient features of the building had been scrupulously retained, and only restored when absolutely necessary; the house, consequently, still presented its original appearance to an unusual extent. The beautiful gardens, laid out in a series of terraces down the slope of the cliff on which the Castle stands, descend on to a large quadrangular parade ground at the sea-level. This has at the land end a long range of stabling with dwelling-houses at the ends and along part of the west side, all of Elizabethan date, and forming a unique example of Tudor barrack accommodation.

St. Donat's Church was next visited, and described by the Vicar, the Rev. L. E. Richards. It stands at the side of the castle cliff, and consists of a chancel and nave of XIIIth century foundation, with north porch, western tower, and an added chapel north of the chancel containing numerous monuments of the Strudling family. The Norman font is carved with rows of overlapping scales. In the churchyard is an exceptionally well preserved tall XVth century cross on a flight of steps.

From St. Donat's the journey was continued to Llantwit Major, when, after luncheon in the Town Hall, a quaint early Tudor building, a visit was paid to the parish church of St. Illtyd, which was described by the Rev. H. Morris. The building is of somewhat unusual plan. The chancel of the pre-Norman church which first occupied the site was replaced in the XIIIth century by (practically) another church, consisting of a nave and aisles of four bays and a chancel with south chapel (now destroyed). At the junction of the churches a tower was built. A south porch was also added to the old nave, which was also continued westwards by a curious building, or chapel of three bays, with wide doorways in the middle of each side, and having in each of the western angles an ascending staircase to a former gallery across the westernmost bay. This unusual arrangement seems to have been for the convenience of pilgrims to some shrine or relic which was displayed on an altar that stood in another gallery in the easternmost bay. In the XVth century the old nave, except its south doorway, was rebuilt and a two-storied porch for a priest added on the north-east part of the western annex. The church retains a fine XIVth century reredos with two side altars, with a vestry space behind, and in the old west

towards the end of the XIIth century, and the nave entirely rebuilt in two sections with features reminiscent of Wells and St. David's. The work also included two western towers. About the middle of the XIIIth century a strong tower with a vaulted basement, now used as a chapter-house, was begun on the south side of the presbytery, and somewhat later the beautiful eastern Lady Chapel was added. During the XIVth century the aisles were rebuilt, with butting arches across them for a proposed vault to the nave; this, however, was never added. The north-west tower was rebuilt in the XVth century, at the charges of Jasper Tudor, Duke of Bedford, and the south-west tower, together with its spire, in the XVIth century, as part of a very extensive series of repairs from 1536 to 1589, by which the church was finally rescued from a dilapidated and degraded condition of long-standing. After an inspection of the church and its fine series of tombs and monuments the journey was continued to St. Fagan's Castle, the residence of the Earl of Plymouth, who was still unavoidably absent. The house, which was described by Mr. Harold Brakspear, is now a many-gabled house of the XVth century, with rather staring modern brick chimneys, but occupies the site of an older building, to which the circuit wall belonged. The house contains some good panelling and carved overmantles, and in the courtyard in front is a large circular leaden cistern, richly decorated with oblong panels, with the Royal Arms, etc., and the date 1620.

At the evening meeting a paper, illustrated by lantern slides, was read by Mr. J. W. Rodger on the incised stone slabs of South Wales.

On Thursday, July 27, the party began the day with a journey by train and by motor-car to St. Donat's Castle, the residence of Mr. Godfrey Williams. The building was described by Mr. Hope as a fortified house, begun probably in the XIIIth century, but considerably altered by Henry VII., consisting of the usual hall and living-rooms, arranged about a courtyard entered by a tall gatehouse. This in turn was covered by a small outer court and gate. Through the care of the late Mr. Morgan Williams, the last purchaser of the house, all the ancient features of the building had been scrupulously retained, and only restored when absolutely necessary; the house, consequently, still presented its original appearance to an unusual extent. The beautiful gardens, laid out in a series of terraces down the slope of the cliff on which the Castle stands, descend on to a large quadrangular parade ground at the sea-level. This has at the land end a long range of stabling with dwelling-houses at the ends and along part of the west side, all of Elizabethan date, and forming a unique example of Tudor barrack accommodation.

St. Donat's Church was next visited, and described by the Vicar, the Rev. L. E. Richards. It stands at the side of the castle cliff, and consists of a chancel and nave of XIIIth century foundation, with north porch, western tower, and an added chapel north of the chancel containing numerous monuments of the Strudling family. The Norman font is carved with rows of overlapping scales. In the churchyard is an exceptionally well preserved tall XVth century cross on a flight of steps.

From St. Donat's the journey was continued to Llantwit Major, when, after luncheon in the Town Hall, a quaint early Tudor building, a visit was paid to the parish church of St. Illtyd, which was described by the Rev. H. Morris. The building is of somewhat unusual plan. The chancel of the pre-Norman church which first occupied the site was replaced in the XIIIth century by (practically) another church, consisting of a nave and aisles of four bays and a chancel with south chapel (now destroyed). At the junction of the churches a tower was built. A south porch was also added to the old nave, which was also continued westwards by a curious building, or chapel of three bays, with wide doorways in the middle of each side, and having in each of the western angles an ascending staircase to a former gallery across the westernmost bay. This unusual arrangement seems to have been for the convenience of pilgrims to some shrine or relic which was displayed on an altar that stood in another gallery in the easternmost bay. In the XVth century the old nave, except its south doorway, was rebuilt and a two-storied porch for a priest added on the north-east part of the western annex. The church retains a fine XIVth century reredos with two side altars, with a vestry space behind, and in the old west

end is collected a very interesting series of early crosses and grave-stones.

The ruined XVth century manor house of the Bassetts at Old Beaupre was next visited, and described by Mr. D. Alexander. Its chief features are the gateway of the courtyard in front, with the Bassetts arms and the date 1586, and the richly ornamented three-storied porch to the hall door, which bears the following inscription on three panels:—

SAY COWLDST TIOV EVER FYND
OR EVER HEARE OR SEE
WORLDY WRITCHE OR COWARD PROVE
A FAYT FVLL TRYND TO BEE
RYCHARDE BASSETT PAYING TO WYF
KATH ERINE DOVGILT TO SIR THOMAS IOINS
KNIGHT BWYLT THIS PORCE WITH TIE TONNES
IN ANO 1600 HIS YERES 57 I IS WIFE 55.

The "tonnes," or chimneys, have, unfortunately, utterly perished.

After viewing Cowbridge Church and the remains of the town walls and gate the party returned to Cardiff.

At the evening meeting Mr. F. King read a paper on the excavations on the Roman sites at Caerleon and Caerwent.

GENERAL NEWS.

Professional Announcements.

Mr. Roy Young and Mr. Cecil Masey, architects and surveyors, have dissolved partnership, and Mr. Cecil Masey is continuing the practice at the same address, 4, Holles-street, Cavendish-square, W.

Essex County Architect.

The Essex County Council have resolved to establish a county architect's department, to cost about 1,600*l.* a year, under the superintendence and control of a county architect at an annual salary of 800*l.*, with two assistants.

St. Paul's Bridge.

The Corporation of London (Bridges) Bill, authorising the construction of St. Paul's Bridge and the rebuilding of Southwark Bridge, has been withdrawn from the consideration of the Select Committee of the House of Lords. It has been referred to the Chairman of Committees of the House of Lords as an unopposed measure, and has been passed and ordered to be reported, with amendments, to the House of Commons for third reading. Additional protective clauses have been inserted.

Teaching and Examination in Art: New Government Scheme.

The Board of Education have constituted for a term of three years, from next September 1, a Standing Committee of Advice for Education in Art, amongst whose first members are already appointed Mr. E. K. Chambers, Chairman; Sir E. J. Poynter, P.R.A.; Sir C. Holroyd, Sir Cecil Smith, Professor R. Blomfield, A.R.A., Mr. G. Clausen, R.A., Mr. A. S. Cope, R.A., Professor Selwyn Image, Mr. S. J. Cartledge, and Mr. S. J. Solomon, R.A. In 1913 will be brought into force a comprehensive scheme of examinations to take the place of the current elementary examinations for art-class teachers' and art-masters' certificates, as well of the minute subdivision of art studies, the Board being of opinion that such stimulus and control as may be properly applied to the teaching of art by a central authority can be exercised best in visits of inspection, and that the teachers of the schools rather than external examiners should be charged with the duty of applying tests by examination. The Board will invite experienced headmasters of schools of art and others to consult with them for the establishment of a reformed course of national competition.

Memorial to William Penn.

After the Harvard Window in St. Saviour's, Southwark, comes the Penn Memorial in All-hallows, Barking. The former, designed by John La Farge, was the gift of Mr. Choate, when American Ambassador to Great Britain; the latter, which has just been placed, has been erected by the Pennsylvania Society through the generosity of its Vice-President, the Hon. W. A. Clark. Such associative memorials add greatly to the interest of London churches, and the new one, recalling the fact that William Penn, "an exemplar of brotherhood of peace," was baptised in the church on October 23, 1644, is welcome.

The design was originally undertaken by the late Charles F. McKim, but his untimely death prevented the realization of his plans. The design was finally prepared by his firm, Messrs. MacKinn, Mead, & White, New York.

Usher Hall, Edinburgh.

The leaden casket used in connexion with the laying of the foundation-stone at Usher Hall by King George V. on July 19 was made by Messrs. Morrison & Son, Randolph-place, Edinburgh, contractors for the plumbing work, to a special design by the City Architect, Mr. Williamson. In recent times there has been a revival of the art of lead-work, a material which possesses many artistic qualities, and in this case an endeavour has been made to adapt the material to the purpose in view on simple and sound lines of design. The casket is about 17 in. by 14 in., and is 4½ in. deep. The junction of the corners has a raised band, the edges of which are scalloped and perforated with a representation of the thistle at each angle of the cover. Banding the casket crosswise are broad bands of lead having stamped depressions, and at the point of junction there is imposed an ornamental device having a semicircular field carrying an impression of the City Arms, while on each quarter of the cover are the King's Cypher and the date, 1911.

A Central Imperial Board for Surveyors.

The Conference of Delegates which sat in London in May-June, under the chairmanship of Colonel Sir Duncan Johnston, have made a report upon the subject of reciprocity throughout the Empire in the examination and authorisation of surveyors. It was suggested that a Central Board should be set up to consist of representatives of every province, dominion, or state which licenses land surveyors, and of the Institution of Civil Engineers, the Surveyors' Institution, the Ordnance Survey, and the Colonial Office, to exert its influence in maintaining a uniform standard of examination under any arrangements for reciprocity that the several Governments of the Empire may adopt.

The New Guildhall, Londonderry.

The Irish Society have undertaken to defray the cost, estimated at 24,000l., of rebuilding the Guildhall, which, the tower excepted, was destroyed by fire three years ago. Some of the London Livery Guilds have agreed to contribute stained-glass windows to the new structure. The Mercers' Company offer 350l. for the filling-in of the principal three lights of the window in the Assembly Hall, provided that the five other lights are filled in by other Companies, and the Grocers', Girdlers', and Glaziers' Companies will share in the gift, which will constitute a memorial to King Edward, and mark the time-honoured association of the City and Guilds of London with Ireland and the plantation of Ulster.

Parish Church, Puddletown.

The Bishop of Salisbury has consecrated the new work for the restoration and enlargement to its former extent of the XVth-century chancel of Puddletown Church, which, together with an extension eastwards of the north aisle, has been carried out under the directions and superintendence of Mr. Ponting, diocesan architect. The *Builder* of August 7, 1897, contains some illustrations, after drawings by Mr. Roland W. Paul, of the Athelhampton Chapel, with two or three of the monuments, and in a "Note" in our issue of March 12, 1910, p. 287, we gave a short historical account of the fabric and antiquities of this highly-interesting Dorsetshire parish church.

Ceilings.

Mr. Werner Laurie is publishing a new library to be called "The House Decoration Series." The series will deal with such subjects as chimneypieces, staircases, porches, windows, etc., each written by a specialist. The volume just ready is "Ceilings and Their Decoration, Art and Archaeology," by Mr. Guy Cadogan Rothery. It deals with ceilings as an important medium for the expression of art, and treats of the origin of the vaulted, coved, and primitive ceilings; Greek, Byzantine, and Arabesque types, Mediaeval and Renaissance; Tudor period of fine plaster work; use of rose centres, mouldings, etc.; illumination—application to the decoration of the modern houses, etc. The book is fully illustrated.

Church Building Society.

The Incorporated Society for Promoting the Enlargement, Building, and Repairing of Churches and Chapels held its usual monthly meeting on the 20th ult. at the Society's House, 7, Dean's-yard, Westminster Abbey, S.W., the Hon. Sir E. P. Thesiger, K.C.B., in the chair. Grants of money were made in aid of the following objects, viz.:—Building new churches at Bristol, St. Ambrose, 50l. for the first portion; Harrow-on-the-Hill, St. Peter, Middlesex, 150l.; and Skirbeck Quarter, St. Thomas, Lincs, 100l.; and towards enlarging or otherwise improving the accommodation in the churches at Cricklewood, St. Peter, Middlesex, 60l.; Dinnington, St. Leonard, Yorks, 20l.; Hendon, St. Paul, near Sunderland, 20l.; Higbgate, All Saints, Middlesex, 50l.; Hoxton, Christ Church, Middlesex, 50l.; Luckington, St. Mary and St. Ethelbert, Wilts, 20l.; Shadingfield, St. John the Baptist, Suffolk, 20l.; Walton, St. Mary, Suffolk, 15l.; and Ipswich, St. Bartholomew, 60l. Grants were also made from the Special Mission Buildings Fund towards building mission churches at Canford Cliffs, Church of the Transfiguration, near Bournemouth, 25l.; and Bournemouth, Clare College Mission, Surrey, 35l. The following grants were also paid for works completed:—Plumstead, St. Mark, Kent, 500l., being balance of a grant of 1,000l.; Llandrindod Wells, Old Church, 20l.; Kendal, St. George, 85l.; Stoke Damerel, St. Andrew, Devonport, 100l.; Colehig, St. Michael, Devon, 25l.; Swinton, Holy Rood, near Manchester, 65l.; Woodford Bridge, St. Barnabas, Essex, 150l.; Kingsway, Holy Trinity, London, 200l.; Caversham, St. Andrew, Oxon, 100l.; Gainsborough, Holy Trinity, Lincs, 20l.; Lydgate, St. Anne, near Manchester, 85l.; Chesham Bois, St. Leonard, Bucks, 70l.; St. Mary-in-the-March, Kent, 50l.; Rodley Mission Church, near Leeds, 20l.; Picton, St. Hilary, Yorks, 20l.; and Stockwell, The Epiphany, Surrey, 20l. In addition to this the sum of 310l. was paid towards the repairs of seventeen churches from Trust Funds held by the Society. At this meeting the Secretary reported the receipt of an anonymous donation of 800l., 600l. being for the General Fund and 200l. for the Mission Buildings Fund.

COMPETITION NEWS.

Deptford Central Library.

At the last meeting of the Deptford Borough Council it was decided to invite quotations from quantity surveyors giving the terms on which they will be prepared to take out quantities, measure up for the certificates and final accounts, and generally do all the work of a quantity surveyor in connexion with the Central Library.

Proposed Central Fire Station at Hendon.

At the last meeting of the Hendon District Council, the Fire Brigade Committee submitted a report in connexion with the proposed central fire-station. They have decided to erect this on a site adjoining to the Council Offices at Central Hendon, with cottages at the rear for the housing of the firemen, and to arrange a competition amongst six selected architects to submit schemes for the consideration of the Committee. This was agreed to.

School, Walker Gate, Newcastle-on-Tyne.

The Education Committee of the City and County of Newcastle-on-Tyne invite from architects practising in the city designs and estimates for a senior mixed school and a junior mixed school at Walker Gate, each to accommodate 365 children arranged in the case of each school in classrooms of four for fifty each and three for fifty-five each; an assembly hall to be provided; the cost per head not to exceed 10l., and this to include everything except the site value, the caretaker's house, and boundary walls. The principal conditions are as follows:—The plans will be submitted to an assessor nominated by the President of the Royal Institute of British Architects, and the assessor's decision will be final.

The schools for which competitive plans are now invited will provide for a partial scheme only, as an infants' department will be added in the future. Competing architects must submit a block plan showing how

they propose to add the infants' department in future. The architect appointed to put out the partial scheme will have the right of planning and carrying-out the remaining portion of the scheme when the Committee decide to complete the work. The author of the design placed first shall be appointed to carry out the work; the architects whose designs are placed second and third in order of merit will be paid premiums of 20l. and 10l. respectively.

Architects must guarantee that the actual cost shall not cost more than the amounts set in their estimates.

A plan of the site may be seen and a copy taken at the Education Offices, Northumberland-road.

The designs must be accompanied by:—

- (a) A short and concise description of the buildings and such information as cannot be clearly shown in the drawings, and describing sanitary appliances and the arrangements for ventilation and heating.
- (b) A short description of the material to be used in the buildings.
- (c) An estimate of the cost.

We think the promoters might fairly be asked to supply a lithograph copy of the plan to competitors.

Competition of Plans for Town Hall, Can.

H.M. Trade Commissioner for Canada reports that a proposal is shortly to be submitted to a poll of the ratepayers of Winnipeg for the building of an annex to the Town Hall, at a cost of some 500,000 dols. (103,000l.). It is anticipated that a new Hall will have to be erected in the course of a few years, and if the proposal for an annex is approved, a competition is shortly to be opened for plans for both annex and the future Town Hall, together are to form one complete scheme. Communication in this connexion should be addressed by British firms to the Engineer, Winnipeg.

The New Australian Capital.

In reference to this competition, we from the *Journal* of the Royal Institute of British Architects that a deputation from the Council of the Institute waited upon Mr. Collins, who is acting for Sir George High Commissioner of the Commonwealth in London, and laid before him their petition. It is hoped that, as a result, the High Commissioner will be in a position to make such representations to his Government that the unsatisfactory conditions will be revised and the competition placed upon more equitable footing.

Skegness and District Cottage Hospital.

Owing to representations by the Committee has decided to appoint a professional assessor to adjudicate upon designs (which are to be submitted by September 8 next). Mr. Ernest R. St. G.R.I.B.A. (of Messrs. Sutton & Greaves, Bromley House, Nottingham), has been appointed to act in that capacity.

Proposed Additions to Union Offices, Salford.

In reference to this competition, we asked to state that it is restricted to architects in Salford and the immediate neighbourhood.

CORRESPONDENCE.

Gidea Park.

SIR.—The solicitors of Gidea Park, have sent me a copy of their letter addressed to you, published last Friday, which I carefully read.

I need hardly say that I had no intention of doing any injustice to Gidea Park, and I wish to express my regret if any statements contained in my letter may have given that impression.

It appears that the capitalised value of the ground rents created amounts to 16,230l. 18s. 10d., as against about 20 suggested by me. As regards the 4s. 6d. per week for watering, and 5s. per house per week (in certain cases 3s.) for opening and shutting the doors, I, of course, accept their statement that in cleaning the houses, that only twenty competitors availed themselves of this, and that therefore my calculation that

pany were receiving money at the rate of £5,000 per annum for these services was based on a misconception, i.e., that all the competitors availed themselves of this offer instead of the small number named.

I think it is fair to myself and to Gidea Park, Ltd., to say that I did not intend to have any animus against the promoters of the competition, but to point out that, from a professional point of view, it does appear to me of us to be extremely undesirable for architects to compete with each other to have the owners of estates of the financial, as well as the artistic, side of building them

quite understand that a large sum of money has been spent in the laying out of the site, advertising expenses, etc., but this expenditure would be necessitated in any development scheme.

It appears to me that these garden cities will be carried out with advantage to the promoters, builders, architects, and the public without mixing up the functions of the one with the other in any way.

A very strong argument against the present scheme from the architect's point of view is contained in a single sentence of a letter you published in your last issue from the Chairman of the National Town Planning and Housing Council, namely, "The garden city movement is tending to revolutionise the relations between building owners and architects."

Quite so. It is apparently tending to give their identities into one. I believe it is usually considered an egregious mistake for a building owner to become his own architect. But I have yet to be convinced that it is not an equal mistake for an architect to become his own building owner, in competition with other architects.

It was to this point alone that I was endeavouring to draw attention.

MAURICE E. WEBB.

Sir,—Mr. Maurice Webb's letter in your issue of July 21 is extremely interesting in that it should serve to draw attention to the methods of the promoters of the competition. The Gidea Park idea is admittedly a very new one. There appears to be a landowner who is desirous of developing his property, and by use of the magic words "Garden City" and "Town Planning" a certain fancy wrapping has been given to what remains a business proposition to get rid of it. I take it there is no philanthropic state—there does not appear to be anything to be given away at Gidea Park—yet the proceedings seem to have conveyed an impression to this effect.

Cannot this be admitted; that it is a business proposition to be carried out on proper lines? The promoters are not the only people who have attempted to do model speculating building.

So far as the architects are concerned who have been content to become speculators as well as architects, they went into the competition with their eyes open, thirsting for glory. They scarcely realised that the competition, and the prizes, and the fancy wrapping were the means to the end of disposing of land and the creation of ground rents. The architects cannot complain, and emphatically have their wares on offer in the marketplace. It is not an unifying thought that they may accept Mr. de Jersey's invitation and spend their Saturday afternoons posing as spiders in the webs they have built.

Another danger of the competition is that a number of young men of slender resources have been tempted to take up land and throw money, and failing to sell their houses they find themselves confronted with foreclosure and bankruptcy.

It is far safer and much better for the professional man not to enter the marketplace as a speculator. It needs special training, and, as he who has had a large experience in this class of work, I do most seriously wish to advise Brother architects, and especially the younger men, not to speculate themselves. Look for builders if you like, and there is plenty of precedent from Mr. Shaw downwards—be house-designer, not house-dealer.

C. H. B. QUENELL.

Sir,—We have just noticed the letter from Mr. Maurice E. Webb in your issue for July 21, and as architects for seven of the competition houses, wish to draw your attention to one or two of the statements made by Mr. Webb.

In the first place, no one expects that the company instituting the competition anticipate making a loss over the estate, and there is no doubt that the expenses of the competition have duly been taken into account. We note that the capitalised value of the ground rents created is put down at £20,000, but deducting the original value of the land, the cost of road-making, sewerage, etc., the profit will not be found to be exorbitant. Meanwhile, half the ground being taken up on lease, there is very little possibility of selling the improved ground rents until the houses are let or sold, which means that the company will not receive the price for the whole of the freeholds until the properties are all occupied.

We beg to differ from the statement made, that the company are charging the competitors £50 per house per week for opening and shutting them every day; this sum includes cleaning down and scrubbing out the houses weekly, so that the out-of-pocket expenses of the company must, at any rate, be 3s. per week per house, and as competitors with more than one house can get the subsequent houses attended to for 3s. per week, it will be seen there is very little surplus for superintendence and profit.

Then, as to the charge of 4s. per week for watering the gardens, this they undertook to do three times per week for the back and front gardens, probably taking the man one and a half hours on each occasion. Although we did not avail ourselves of this offer, we do not consider it would have been an overcharge.

With reference to the letter of July 12, we do not see why builders should not be urged to have their own representatives on the property, especially on Saturday afternoons (and we may say Sundays); if they sold or let they would not have to pay the estate commission. Likewise the company's offer to act as agents at the usual commission; Mr. Webb may consider this "a handsome consideration," but on this point he had better ask any well-known firm of estate agents and surveyors.

Without wishing to be discourteous to Mr. Webb, it seems to us that his misconceptions are due to the reason which he states, i.e., that he is not a competitor, nor is he interested, financially or otherwise; he does not know the facts, therefore his criticism is wide of the mark, whilst the only question he opens up of any value is whether it is advisable for architects to take up a building speculation. Apart from the fact that the land is taken up about equally between builders and architects, we should like to ask if architects are to be deterred from placing their money (if they have any) in furthering their own work? If so, it means that they are not to be allowed to speculate in that security in which they have the greatest expert knowledge, and, presumably, the greatest chance of success.

GRIPPER & STEVENSON.

The King Edward Memorial.

Sir,—As so great dissatisfaction has been expressed, both in the Press and House of Commons, as to the unsuitability of the site chosen by the Committee for the King Edward Memorial (London), I am venturing to submit to you an alternative proposal.

The site I now venture to suggest is situated about halfway between the Albert and Victoria Memorials, and immediately faces the Museum at South Kensington, which bears the name of the parents of our late King.

This island site, which lies between Cromwell gardens and Thurloe-place, is now, and has been as long as I can remember, a disgrace to this important part of the capital on account of the deplorable unoccupied property that stands on it, and the whole of which, I believe, can now be bought for a reasonable sum. The suggestion of this site being acquired and a monument of King Edward being erected thereof has doubtless been made by others, but I imagine that the reason why it has not been recommended by

the Memorial Executive Committee has been, first, because the amount collected would not justify the spending of £30,000, or £40,000, for a site simply for the erection of a monument, and, secondly, because if the site was cleared of its buildings the houses that would overlook it on the south and west sides would form an unsuitable background for a monument. But the scheme which I now venture to propose overcomes these objections, and is as follows.—That the little triangular site of ill-grown trees and shabby grass immediately on the east side of the property should be cleared and partly thrown into the roadway, and that the property on the island site be purchased and a public building erected thereon to house either the Science Museum, the future site of which has recently been so warmly discussed in the Press, or the London Museum, which is now temporarily quartered at Kensington Palace. A building on this site would provide a superficial floor area of about 50,000 ft.

My proposal is that the actual memorial to King Edward should be placed at the east end of the site looking towards the Brompton-road, from the centre of which thoroughfare one would obtain a direct vista of the memorial, extending for a distance of 1,100 ft. down the centre of the unusually wide road in front of the Victoria and Albert Museum, and it is surely impossible to imagine a finer vista in an important London thoroughfare for a monument than this.

In order to provide a suitable and effective background to the statue, the facade of the east side of the suggested museum building could be designed as part of the memorial in the form of a screen with a bold niche in its centre for the statue and a large fountain basin at its base.

One of the chief reasons why our statues invariably look so feeble is on account of their unsuitable backgrounds, but it is difficult to imagine a more effective background than such a screen as is here suggested.

Although such an architectural proposal has perhaps not yet been attempted in England, the idea is by no means original, and I frankly confess having borrowed the idea from the Trevi Fountain in Rome. Those who are acquainted with this masterly work of Bernini—although some give the credit to Nicola Salvi—either from illustrations or pleasant memories of visits to the Eternal City, when they perhaps have drunk of the virgin water from its basin, half believing in the superstition that by so doing it will ensure their returning to Rome—will at once realise how effective a memorial treated after this manner would look on the site here suggested. The measurement of the centre portion of the facade of the Trevi Fountain is about 75 ft. wide and 90 ft. high, and the width of the east side of the suggested museum would allow of a screen slightly wider than this.

As for the question of cost, I think it would be found that £100,000, would cover the total outlay of purchasing the property, the erection of such a museum building as I have suggested, and the provision of an adequate sum for a statue of the King.

F. W. SPEIGHT.

INTERCOMMUNICATION COLUMN.

Rainwater "Tipper."

Sir,—Your correspondent "Clerk of Works," in your issue of July 28, p. 101, inquires for an automatic rainwater separator.

There are several to be had, but one of the best is that of Mr. C. G. Roberts, of Haslemere, Surrey.

H. M. DICKINSON, A.M.I.Mech.E.

Sir,—Referring to the letter in your last issue, signed "Clerk of Works," a rain-water separator such as he describes was being advertised by Mr. C. G. Roberts, of Haslemere, in 1898, but whether same is now obtainable I cannot say. H. A. TURNER.

BOOK RECEIVED.

BUILDING IN LONDON. By Horace Cubitt, A.R.I.B.A. (London: Constable & Co., Ltd. 31s. 6d. net.)

EDITORIAL SUMMARY.

The leading article is entitled "The Past Session."

A second article deals with the Statutory Qualification for Surveyors (p. 120).

Notes (p. 121) include: "Llangollen Town Planner"; "Presentation to M. Daumet"; "Copyright."

An illustrated article on "Montreal" will be found on p. 122. In this connexion some Montreal buildings are illustrated in our inset plates.

The result of the summer examinations of the Royal Institute of British Architects will be found on p. 124, where also is given some information on the special examination of Licentiates to Qualify for Candidature as Fellows.

Our report of the proceedings of the Royal Sanitary Institute Congress at Belfast is continued this week (p. 127).

A preliminary account of the proceedings of the Royal Archeological Institute, in connexion with their annual meeting in South Wales, is given on p. 130.

Correspondence (p. 132) includes letters on "Gidea Park"; "The King Edward Memorial."

The illustrated Monthly Review of Civic Design (p. 135) includes: "Hyde Park Corner Improvement"; "Sanctuaries for Wild Life"; "London County Council White Hart-lane Estate"; "Town Planning Conference"; and notes.

The Building Trade Section (p. 140) contains: "Some Legal Questions about Extras"; "Building Plans and Building Prospects"; "London Association of Master Stonemasons"; "Federation of Building Trade Employers"; "Projected New Buildings in the Provinces"; "Applications under the 1894 Building Act," etc.

Law Reports (p. 144) include: "Rights under the London Building Act"; "Action by Contractor against Building Owner."

MEETING.

TUESDAY, AUGUST 3.

Guild of Architects' Assistants.—Visit to the London Opera House, Kingsway. 6.30 p.m.

FIFTY YEARS AGO.

From the *Builder* of August 3, 1861.

Proposed New Bridge at Blackfriars.

THE Committee of the Corporation for the Bridge House Lands have had under their consideration for some time the best mode of providing for the public convenience, which has been somewhat jeopardised by the state of the present bridge. After much deliberation they determined to call upon engineers for designs for a new bridge, leaving them quite unfettered in their arrangements and designs. The productions of these gentlemen, and of some rising engineers who were desirous of bringing forward their ideas voluntarily, have been under the consideration of the committee. The designs submitted to them are twelve in number, many of them elaborately drawn, with details of construction. The engineers were Mr. Barlow, Mr. Breton, Mr. Goodchild, Mr. Brunless, Mr. Joseph Cabitt, Messrs. E. Bidder and E. Clarke, Mr. R. W. Mynne, Mr. Fowler, Mr. Hawkshaw, Mr. G. Rennie, Sir John Rennie, and Mr. Page. From these the committee have selected the design of Mr. Page, and appointed him the engineer for its construction.

THE BUILDER.

THE LONDON COUNTY COUNCIL.

THE usual weekly meeting of the London County Council was held on Tuesday in the County Hall, Spring-gardens, S.W., Mr. E. White (Chairman) presiding.

LOANS.—A loan of 1,000*l.* is to be made to the Battersea Borough Council towards the cost of street improvements, and 1,500*l.* to the Poplar Borough Council for construction of a pipe sewer. Loans are also to be made to other Borough Councils as follows:—St. Marylebone, 4,531*l.*, for electricity works; Shoreditch, 2,520*l.*, for paving works; Woolwich, 4,841*l.*, for electricity works; Bethnal Green, 20,000*l.*, for erection of a town hall; Hackney, 4,364*l.*, for electricity works; Hampstead, 7,550*l.*, for electricity works, and 14,650*l.*, for erection of offices; St. Pancras, 4,896*l.*, for paving works; Fulham, 3,000*l.*, for street improvements; Westminster, 19,125*l.*, for street improvements; Islington, 5,500*l.*, for electricity works; Camberwell, 1,193*l.*, for street works; and Poplar, 34,995*l.*, for electrical works.

THEATRES.—It was reported by the Theatres and Music Halls Committee that various alterations are to be carried out at the Comedy Theatre. The Committee also approved of proposals submitted by Messrs. F. Matcham & Co., relating to the construction of the Middlesex Music Hall, Drury-lane, on the site of the existing hall and adjoining premises. The Committee approved amended drawings of the Yiddish Theatre, Commercial road, E., showing arrangements for an accommodation for 1,250 persons.

ENGINEER'S DEPARTMENT.—The Establishment Committee reported that, owing to the retirement of Mr. C. Elwin, Chief Assistant Engineer, it was proposed to promote Mr. S. B. Sandiford to that position.

HORNIMAN MUSEUM.—Various repairs and painting work is to be carried out at this Museum at a cost of about 70*l.*

LIMEHOUSE.—It is proposed to enlarge the Northey-street School, and provide a revised accommodation of 276 in the infants' school.

CAMBERWELL.—The Camberwell School of Arts and Crafts is to be enlarged at a cost, including electric lighting, of about 19,120*l.*, and tenders are to be asked for during the summer recess of the Council.

SCHOOLS.—The Education Committee stated that it was desirable that wood-block flooring should be laid at the following schools: Moreland-street, Finsbury; Hammond-square, Haggerston; Hoxton House, Hoxton; Great College-street, St. Pancras; and that the work should be carried out by the Acme Flooring and Paving Company, Ltd., at the rate of 6s. 6d. per square yard.

WANDSWORTH.—It was also stated by the Committee that it was proposed to erect a one-story building to replace the existing school of the Sacred Heart (Roman Catholic) at Wandsworth.

FIRE-STATION.—Owing to the unsatisfactory lighting and ventilation at the Scotland-yard Fire-station, it is desirable to carry out various alterations and improvements at an estimated cost of 115*l.*

LONDON ELECTRIC RAILWAYS.—It was stated that a loop line was to be constructed between the present terminus of the Charing-cross, Euston-road, and Hampstead Railway, under the forecourt of the Charing-cross (South-Eastern Railway) Station, and passing under the Charing-cross (District Railway) Station on the Victoria-embankment.

BATTERSEA PARK.—Various repairs are to be carried out to the river wall at this park at an estimated cost of 300*l.*

TRAMWAYS.—The Highways Committee reported that it was proposed to construct a loop line at the Finsbury Park terminus, between Blackstock-road and Finsbury Park-road.

It is also proposed to carry out the following tramway works:—Reconstruction of existing tramways from Baring-street to Finsbury Park, via Southgate-road and Green-lanes, etc. Construction of tramways from Herne Hill to Brixton, and extension of existing tramways in East India Dock-road.

WHITE HART-LANE.—The Chairman of the Housing of the Working Classes Committee reported that, in his opinion, this estate was suitable to be developed on the lines of a

[AUGUST 4, 1911.]

garden suburb and town-planning system which would provide a variety of houses at moderate rental, and also larger houses at middle class occupation.

It was also stated by the Committee that tenders are to be invited for the erection of cottages, and construction of roads and sewers on the Norbury and White Hart-lane estates.

ILLUSTRATIONS.

Temple of Artemis.

IN this restoration of the Hellenic Temple of Artemis (Diana) at Ephesus (IVth century B.C.) I have attempted to piece together the many fragments found, by the help of some of Wood's measurements, those taken by me during the British Expedition conducted by Mr. D. G. Hogar, and of the many portions preserved in the British Museum.

I can claim that the disposition of the pediment would key with and fit upon the remains uncovered in 1904-5. The distance between the outer face of the lowest step from north to south is 239 ft. 4½ in., and the height given the columns is that calculated by Ferguson, namely, 60 Greek ft. = 6 ft. 9½ in. English.

This structure followed upon the lines of previous ones (see the *Builder*, November 1906), excepting that it was built in the prevailing style and was much more magnificent. It was based upon a terrace, and the cornice increased in height, and was also enriched with much architectural carving and magnificent sculpture. The sculpture shown to the column follows the lines adopted by Dr. Murray. The enriched bases, mouldings, and arrangement of the podium follow that of the temple of Apollon at Miletus, which was erected subsequently to the Artemision.

The entablature is rendered in the Ionic style, with high cymatium and no frieze. Led dentils on square consoles are introduced to act as cantilevers to support a projecting cornice with the cymatium above. There is no direct evidence that consoles were introduced in the entablature, as unfortunately none have been found, nor even a length of corona. In the Archaic Temple evidence is against their introduction, unless the corona oversailed, to a great extent without support, as a length was found with a sunk bed with no vestige of encorment by consoles.

Fortunately a completed section of the entablature of the temple at Priene, many miles away, has been made, and as this temple was erected shortly after the Greek Ephesian one it was probably a reduced rendering. But I have given the shape of a design of the dentals after those of the Temple of Apollo.

The angle of the pediment is that chosen by Dr. Murray, and the sculpture I suggest in the tympanum represents Artemis mothering her devotees, who are bringing, conducted by the Messenger, their offerings to her. The "Goddess with the Lions" is placed in the acroterion at the apex of the pediment, as was done in the restoration of the Archaic Temple and the well-known type of the Ephesian goddess is placed as the cult statue.

My thanks are due to Mr. Gilbert Bayes for his beautiful rendering of the figure sculpture.

A. E. HENDERSON.

Montreal Illustrations.

OUR illustrations of the Canadian Bar of Commerce and other buildings in Montreal are given in connexion with an article on p. 122, where some particulars of the building illustrated will be found.

CORPORATION OF LONDON LIBRARY AND ART GALLERY.

The annual report sets forth that, in 1910 the total number of readers and visitors at the Guildhall Library amounted to 472,297—the highest recorded. The Art Gallery was visited by 125,641 persons, and the acquisitions cost press twenty pictures of the Gascoit bequest and many oil-studies and crayon drawings by the late J. M. Swan, R.A. The Library Committee have deputed Mr. Arthur J. Jewer, F.S.A., to compile a full record of all monumental inscriptions in the City churches, as well as of the stained glass windows, sword-rests, armorial achievements, etc.

MEMORIAL TO KING EDWARD VII.

HYDE PARK-CORNER IMPROVEMENT.

By PROFESSOR S. D. ADSHEAD.

A SERIOUS objection to placing the King Edward Memorial at the Piccadilly end of the Broad Walk in Green Park is met with when we come to consider that however fine such a memorial might be as a monument in itself it must necessarily block the fine vista which this walk provides of the Queen Victoria Memorial from Piccadilly.

About the space in front of Hyde Park-corner there is much need for improvement. The entrance to Hyde Park, Apsley House, and the arch at the top of Constitution-hill are amongst the finest architectural features in London, and yet the open space to which they form the scenic background is one of the most confused and complicated medley of street intersections in London. Very little alteration would convert this chaotic confusion of traffic routes into a simple and well-arranged "place," at the same time providing a magnificent site for a King Edward Memorial, a site which as a centre of interest and view point could not elsewhere be surpassed.

The accompanying illustration shows how the rearrangement could be effected. Green Park would be extended out into Piccadilly, and the axiality and continuity of Piccadilly, as a great thoroughfare, would thereby be emphasised and improved. Grosvenor-place could be continued as a street of even width until it emerged with Constitution-hill and

Grosvenor-gardens into the symmetrically disposed "place"—the *entre court* of London's two finest parks.

The narrowing of Grosvenor-place and its altered alignment would provide space for a garden where at present is merely a waste of asphalted pavement and woodblock. St. George's Hospital, which is shortly to be taken down, will no doubt be rebuilt as an hotel or block of high-class flats. The opportunity which the occasion offers for an elevation suited to the character of the site ought not to be missed.

The King Edward Memorial might then worthily occupy a prominent position in the centre of the Piccadilly side of the new "place." It might take the form of a figure on a pedestal with minor groups on either side. The whole might be set on a semi-circular podium facing Piccadilly, and from behind might be a fall of water into a basin below, with symbolic sculpture at either side.

The statue of Wellington would need to be removed a few feet further toward the east, and the altered conditions would create a vacant site for a statue similar in design to the west.

By an arrangement of islands and street refuges, as shown in the illustration, traffic going in different directions would cross at right angles, instead of obliquely in the present dangerous manner.

The trees which are dotted about without any particular method of plotting, and which merely obstruct the view in every direction, might be taken up and transplanted; some of them so as to form a background to and to accentuate the memorial, and others to outline the shape of the "place" and the proposed garden off Grosvenor-place.

Such an improvement could be made without any structural alteration to any existing building. Practically all that it would mean of alteration would be the relaying of a portion of the road surface, readjusting the Park railing, erecting new piers at the entrance to Grosvenor-place and Grosvenor-crescent, and altering the position of the Wellington equestrian statue.

A small Committee of members of Parliament has been formed for the purpose of pressing this scheme on the King Edward Memorial Committee. It is claimed that it extends instead of diminishing the Park area, that it greatly improves the traffic intersection at a dangerous spot, that all the historic features of the site are retained, and that a fine position is secured for a statue of the late King. It is further urged that the scheme would be comparatively inexpensive and would leave sufficient funds for the provision of the Shadwell Riverside Park as an East-end Memorial.

SANCTUARIES FOR WILD LIFE.

By J. S. M. WARD, B.A., F.R.Hist.Soc.

THE example set by the United States in retaining a large tract of country as a sanctuary for wild life has been followed by several other countries, including Canada and Switzerland. It is certainly time that something similar should be done in England.

In spite of the laws against the destruction of wild birds, thousands are trapped and shot each year. Nevertheless, these laws have done much good. They should, however, be strengthened and more rigorously enforced, and might well be supplemented by sanctuaries in which all wild life, birds, beasts, and plants, would be immune. Men might then study nature at first hand, but might slay nothing.

Wild creatures need some place of refuge, where they can, for a time, be safe from interference. Their young must be protected from the cruelty or thoughtless ignorance of boys and men. Gradually the really wild country is disappearing. Sometimes it is built over. This, indeed, is a very real danger, for when wild and beautiful country is opened up by rail or tram from a big town, it is soon covered with "eligible villa residences." Parts of Haslemere have quite recently been spoilt in this manner, and now the builder has commenced his devastations upon the slopes of the North Downs, above Reigate.

The growth of smallholdings, also, cannot fail to have a most disastrous effect upon the wild life of this country. The peasant owner, as the experience of the Continent proves, is, of all men, the most destructive of wild creatures.

England is becoming by degrees a "Black Country," and one shudders to think what the rural districts will be like 200 years

hence. Probably they will most closely resemble allotment gardens.

If this is likely to be so, it behoves every one who has either any artistic sense or any love of nature to endeavour to save sanctuaries near to our different towns. This subject might perhaps be taken in hand as an extension of the town-planning movement.

The expense need not be so heavy as might be supposed, for I have included much common land. In that case it would only be necessary to extinguish the sporting rights of the lords of the manor, which, however, should not be a very heavy item.

We may divide the rest into two divisions:—
(1) Land unsuitable for agriculture;
(2) and that which is suitable.

Of No. 1 we may make two divisions:—

(a) land either used or suitable for forests.
(b) land unsuitable.

Of (a) we may take parts of Ashdown Forest as an example; of (b) much of the South Downs.

Forestry should be encouraged wherever possible, and will often help in the formation of sanctuaries, but it must be remembered that, although one of the best trees for commercial forestry is the pine, most wild creatures seem to avoid forests of this tree. Oak, on the other hand, has not this disadvantage.

Therefore, wherever afforestation is undertaken by the State, wild life should, so far as is possible, be encouraged.

Moreover, much land in private hands might become sanctuary to all practical purposes without the country going to the expense of becoming its owner. Taxes might be remitted or reduced, especially the undeveloped land tax, where certain rules for the preservation of wild life were accepted. This would be found useful in the case of both (a) and (b). But only so long as they remained outside the building zone. The cheapest way to

prevent their being built on would doubtless be to pay the owners a sum in return for which they should agree not to build over the district mentioned, nor to destroy its wild character.

The unearned increment tax will probably not remain at its present low figure, and this will render many landowners willing to forego the future possibility of increased rents through building, in exchange for an immediate return, in the shape of a lump sum, which can be invested.

Of No. 2 (agricultural land) it will be noticed that I have been very chary. I have only included it as a rule (c) where it was necessary to connect up portions of common land or of No. 1. Or (b) where it lay along the banks of a river, as in the "Mole reserve."

It is now generally accepted that the banks of rivers should, as far as possible, be preserved as open spaces. Rivers thus become pleasant places for recreation and avenues for admitting air and sunlight into our cities, besides being things of beauty.

In America and Switzerland it has been possible to reserve a single huge tract of land, e.g., the Yellowstone Park, as a national sanctuary.

This would not be practicable in England, nor, if possible, would it be desirable. Much of our flora and fauna is so local that, if we are to save all species now existing, we must have many scattered sanctuaries.

This, however, is an advantage, as it will be found easier to arouse enthusiasm for a local sanctuary individual to each important town, than for one huge tract somewhere in the north of Scotland.

In a short article like this, there is not space to go into much detail, so I do not propose to discuss fully the guarding of these sanctuaries. Probably two or three paid wardens would be appointed to each, assisted by amateurs from the local natural history clubs.

1. Effingham Reserve.
2. Netley Reserve.
3. Whitdown Sanctuary.

4. Raunmore Common.
5. Boxhill and Headley Heath Reserve.

6. Walton and Banstead Heath Reserve.
8. Betchworth Park Reserve.

9. Upper Mole Sanctuary.
10. Penslake Reserve.
11. Friday-street and Leith Hill Reserve.

Already two or three such sanctuaries exist. Epping, though an accidental one, has been a great success in this direction.

It is only just that mention should be made of the work done by the National Trust and by the Commons and Footpaths Preservation Society. These two bodies correlate their work to a very considerable extent, and between them have saved many of the most beautiful spots in England. There is every sign that they have no intention of resting on their oars, but that they intend to extend their work in the very direction to which I have referred.

The National Trust is appealing for 7,000l. to buy 60 acres on Colley Hill, overlooking Reigate, and including a long stretch of the Pilgrims' Way. An adjacent 20 acres have been already given to the town, so that the whole will cover 80 acres, and will, moreover, connect up with Walton Heath. The National Trust are making a special point on this occasion that it is to be treated as a sanctuary for wild life.

I would especially recommend local natural history societies to try to raise funds for local reserves. It is wonderful what an enormous amount of wild life will crowd into even a few well-chosen acres. The reserve at Wicken Fen proves this. As an example of the treatment suggested, a map is given of that portion of Surrey around Reigate, with suggested reserves outlined on same.

Some may object that I have suggested twice as many sanctuaries as are likely to be set aside. This is true, but the farmer and the speculative builder will see that too much is not given up; the danger is that too little will be saved. Moreover, many of the suggested reserves may be regarded as alternative.

Finally, I have only attempted to give the merest outline. The time has not yet come for settling the details. These can be best decided by free discussion. If I have succeeded in arousing the interest of my readers in the idea, this article will not have been in vain.

TOWN PLANNING CONFERENCE.

THE following is a continuation of our report of the Town Planning Conference organised by the Institution of Municipal and County Engineers, and held at West Bromwich. A short report of the earlier proceedings was given in our issue for July 14.

Mr. W. Ransom, A.M. Inst. C.E., Worcester, in a paper on "The Prevention of Slums," said that much will have to be done to create a healthy tone among the existing tenants of slumdom. Many of such have lost all love for healthy, natural conditions, and unless their best social instincts are restored by some educational means it will be very difficult to ever translate the occupiers of slumdom into suburban surroundings. If we once get the

dwellers in slumdom thoroughly dissatisfied with their conditions of living they will make an effort to uplift themselves. Local authorities should always be ready to give a helping hand to such who are anxious to improve their surroundings. Health or sanitary societies might very well be formed for the encouragement and reward of such tenants, just as in London the Window Gardening Association does much to encourage a love of nature.

The Housing and Town Planning Act of 1909 has opened out a world of possibilities. Municipal engineers have many opportunities for educating public opinion upon such matters, and they should endeavour to make authorities take a wider outlook. It will be only by inculcating public spirit amongst all those interested in the development of the suburban zones that we shall be able to preserve the advantages of such areas in perpetuity for the good of the whole community.

Mr. H. Stilgoe, Birmingham, having expressed his thanks to the President for the phenomenal meeting which he had arranged, said this question of town planning was not merely a development of small areas on garden city lines, but it was the whole planning of a town, the means of communication, the waterways, the railways, and so on, and looking at those means of communication, seeing which was the right place to put works and factories, to allocate their district, and to allocate the different parts of the city for different building purposes. In an old city this was more or less impossible, because their great works had to be where the means of communication now were. Of course, it was possible to put in a railway line or a canal, or other means of communication into the north or north-east part of the town, if it was in the direction of the prevailing winds. No doubt that was the right place to put the buildings which might be offensive to dwellings. Then on the south and south-west to preserve open as much as possible the land, and to see that portion of it was reserved for their best residences. That was one aspect. That was perhaps looking at town planning from the whole point of view; that was a city building from its commencement. In laying out their outside districts the first thing to do, as Mr. Brodie had said in his very able paper, was to drive out their great arterial roads making the means of communication, and then to connect these arterial roads by links forming the ring road or a series of ring roads as might be necessary. If those who had preceded them had been only a little more far-seeing they would not have allowed the buildings to be brought up to the hedgerows of the country lanes in the manner they had. It was impossible to widen them except at great expense. In arranging for one of their town-planning districts they had come to a provisional agreement, subject, of course, to the approval of the Council and of the Local Government Board, whereby the owner was willing to give land for the wide road,

but that for the road-making he contributed what it would cost to make an ordinary by-law road. That might be considered a very fair and reasonable solution. They came to the restrictions of buildings per acre. In laying out a scheme they would embrace a part of the district where the streets were already laid out and the buildings not yet erected. They would in that case have to be somewhat easier to the owner of the land than to the owner of an estate where roads were not already laid out. The question of restricting the number of houses to the acre was one which was very definitely dealt with. A person could not obtain compensation by reason of the restriction of the number of houses per acre and so on. In laying out a town-planning scheme one must consider what was the fair and right number of houses per acre to make the restriction to. It was going to hit three people at least; one was the landowner, another was the builder—they might call him a speculative builder if they liked—and the third was the local authority. It had been said in one of the papers that they could build fifty-six houses per acre under the by-laws of the town. All he could say was that the sooner the authority got its by-laws amended the better. The Local Government Board would be very considerate in that matter, and give every assistance in bringing those by-laws to a proper shape. Some of the most useful artisans' dwellings in and round about Birmingham were built on leasehold land leased for ninety-nine years at 2l. 5s. per plot, and they were building on an average from eighteen to twenty houses per acre. They had got to consider how much the landowner could stand, how much the local authority could stand, and how much the builder could stand. The house he spoke of was built on leasehold land leased for ninety-nine years at an annual ground rent of 2l. 5s. to 2l. 10s. The building plots had a frontage of 5 yds., and were from 40 yds. to 45 yds. in depth. The houses were set back 10 ft. from the side of the roads, which were 42 ft. in width, constructed in the best manner, and had a 26-ft. carriageway and two 8-ft. footpaths paved with concrete flags, and having granite kerbs and channels. The accommodation was, on the ground floor, a hall entrance, 2 ft. 9 in. wide; a sitting-room, 11 ft. 6 in. by 11 ft., with bay window; a kitchen or living-room, 14 ft. by 13 ft.; scullery, 11 ft. by 8 ft.; pantry, 5 ft. by 3 ft.; coal-house, water-closet, and ash bin house. On the first floor, two bedrooms, 14 ft. by 11 ft. 6 in. and 13 ft. by 11 ft. respectively, and a bedroom 14 ft. by 8 ft., with a bathroom having closet therein. The houses were well built, and could be purchased for 160l. each. He mentioned that to show that if a builder gave a man a house of that character at 6s. 6d. per week, and he could afford to sell it at 160l., they could not shave them down very much. If a man was going to have a 4s. 6d. cottage and they gave him three rooms, that was another thing

L.C.C. White Hart Lane Estate, Tottenham: View of Tower Garden from the Terrace.

(By permission of the R.I.B.A.)

altogether, but these were good houses that an artisan earning a good wage ought to live in. He did not think that the by-laws could be modified to the extent foreshadowed in one of the papers. As a rule, even if the builder built right up to the full meaning of the building by-laws, he did not make too good a job. He did not know of a by-law which said that the roof tile should be of a particular quality, but he did know the importance of this. The Birmingham report on the visit to Germany had been published, and might be obtained from the City Stationery Department at a small sum by anyone who desired to obtain it.

Alderman Cain, Bootle, said his borough was a comparatively new one. They only dated from 1869, and previous to that date they had only very limited by-laws. The old Byways Act was then in force, which did not give very great powers, and from then to now they had been fighting to improve the locality. The ground landlord there, was Lord Derby, and for many years he would only grant leases for seventy-five years, which was not a great encouragement to the speculative builder to go on with first-class buildings. He was pleased to say Lord Derby was now granting terms of 999 years, which would be a great encouragement to builders. He had also been very generous to them in many ways, such as the widening of streets.

Mr. W. Harpur, Cardiff, remarked that the mistakes of the past could not honestly be laid at the door of local authorities and their engineers, but to the lack of legislation enabling them to have sufficient control in the matter of town planning.

Mr. T. Adams (Local Government Board) said he would like to congratulate the Institution on taking up the subject of town planning for discussion at the Conference, and concentrating their attention. He had just had the privilege of visiting America, and for a month had studied the lines on which they were planning cities there. They were devoting themselves with enthusiasm—and their enterprises were well worth studying—to the laying out of parks and civic centres, but were neglecting the problems of public health. So, while they were looking after the interests of the people with regard to parks, they found that the sanitary conditions carried them back to what they had in this country about the time of the passing of the Public Health Act in 1875. Town planning was not merely a question of civic centres and open spaces, but it was really a matter which should begin at the home life of the people, and from that rise up to the civic centre and the main artery. So all considerations which affected the civic life from the individual standpoint, as well as from the standpoint of the community as a whole, should be taken into account. He could make one general suggestion which some councils had already brought into operation. Whether they proposed to apply to the Local Government Board or not, they had the right to prepare a town-planning scheme. A surveyor who had any time on his hands, and ideas to put on paper, should be considering from a comprehensive point of view the whole question of laying out the city with the development of which he was associated, studying the developments that had taken place in the past, and how to make suggestions to his Council as to the growth in the future.

Mr. Harrison, Wellingborough, said that his experience of towns with working-class populations went to show that grass swards were merely a nuisance. The best way perhaps was to have a slip in the centre properly fenced and taken care of. In that case it would be necessary to widen the street to 46 ft. They could hardly expect those who were laying out streets to bear the expense, and if the landowners were willing to give the 6 ft., or whatever it might be, he thought the Urban Council should contribute the cost.

Mr. J. F. Smillie, Tynemouth, remarked that, with regard to the regulations issued by the Local Government Board, there could be no difference of opinion. Anything more unlikely to create enthusiasm for town planning, and less likely to overcome the inertia that prevailed in local authorities when schemes of improvement were proposed it would pass the wit of man to devise. The Act in effect enabled a local authority to obtain powers for the improvement of its town without proceeding to Parliament. It would certainly be a gain to have inquiries

held in the locality instead of going to Westminster; but, apart from that, he thought authorities would be better advised to go to Parliament than to proceed under the Town Planning Act. He submitted that the procedure prescribed by the Act should be reversed, and that every local authority should be compelled to prepare a scheme unless it could show that it was not required. The Local Government Board had not the courage of its own convictions in these matters, and he had no hesitation in saying that the paucity of the applications received arose from the difficulties at the outset in putting the Act into operation.

Professor Adshead, Professor of Town Planning, Liverpool University, said he was one of those who believed that the problem of town planning rested with the municipal engineer in the first place. He felt he was the only official in whose hands was all the information—information regarding the intricate network of the city streets, the connections between city and suburb, and between city and adjacent city. The municipal engineer was also the first man among the various people interested in town planning to understand the proper allocation of areas for various purposes. That had an important bearing on town planning. He felt that this allocation of areas was the most important power that was being given under the Town Planning Act. In connexion with his school at Liverpool he felt that the engineering element in town planning must have the first consideration, but they, as a University school of town planning, had to take it in the broadest aspects. They had to consider the architectural side, the legal side, the landscape expert's side, and it was their endeavour to show those municipal engineers who sent students to them, a sort of vision of the whole problem.

Mr. E. G. Mawbey, Leicester, considered every municipal engineer should begin to make a true plan. He should not wait until his authority asked him. They ought to go forward with a bold policy. As to relaxation of by-laws, they were strong against that at Leicester. They wanted to make streets with grass margins, and they had come to an arrangement to make the streets 50 ft. wide instead of 40 ft., and let them have grass margins *pro tem*. That question of grass margins was a difficult one; if they had them they must have money for maintaining them.

Mr. Jenkins, Finchley, said he had been specially asked by his Council to bring before the Conference a question which they thought was very important. On the occasion of the National Conference at Liverpool they applied to the Local Government Board for permission to send a delegate. The reply was that delegates could only be sent at the expense of the local authority within a distance of 120 miles. With regard to this Conference, the reply was that they were only prepared to sanction payment of the expenses of delegates living in the neighbourhood of West Bromwich. Their Institution was not confined to the neighbourhood of West Bromwich, and the meeting was a national one, drawing officials from every part of the British Isles. They therefore felt that it would have been of great assistance to all authorities had permission been given for the payment of reasonable expenses.

Mr. Whyatt, Grimsby, said one of the points which would differ in different places was the value of the land. In some places, as at Ruislip, land was worth 50l. or 40l. per acre, but in some applications in which they might be concerned in Grimsby, if the scheme were allowed to go forward, the price per acre might be as much as 600l. or 700l. That made a great difference with regard to the number of houses to be allowed per acre. If they calculated that a working man would be able to pay 8d. or 9d. a week in ground rent, and he was able to have a plot of land on which was put about twelve houses to the acre. But if the land was worth four times as much, the workman could not afford to pay 32d. a week in ground rent, and there would have to be about forty houses to the acre in order not to overburden him.

Mr. A. J. Price, Lytham, often thought, as a native of the old city of Chester, it was a great pity that the method of having rows and arcades under the main part of the building in front of the shop windows was not more generally adopted. They could then get a footway under the upper rooms. He did not

agree with the suggestion of differential rating. When they were laying out new districts they were emptying properties in the town, and that was taking place all over the country. The people who migrated to the outskirts got better conditions there, and they should pay for them, not call on the ratepayers inside to do so.

Mr. Lacey, Oswestry, said, with regard to the housing question, it seemed to him that what was wanted was a modification of the law concerning air space. He would like to see smaller blocks; instead of twenty to have four or six houses in a block. The question of educating the young so as to make them good citizens might be almost regarded as a corollary to the Town Planning Act. Education should not be limited to the three R's; there was a fourth R—respect. He wanted the children to be taught respect for others and respect for other people's property, so that the rising generation who were growing up in much better conditions would know how to try and use those conditions as they should. He could say, from his experience, that infectious disease was at times less prevalent in what was called low-class property than in other parts of a town, showing that not insanitary conditions alone were responsible for it.

The vote of thanks to the authors of the papers was unanimously adopted.

Mr. J. A. Brodie, Liverpool, in acknowledging for the authors, said whenever he had contributed papers he had always found their criticism most useful and helpful to him. A word or two on one subject that was discussed—that of by-laws. They wanted to be a little careful about by-laws. They did not want to assume that by-laws were always right; in fact, they were sometimes capable of improvement. What they wanted to make sure was that the buildings they were getting under improved by-laws, if necessary, were buildings which would be as good after sixty years as now, or almost as good. They wanted to keep up the quality of their material, and also to have better forms of construction, which would do away with much that was objectionable.

CIVIC DESIGN NOTES.

Proposed New Bridge at Bristol.

BRISTOL, as well as London, seems to be in difficulties with its north and south traffic which involve the widening of a present bridge or the erection of a new one. The city authorities appear to have been contemplating the widening of Bristol Bridge, but a memorial from the Stoke's Croft, North-street, and District Ratepayers' Association has lately been presented to the Corporation, urging the advisability of the creation of a new bridge connecting Temple-street and Merchant-street. This was opposed by some of the members of the Corporation on the score of expense, the state of the city finances not permitting such a large expenditure. However, after some discussion it was referred to the New Streets Committee for consideration and report. It is all to the good that suggestions from outside should be received and be properly considered by the city authorities. Ideas from any quarter should always be welcome, and their courteous reception encourages a proper civic spirit among the citizens. A suggestion by a local resident for a bridge in a slightly different position which was published in the local press claims to provide equal facilities at less cost and disturbance of property.

A PROPOSAL WAS SUBMITTED LUDGATE-HILL at a meeting of the Corporation on the 27th ult., on behalf of the London, Chatham, and Dover Railway Company, to erect shops at the ground level with three floors above, on a portion of the site of the forecourt of Ludgate-hill Station in New Bridge-street, which is at present enclosed by railings. Under the scheme an area of about 296 yds. super. of land would be added to the public way. The company asked the Corporation to bear the cost of altering the pavements and reconstructing the gullies, estimated by the engineer at about 800l. The Corporation agreed to the scheme subject to the following conditions—(1) That the company should make adequate provision behind the proposed line of improvement for vehicles to enter or leave the station; and (2) that no claims should be made in respect of the proposed

buildings in the event of the Corporation's requiring to widen the public way.

A letter was read from the London County Council suggesting that, as the leases of the adjoining property on the south side of the station were about to expire, the question of an adequate street improvement, to which the London County Council might be prepared to contribute, ought to be considered.

The communication was referred to a committee.

We are interested to learn that the inhabitants of Westerham, Kent, take a just pride in the appearance of their town and its neighbourhood, and are alive to the necessity of taking active steps to preserve its charm and to resist any and every innovation that tends to destroy it. For this purpose a society is in process of formation, to be called the Westerham Local Society, pledged to uphold the architectural and antiquarian interests of the town, which, we hope, will include every object of natural beauty. We wish this society every success and hope that so admirable an example will be followed by every county town in England.

The Street of To-day and To-morrow.

In a recent paper on "The Street of To-day and To-morrow," read before the Institute of Municipal Engineers by Mr. G. W. Hayler, we are glad to see attention drawn to the fact that it can be shown that "to clothe in artistic form that which civilisation has made useful in the public life" is in the end financially profitable. In the past there was no doubt some excuse for the Anglo-Saxon view that art is a luxury. There have, perhaps, been periods during which architecture was thought to consist in features and ornament, many of them useless and all of them expensive, but in these days, when sounder views prevail and it is recognised that the art is in the lay-out of a building or of a town, and consists in the nice adjustment of means to an end, in form and proportion rather than in ornament, the public, we hope, will begin to realise that an artistically-arranged scheme may even prove to be the most economical.

We cannot, however, altogether follow Mr. Hayler in thinking that "a particularly objectionable proceeding which is frequently observed is the setting back of buildings in the centre of a block and the bringing forward of the two end buildings." It depends a good deal, we suppose, on how it is done; it does not necessarily follow that "the street line is spoiled." We see no harm in occasionally breaking up the horizontal line of too lengthy a street by a recess. The sketch we publish below shows a legitimate treatment which has the advantage of introducing groups of trees when otherwise they might be impossible.

THE feeling that "something must be done" with regard to Holyrood and the adjoining portions of the old Canongate suburb seems to persist. Sir Rowand Anderson, writing to the *Newsman* of July 10, associates himself with the opposition to Treasurer Leishman's proposal to build a new Palace to take the place of the old—a proposal that seems to involve the "tidying up" of the old property in the neighbourhood. To begin with, as Sir Rowand Anderson remarks, "No new Palace, however up-to-date, can be to the people of Scotland, from the King to the peasant, what Holyrood is" which is sufficiently plain. And his further objection, "If Holyrood is to be deserted for a new Palace, what is to become of the present building?" is not necessary to accentuate the general consciousness of the importance of Holyrood historically as a visual nucleus of right conceptions, and sociologically as an actual branch on the tree of the nation's life. It is strange that the matter should be left to the architects to the extent that it is. But when one comes to consider the small old houses round about it as a setting to the Palace, surrounding it with its right atmosphere, maintaining for it its just scale, and enhancing all its qualities through the channels of many associations of ideas, the civic architect is in a province entirely his own. We find ourselves in agreement with Sir Rowand Anderson in his view that the group of old houses on the north side, one of the most interesting remnants of Old Edinburgh, should be purchased and brought back to their original conditions. In conclusion, to quote from Sir Rowand Anderson's letter, "Let warning be

taken by what the Carnegie Trustees have done in Dunfermline. At the west end of the Abbey Church there remained up till very lately a picturesque group of old houses, one of the most interesting of the remnants of old Dunfermline. The houses here were quite capable of being renovated and made use of. In colour, grouping, and scale they added greatly to the appearance of the old Abbey, and toned beautifully with it. The entrance to Pittencrieff Dell has been robbed of much of its interest by their removal. All that the Trustees have had to offer in place of this is a large gable built of white firebrick, staring and discordant with all its surroundings. Let us hope Edinburgh will not be guilty of such a piece of vandalism."

The National Trust.

THE National Trust appeal for contributions wherewith to acquire, at a price of 200*l*, the Old Priest's House at Muchelney, co. Somerset, which constitutes an almost untouched example of XVth century domestic architecture. The fabric, of local blue stone, and faced with yellow Ham Hill stone, needs repair, which, it is stated, would be effected at the charges of the Society for the Protection of Ancient Buildings, if the structure is taken over by the National Trust. Two members—Dr. Jamieson Hurry, of Reading, and Mrs. Jamieson Hurry, have agreed to purchase from the Earl of Derby, at a price of 1,000*l*, for presentation to the Trust, 34 acres of Carter's Hill, near Sevenoaks—known as One Tree Hill—whereof the solitary beech-tree forms a conspicuous landmark, and which affords a fine prospect extending from Crowborough and Ashdown Forest to the heights of Dover. The Trust seek to raise 300*l*. wherewith to purchase the chapel of the Chantry of SS. John the Baptist and Thomas à Becket, founded in Buckingham by Archdeacon Stratton in 1268. The chapel subsequently became the schoolroom of Edward VI.'s Grammar School. The original entrance, a Norman arched doorway, has been preserved. Mr. Ingham Whitaker, of Grayshott Hall, has presented to the Trust the strip of frontage, 20 acres, that lies between the high road from Grayshott to Headley and Ludshott Common, which is one of the thirty-five properties now belonging to them.

Recessed Frontages in Highways.

THE BUILDING TRADE.

SOME LEGAL QUESTIONS ABOUT EXTRAS.

IT is not too much to say that most of the disputes which arise between builder and building owner involve the discussion of the question: Who is liable to pay for extras? The building owner wants to have his work carried out for a sum certain in money. The man who has decided to build a house for 3,000*l.* does not like to have to pay 3,500*l.* The builder, employed by him, who has tendered for the work at 3,000*l.* has probably, under the stress of competition, cut his figures rather fine, and cannot afford to do extra work without extra remuneration. Acting as intermediary between the two, the architect has to try to please both. For his own credit's sake he wants to finish the work in the best possible style and he may, therefore, be tempted to use such authority as he has in the matter of extras to enable the builder to execute the many little improvements which suggest themselves while the building is going forward. It will be said, of course, Why should not these things be all worked out beforehand? But it is easy to be wise after the event.

The broad legal principle which underlies every contract for the erection of buildings is easy to understand and easy to enunciate. If a builder agrees to erect a certain number of houses of certain materials for 1,000*l.* he can be compelled to carry it out to the letter. If he finds that he has to spend 1,500*l.* to do the specified work, that is his misfortune. On the contrary, if there is a sudden fall in prices which enables him to do it for 500*l.*, that is his gain and the employer's loss. In the simple case suggested, the question whether any particular piece of work or the use of a certain kind of material was something *dehors* the contract might have to be settled in a court of law. For convenience and simplicity, however, the plan has been devised of leaving the question, "Extra or not?" to the decision of the architect, and the customary forms of contract make elaborate provision for the methods by which extras shall be ordered and paid for.

It is proposed in the present article to consider some of the points which arise in relation to extras—even when the contract is in the most approved form—the form, for instance, which has been sanctioned by the Royal Institute of British Architects.

Clause 12 of that contract provides that: "The contractor shall, when authorised by the architect, or as provided by Clause 5, vary by way of extra or omission from the drawings or specification; such authorisation is to be sufficiently proved by any writing or drawing signed by the architect or any subsequent written approval by him, but the contractor shall make no variation without such authorisation. No claim for an extra shall be allowed unless it shall have been executed under the provisions of Clause 5, or by the authority of the architect as herein mentioned. Any such extra is hereinafter referred to as an authorised extra."

The Clause 5 which is referred to in this clause is that which provides that the contractor must make such variations as may be necessary in order to comply with local by-laws, etc. Before making such variations he must obtain the sanction of the architect.

As regards other variations "by way of extras and omissions" it is clear that Clause 12 imposes a duty upon the contractor to make them when the architect tells him to do so. In the exercise of the power so conferred the architect might easily deprive the contractor of a very profitable piece of

work by telling him to omit it; or he might direct the execution of a very large amount of work. This clause makes it plain that no extra or omission shall be considered unless sanctioned by the architect in writing.

Elaborate provision is made by Clause 13 of the same contract for ascertaining the price of extras. The clause provides that:—

"No variation shall vitiate the contract; but all authorised extras for which a price may not have been previously agreed, and any omission which may have been made with the knowledge of the architect, or without his knowledge, provided he subsequently give a written sanction to such omission shall be measured and valued, as hereinafter provided, by (the architect or surveyor); and a copy of the bill or statement of such measurement and valuation shall be given to the contractor. The fees for so measuring and valuing the variations shall be added to the contract sum. If in the opinion of the architect the work cannot be properly measured and valued, day work prices shall be added therefor, provided that vouchers specifying the time and materials shall have been delivered for verification to the architect, or his nominee, at or before the expiration of the week following that in which such work shall have been done. The valuation shall be valued at the rates contained in the priced bills of quantities, or, where the same may not apply, at rates proportionate to the prices therein contained. The amount to be allowed on either side in respect of the variations so ascertained shall be added to or deducted from the contract sum as the case may be.

It will be seen by this clause the builder submits himself entirely to the judgment of the architect—subject, however, to the right of the builder to have the matter referred to arbitration in accordance with a subsequent clause in the agreement.

Much importance attaches to the power which the clause above referred to (Clause 12) gives to the architect to vary the works, especially having regard to a case decided in the Court of Appeal last year, which, owing to the fact that it is not reported in the "Law Reports," is not very generally known. It was formerly held that the power to order extras gave no power to vary the design of the work. This was the result of the case of *R. v. Peto* (1826), 1 *X. & J.* 426). Dealing with the "extras" clause in that case, Alexander, C.B., said: "Everyone who is at all conversant with building knows that, in the course of building, it occurs sometimes to add and sometimes to desire that certain things may be omitted; this appears to have been in the contemplation of those who prepared this instrument; and accordingly they have introduced that clause, which was clearly inserted to prevent in the first place any such direction affecting the rest of the contract, and in the next place to provide for the manner in which the contractor was to be paid in case that event should happen. After reading the clause, he said: 'Is it possible that this clause was intended to give to the surveyor, a person who ought to be in general but an overlooker of the owner, to see that the work is accurately performed, a power to vary the whole scheme of the building; or if it were so intended, that it could have been expressed in such language? In sound construction it should be limited to that to which the condition has confined it, namely, to such extra works as may be done, or something which is to be omitted; but it cannot refer to the substitution of one thing for another, more especially anything so important as the making the foundation on which the whole validity and security of the building depends.'"

In *Stephens v. Mewes* (Court of Appeal, June 7, 1910) the plaintiff had contracted with a firm of builders, who were erecting a building, to sink an artesian well to supply this building with water. Under his contract the plaintiff was to sink the well to a depth of 550 ft., but when the work was being carried out the boring tube broke at a considerable depth below the surface. It was found impossible, but fortunately it was unnecessary, to continue the boring, for by means of an air lift pump sufficient water could be raised. The use of an air lift pump being decided upon by the building owners, an order was given to the plaintiff by the defendants, who were architects to the builders, to put in the air lift pump. Having so put it in, he sought to make the architects personally liable on the contract, but it was held that he could not do so. Dealing with the case of *R. v. Peto* (*supra*), Lord Justice Fletcher Moulton pointed out that in that case there was no power to vary or alter, but there was only a power to direct extra work and direct omissions. Accordingly the judges in that case said that the finding of the jury that the clerk of the works directed the builders to vary the piling was not in accordance with the strict language of the bond.

Lord Justice Fletcher Moulton then said: "It was based on the fact that the word 'vary' was not there. If the word 'vary' had been there, the alterations in the mode of piling would probably have been covered by it, but they (the court) said, 'You have neither proved authority, because it is not within the condition of the bond, nor have you even averred that the variation was in the nature of an addition or omission so as to bring it within the meaning of the language of the bond.' Therefore, I cannot see what other conclusion they could have come to. They decided that, *non obstante veredicto*, the Crown were entitled to succeed. It was a decision certainly that in the absence of the word 'vary' you must prove that this change may be fairly considered to be an addition or an omission, and if you cannot do that you fail, but it is no decision as to what the powers of an architect are when there is an express power to vary. Now I quite agree that 'vary' means not so as to destroy the scheme of the whole thing, but, in my opinion, to substitute for one well-known piece of machinery an equivalent, equally well known, doing exactly the same work—certainly a different one, just in the same way as if you ordered a Dean pump and then you made up your mind subsequently to use a different pump. In my opinion, I am satisfied that this is within the language of the word 'vary,' and I am still further satisfied that the case of *Rex v. Peto* has nothing whatever to do with this case, and I think I may say has nothing to do with any modern contract of this kind in which a power to vary is almost always expressly given." (The above extract from the judgment is taken from the shorthand note which is in the writer's possession.)

In the light of this judgment it becomes a nice question how far an architect has power to bind the building owner by making alteration in the materials to be used in the construction of a building. It is a general rule that an architect cannot order extras without authority. In other words, the cost of extras done pursuant to an order which an architect has not authority to give cannot be recovered from the employer. For instance, in *Cooper v. Langdon* (1841, *M. & W.* 60) a builder was sued for not building a house in accordance with his contract. He pleaded that he deviated from the drawings, etc., by the direction of the architect. It was held that this was no

answer to the claim, as it was not proved that the architect had power, under the terms of the contract, to bind the employer by allowing deviations from the drawings.

Again, in the case of *Betts v. Piekfords* (1905, 2 Ch. 87) it was held that an architect who was employed to superintend the building of a house in accordance with approved plans has no implied authority to allow adjoining owners to build the projecting ends of their stanchions and roof beams into the wall of the house.

Questions as to the authority of the architect may be settled by a suitable clause in an agreement between the architect and the building owner. Thus in one form which is sometimes used it is provided that: "The said architect will be at liberty to vary architectural details provided such variations do not involve extra cost, but shall on no account incur any increased expenditure without the sanction of the said employer in writing."

Under well-known principles of the law of agency the architect may render himself personally liable for the value of extra work executed by the builder, if he expressly or impliedly, without having such power, represents to the builder that he has the authority of the employer to order such work—*Randall v. Trimen* (18 C. B. 786).

In a recent Scotch case (*Robertson v. Jarvie* (45 S. L. R. 280) a question arose as to the authority of an architect to order extras. It appeared that the plaintiff offered to do certain work for the defendant for a lump sum. The schedule annexed to the plaintiff's estimate provided (*inter alia*) that "the work to be done . . . to the entire satisfaction of the proprietor or architect, who will be at liberty to make alterations, and to increase, lessen, or omit any part of the work . . ." The defendant accepted the offer, and on completion of the work the architect certified that the plaintiff was entitled to a sum, which, owing to extras, exceeded the lump sum. In an action brought to recover the balance the plaintiff averred that the extra work had all been authorised by the defendant's architect, and that his certificate was final. In his defence the defendant denied that the extra work had been authorised by his architect, and said that his architect had no power at his own hand to authorise it, and that the whole work executed did not, in many respects, comply with the contract. It was held that, as the architect was not by the contract made an arbitrator, there must be an inquiry as to the question whether the additions and alterations had all been authorised by the architect. It was held, further, that, assuming that fact to be proved, the defendant could not at least, in the absence of very specific arrangements, object to the architect's final certificate, he having been allowed to act as measurer. Lord McLaren gave utterance to the following dictum: "I think that there can be no doubt that within the scope of his employment, an architect is the proprietor's agent; and if the building contract provides that the work is to be done to the satisfaction of the architect, then any order within the scope of the contract which the architect may give is a sufficient authority to the tradesman to execute the work, because he is entitled to take the order of the agent as equivalent to the order of the principal." Applying the principle of this case to the position of a consulting engineer, it would seem that, if he has any discretion to increase the amount of work set out in the specification, he may render his employer liable.

It stands to reason that where the contract expressly provides that extras shall be authorised in writing the contract must be strictly adhered to. So where a clause stipulates that for all extra work written directions shall be given by the architect; a sketch made by the architect, and not signed by him, is not such a direction as complies with the contract, nor are the mere oral directions of the employer to do some

increased work, in the absence of proof of a new contract.

But it should be borne in mind that the extra work ordered may not be an addition within the meaning of the original contract, but may be entirely *dehors* the same, amounting to a new contract; in which case a written order would not be necessary to entitle the builder to maintain an action for the work.

It remains to consider the not uncommon case of an employer or building owner himself intervening to order extras. He appears on the job, sees something which does not please him, and directs the builder to alter it. If it is alleged that the order was given by the employer, the contractor, suing for work extra, the original contract must not only put in that contract, if in writing, but also prove a separate and distinct one with the employer to do the work sued for. If the builder has done extra work without any authority from the employer the latter will not be bound to pay for it.

The mere fact of the employer having assented to certain alterations is not sufficient to make him liable to pay for them as extras, unless he is either expressly informed, or must necessarily, from the nature of the work, be aware that the alterations will increase the cost. But where it was shown that in the progress of building some process more expensive than that contracted for was ordered by the architect, with the knowledge of the employer, who was present at the time, and the builder's sub-contractor was told that it was to be charged as additional work, it was considered that there was sufficient evidence of a contract to pay the builder extra for it, and of authority in the architect to make such a contract with him.

BUILDING PLANS AND BUILDING PROSPECTS.

THE returns obtained from certain local authorities as to the building plans approved by them have been used from time to time by responsible members of the Government as showing that recent legislation has not handicapped the building trade and as indicating improved conditions. In view of this contention the latest returns published in the Board of Trade Labour Gazette have some significance. The second quarter of 1911, as compared with the second quarter of 1910, shows a decrease in money of 356,143*l.*, or 8·2 per cent., and this decrease is practically confined to dwelling-houses. The Chancellor of the Exchequer claimed for the new taxation that it would bring land into the market and foster building enterprise. The land has come into the market, but these figures show that building enterprise has not been stimulated, and in view of the uncertainty attaching to the valuation of house property for the purpose of collecting increment value duty it is not to be wondered at that the public are chary of investing in a form of property subject to arbitrary and uncertain taxation. The land dealt in has been agricultural land, which is not subject to the same onerous conditions as building land. The decrease in building plans is most marked in Outer London, where the decrease amounted to 36·3 per cent., and in this district the decrease is not confined to dwelling-houses, but is shown in every class of building—factories, shops, churches, schools, etc., the only head showing any increase being classified under "other buildings, additions, and alterations." In such a district it may be assumed that all land and buildings are subject to increment, and this falling-off in building activity is not without significance. We have always maintained that taxation of buildings, if imposed at all, should be imposed with some reference to actual values which can be ascertained and checked by ordinary business men on business principles. The present basis of site value and the chimerical increment value deduced therefrom offend against all the principles of sound taxation, and the building trade must increasingly feel the effects of arbitrary taxation.

LONDON ASSOCIATION OF MASTER STONEMASONS.

THE London Association of Master Stonemasons held their first annual outing on Wednesday, the 19th ult., and were the guests of the Bath Stone Firms, Ltd., and the Yockney and Hartham Park Stone Company, Ltd. Arriving at Bradford-on-Avon, they inspected the old Saxon church, which dates from the year 680, and is considered the finest and best-preserved church in the country of that period. Afterwards, the more modern one, dating from 1166, was inspected. Kingston House was also visited by permission of Mr. I. Moulton, J.P., C.C. The house, which is said to be the finest specimen of Jacobean architecture in the country, was built in 1590, faced with ground stone, and it is a good object-lesson in durability.

At Farleigh Castle the Old Chapel and relics were seen, and the party then returned through Combe Down to Bath, where various buildings were visited. At the Pump Room, Mr. Silcock, the Mayor of Bath, welcomed the party, and said that from Bath came a large amount of the stone which was used by the London master stonemasons. Mr. Carben, the President, thanked the Mayor on behalf of the visitors; Mr. Stephen Collins, M.P., Vice-President (himself a master mason) seconded the vote.

Mr. Courtney, J.P., then proposed a vote of thanks on behalf of the members to the Bath Stone Firms, Ltd., and Yockney and Hartham Park Stone Company, Ltd., for their hospitality, and for the very enjoyable day they had all spent; Mr. Frank Morimer seconded the resolution, Mr. Cotterell and Mr. Lucas responding for their respective firms. Mr. Cotterell conducted the company around the old Roman baths, explaining to them the history of Bath.

A vote of thanks was passed to Mr. Cotterell for his explanation, and a vote of thanks and regret was next passed to Mr. Walpole Collins, the Hon. Secretary, who was absent owing to illness.

NATIONAL FEDERATION OF BUILDING TRADES EMPLOYERS.

A HALF-YEARLY general meeting of the National Federation of Building Trades Employers of Great Britain and Ireland was held on the 26th ult., in the King's Hall of Armstrong College, Newcastle. Mr. J. W. White (Sunderland), the President of the Federation, was in the chair, and there was a large attendance of members of the Council and of the Northern Counties Federation.

The Secretary (Mr. A. G. White) reported that the Council on the previous day had considered Federation finance, and had referred the matter back for further consideration, with the rider that the Federation should be debited with 50 per cent. reduction of the contribution to the reserve fund for this year only.

Mr. Blackburn (Newport) spoke of the labour troubles in South Wales, where 50,000 miners were out, and where the seamen's strike had practically stopped the building trade. The effect of the Council's decision was to reduce the contributions to the reserve fund from 6*d.* to 4*d.*, a resolution to which he was opposed. They had nothing with which to assist, say, the builders in South Wales, and he urged they should not be mean in their contributions, but should have money at their backs in the bank.

The Council's recommendation was adopted. The Secretary read the Council's interim report, which stated that the official relations with the operatives were satisfactory, although there had been, in some districts, indication of unrest and revolt against trade union leadership, and it was probable that the conciliation scheme would be severely tested. It was necessary that the employers' organisation should be ready for any eventuality. Trade continued to improve slowly, but in many districts there were complaints of a dearth of business.

Mr. Jas. Wright (Nottingham), Vice-President, alluded to the statement in the report that the conciliation scheme was likely to be severely tested. He believed that would be so, especially if trade improved, as they hoped it would. In Nottingham, for instance, the joiners, who had got an advance of wages through the medium of the conciliation scheme, were sympathetic to men who were on strike, and were not represented on the Conciliation Board. He urged the local associations to be ready for any emergencies that might arise.

Mr. S. Smethurst (Oldham) believed that the trouble at Nottingham would be away. Alderman W. H. Jessop (Huddersfield) moved, and Mr. Richard Heslop (Newcastle) seconded, that, in view of the importance of the report it be printed and circulated among the local associations by the Federation.

Reports were presented on the National Insurance Bill, and the President said the Council's recommendation was that a deputation from the Federation and allied trades in building should ask the Chancellor of the Exchequer and the President of the Board of Trade to receive a deputation to consider certain aspects of the Bill which had an important bearing on the building trade. On the motion of Mr. Carl (Rochdale) it was agreed to ask the Chancellor of the Exchequer and the President of the Board of Trade to receive a deputation.

Mr. Davidson (Leeds) moved the following resolution:—

"That this Conference of representatives of the National Federation of Building Trades Employers of Great Britain and Ireland, and the Allied National Association of the Painter, Slatting, Plastering, and Plumbing Trades regard with grave concern the many serious liabilities proposed to be imposed upon building trade employers by the National Insurance Bill, and strongly protests against its being applied to the building trade at the present time, and before any relief has been granted in respect of the heavy and ever-increasing cost of workmen's compensation insurance, and asks that the building trade be exempted from the operation of the proposed National Insurance Scheme, either entirely or for a period of at least three years, and that, meanwhile, an inquiry into the working of the Workmen's Compensation Acts be undertaken with a view to the passing of a remedial Act next year."

Discussion followed, and it was strongly urged that the builders from one end of the country to the other should voice their objection against the Bill. Several speakers thought that the exemption period of three years should be struck out of the resolution. Councillor Stephen Easton (Newcastle) suggested that there should be included in the Bill, workmen's compensation due to accidents not caused by the negligence of the employer.

Mr. W. Shepherd (London) thought it was a mistake to introduce any question about interfering with the Workmen's Compensation Act while the Insurance Bill was under consideration. He believed the latter would eliminate the benefit thrift societies of the country, and he was astonished that thinking people should give support to the scheme.

On a vote being taken an amendment to delete the words three years as the period of exemption was lost.

Mr. W. H. Hope (Sunderland), Secretary of the Northern Counties Federation, moved another amendment, as follows:—

"That this meeting of the National Federation of Building Trade Employers recognises the many grave defects in the National Insurance Bill, and the necessity for fullest investigation and necessary amendment, and while satisfied that the effect will mainly fall upon the employers, even if the cost is shared by the building owners, leaves the matter to the conference to put forward their case, with the object of amending the Bill on the basis recommended."

The amendment was carried almost unanimously, and the original proposition was therefore negatived.

GENERAL BUILDING NEWS.

PARISH CHURCH, BEDLINGTON.

Mr. A. B. Plummer, of Newcastle, is the architect for the improvements which are being carried out at this church. Messrs. R. & G. Brown, of Amble, are the builders, and the cost of the work is about 3,000l.

JOHN KNOX PARISH CHURCH, ABERDEEN.

Messrs. Wilson & Walker are the architects for this church, which is being erected at a cost of about 7,000l. The contractors are:—Mason, Messrs. Findlay & Henderson; carpenters, Messrs. Leslie & Hay; slaters, Messrs. Archibald & Leslie; plasterer, Mr. William Masson; plumber, Mr. John Worling; painters, Messrs. Gordon & Watt; heating, Messrs. Mackenzie & Moncur, Ltd.; electric work, The Aberdeen Electric Engineering Company.

KING'S COLLEGE, ABERDEEN.

Extensive additions are to be carried out at this college at an estimated cost of 10,000l. The architect for the work is Mr. A. Marshall Mackenzie, A.R.S.A., of Aberdeen, and it is expected that the buildings will be completed in October of next year.

NEW TRAINING COLLEGE, SWANSEA.

This building is being erected at an estimated cost of 40,000l., and will provide accommodation for about 200 students. The architect is Mr. G. E. T. Laurence, A.R.I.B.A., and the contractors are Messrs. Lloyd Bros.

NEW TOWN HALL AND PAVILION, TORQUAY.

The erection of the Town Hall is being carried out at a cost of about 28,869l., and the architect is Mr. Thomas Davison, of London. The builders are Messrs. Wilkins & Sons, of Bristol. The pavilion is being erected from the designs of Mr. H. A. Garratt, the Borough Engineer, and the contractor is Mr. Narracott, of Torquay, the contract price being 16,942l.

TOWN HALL, HAMPSHIRE.

The Mayor of Hampshire, last week, laid the foundation-stones of the extensions to the Town Hall, which are being carried out at a cost of 18,500l., including the site. The architect is Mr. John Murray.

NEW OPERA HOUSE, KINGSWAY, W.C.

The work of erecting this building was commenced in November last, and it is expected that it will be finished and opened in November next. The architect for the work is Mr. B. Crew.

NEW COUNCIL OFFICES, NEWBURN.

These offices have been erected from the designs of Mr. Edward Cratney, architect, and the contractor was Mr. Thos. Clements, of Newcastle. The electric installation is by Messrs. Robson & Coleman, Newcastle, and the carrying by Mr. G. Hughes, also of Newcastle.

TRADE NEWS.

The "Boyle" system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to Fitzalan-street Church, Glossop. Under the direction of Mr. W. M. Scott, architect, Lindlithgow, the firm's system of ventilation (natural), embracing Boyle's latest patent "air-pump" ventilators and air inlets, has been applied to Bridgend School.

The Beckett Hospital, Barnsley, is being supplied with Shorland's double-fronted patent Manchester stoves, with descending smoke flues and patent Manchester grates, by Messrs. E. H. Shorland & Brother, Ltd., of Falsworth, Manchester. The Aberdare County School is being supplied with the firm's warm air ventilating Manchester grates.

In reference to the restoration of Lympne Castle and the knighthood conferred on Mr. R. S. Lorimer, the architect, we are asked to state that the whole of the restorations and additions were in the Chilmark stone of Messrs. T. T. Gething & Co., Ltd., London, and carried out by them. Messrs. Gething had a large staff of masons upon the site, and the work, being chiselled work, so as to be in character with the old work, was carried out upon the site at the desire of Sir R. S. Lorimer.

ACCIDENT AT CHELSEA.

An accident occurred in Bramerton-street, Chelsea, on Monday evening last, caused by the collapse of about 180 ft. of solid stone and brick coping from the front of nine houses. These houses are four stories high, and the coping was about forty or fifty feet from the ground. The greater part of the small balconies over doorways and windows were carried away, and the railing in front of the houses was completely demolished. Fortunately there were no serious results.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 TO 1909.

At Tuesday's meeting of the London County Council the following applications under the London Building Acts were dealt with (the names of the applicants are given in parentheses).

Lines of Frontage, Projections, and Construction.

Islington, North.—An iron and glass shelter in front of the proposed entrance to Highgate-railway-station, Highgate-hill, Islington (Mr. W. E. Mandelick for London Electric Railway Co.).—Consent.

Rotherhithe.—Three wooden notice boards of a temporary character in front of Nos. 46 and 48, Lower-road, Rotherhithe (Mr. S. J. H. Stuart for the trustees of the Rotherhithe Great Hall).—Consent.

Width of Way, Lines of Frontage, and Construction.

Hampstead.—Temporary building at No. 1a, Greville-place, Hampstead (Mr. F. T. Verity).—Consent.

Holborn.—Iron and glass shelter on the eastern side of Fulwood-street, at the Chancery-lane tube railway station (Messrs. John Leaning & Sons for Mr. H. J. Leaning).—Consent.

Space at Rear and Projections.

Southwark, Wist.—Building on the north-eastern side of Green-street, Southwark, between Ripley-buildings and St. Alphege Paris Hall, with an irregular open space about such building and with a projecting hood over the entrance doorway in Green-street (Mr. J. G. P. Meadon for Mr. W. J. Tapper).—Consent.

Space at Rear.

Chelsea.—Conversion of No. 214, Pavilion-road, Chelsea, into a domestic building (Mr. J. Hudson).—Consent.

Hammersmith.—Building at the rear of No. 300, Latimer-road, Hammersmith (Horsman, Ltd.).—Consent.

Kensington, North.—Addition at the rear of No. 11, Lansdowne-road, Kensington (Mr. E. W. Marshall for Mr. E. Davis).—Consent.

Wednesbury.—Institute; Mr. G. Balfour, Secretary, Education Committee, Staffs County Council, Stafford.

West Dean (Gloucestershire).—School (4,000l.); Mr. R. S. Phillips, The Cross, Gloucester.

Wheatley.—Additions and alterations to St. Mary's Church; the Vicar.

* See also our list of Competitions, Contracts, etc., on another page.

WESTMINSTER CITY COUNCIL.

At the usual fortnightly meeting of the Westminster City Council on July 27, the following, among other matters, were dealt with:—

Painting and Repair Work.—It was agreed to expend 388*l.* on painting and repairing work at City Hall, and 298*l.* on painting and pointing work at Caxton Hall. It was also agreed to expend an additional 138*l.* 10*s.* in making good the stonework at the latter hall. Messrs. Love & Co., of 35, Exeter-street, were entrusted with the work at the City Hall; the tender of Wright & Son, 27, Wild-street, Drury-lane, was accepted for the painting and pointing work at Caxton Hall, and that of the Stone Preservation Company for making good the stonework.

Replacement of Street Refuges.—The Works Committee, reporting on the question of replacing the street refuges removed for the Coronation Processions, state that they received a letter from the Commissioner of Police asking that the work might be deferred until he had had an opportunity of considering the suitability of the positions. The Commissioner had since sent another letter, in which he stated that he thought the majority of the refuges should be replaced as soon as possible, and suggesting six other refuges:—

(a) Piccadilly, necessity for two refuges in front of Devonshire House. (b) Pall Mall, south east corner of St. James's-street; temporary refuges. (c) Pall Mall East, south-east corner of Haymarket; permanent refuge in place of temporary one. (d) Strand from Adelaide-street. (e) Charing Cross, one or more refuges in vicinity of Drummonds Bank and Admiralty Arch. (f) Park-lane near Grosvenor Gate.

The work of reinstating the removed refuges and lamps was being proceeded with. The Council have informed the Commissioner of Police that they favour his suggestions with regard to the erection of refuges in the six positions above referred to, (a), (d), and (e) of which will be in place of refuges removed for the Coronation processions, and have asked him to furnish plans of the exact sites proposed.

METROPOLITAN WATER BOARD.

At the last meeting of the Metropolitan Water Board before the recess, on Friday last, on the recommendation of the General Purposes Committee it was agreed to employ the tender of Messrs. Johnson & Co., for 345*l.* to redecorate the Board's premises at Savoy House.

A New Tunnel under the Thames.—In order to safeguard the supplies of the western district of London, it was agreed, on the recommendation of the Works and Stores Committee, to approve of an estimated expenditure of 32,000*l.* in the construction of a tunnel under the River Thames, between Twickenham and Richmond. Advertisements are to be issued inviting tenders for the work. It is not anticipated that it will be necessary to use compressed air in constructing the tunnel, as the position chosen should ensure the whole length being below the surface of the London clay. It may, however, be necessary to drive a portion of the tunnel under compressed air owing, perhaps, to an unforeseen local scour in the ancient bed of the river, and in this event the prices for variations in the work comprised in the contract will be agreed between the Engineer and the contractor, or, failing agreement, be decided by arbitration.

MIDDLESEX COUNTY COUNCIL.

At the meeting of the Middlesex County Council on July 27, the Asylums Committee reported that in view of the number of married attendants at the Napsbury Asylum, and the increasing applications from single attendants desirous of obtaining permission to marry, they have come to the conclusion that steps should now be taken to provide twelve additional cottages there for married attendants. This was the more important owing to the scarcity of cottages in the neighbourhood of the asylum. The Committee also stated that they do not think it necessary to engage the services of an architect for this purpose, and they accordingly had plans prepared by Mr. C. J. Iles, who was principal clerk of works during the construction of the Asylum. The Committee expressed the intention of erecting six cottages as soon as possible, leaving the remaining six till a later date. The houses are to be built in blocks of three each, to contain five rooms and scullery. The total estimated cost is put at 3,003*l.* and

a recommendation from the Committee to the effect that they be authorised to enter into contracts for the erection of cottages was agreed to. The County Engineer and Surveyor has been instructed to obtain tenders for the formation of tar-paved and kerbed footpaths on the east side of Cowley (main) road, Viewless, between Philpots-bridge and Maygood's Farm, at a cost not to exceed 650*l.*, also on the north side of the Bath (main) road, Longford, between the "Peggy Redford" public-house and King's-bridge, at a cost not to exceed 365*l.*

The tender of Messrs. Wimpey & Co., at 304*l.*, has been accepted for the formation of a footpath on the west side of Edgware (main) road, Edgware, between Hendon Union Work-house and a point 450 ft. in a southerly direction. Plans of the proposed Council School in Highfield-row, Winchmore-hill, to accommodate about 1,200 scholars, have been approved. The Education Committee have been authorised to obtain tenders for the erection, in the first instance, for one department providing accommodation for about 400 scholars. Plans have also been approved of the proposed enlargement of the Holly-road Council School, Friern Barnet, to accommodate 800 scholars, and tenders are to be obtained for the re-erection at present of only one department, providing accommodation for about 400. The tender submitted by Messrs. W. Lawrence & Son, Finsbury-circus, E.C., amounting to 1,622*l.*, has been accepted for altering and enlarging the Edgware Council School.

LEGAL COLUMN.

Water Communication Pipes and Fittings.

The case of *Batt v. Metropolitan Water Board*, upon which we commented in our issue for March 10, has now been carried to the Court of Appeal, and the decision there delivered is of the greatest importance to householders.

A lady had caught her foot in a water stop-cock case, and sued the defendants for damages. Section 8 of the Metropolitan Water Board (Charges) Act, 1907, compels the Water Board to furnish the owner or occupier of any house in the district with a sufficient supply of water for domestic purposes, "by means of a communication pipe and other necessary and proper apparatus to be provided and laid down and maintained by him." The County Court Judge had held this Act to be retrospective, and to apply to existing fittings, and that, therefore, the owner or occupier of the house would be liable for any defect, and not the Water Board. The Divisional Court reversed this decision, holding the Act, not to be retrospective, and that the Board was, by decided cases, liable to repair those connections existing before the Act came into force. The Court of Appeal have overruled this decision, holding the Act to apply to all existing fittings. Lord Justice Vaughan Williams came to this conclusion with some hesitation, as he believed the former legislation proceeded on the principle that the liability of the owner or occupier was limited to pipes and fittings on or about the premises; but he was constrained by the general words used in Section 8 of the Act of 1907, "necessary and proper appliances," to abandon any such limitation, and the result of the decision is that the Metropolitan Water Board (Charges) Act, 1907, by this Section, and by conferring powers on householders to bank up the highway for the purpose of repairing communication pipes, Section 19, has transferred the whole liability for their maintenance to the owner or occupier of the houses.

This decision is highly unsatisfactory, as the water charges are higher than they used to be, and yet the Water Board is relieved from liability in respect of the necessary connections in public highways. Modern municipal legislation proceeds too much in the direction of imposing liability on private shoulders, and the ratepayers are reminded of the old saying that if you keep a dog they should not be expected to bark themselves.

LAW REPORTS.

CHANCERY DIVISION (Mr. Justice Eve.)

Rights under the London Building Act. Carden v. Layton.

THIS case again came before the Court on motion by the plaintiffs, the Trustees of William Carden, deceased, the freeholder, to restrain the defendant, a builder, from thickening and underpinning a party wall on

the south side of the plaintiffs' premises, 19, Goswell-road. As the parties were unable to agree on a settlement, or an order, the motion had to be fought out.

Mr. Clayton, K.C. (with him Mr. Corzens-Hardy), said he complained that the defendant had interfered with the plaintiffs' party wall, in defiance of the London Building Act, and had gone on building in defiance of a verbal undertaking, on May 23 not to do so. He asked that the defendant should be ordered to pull down such part of the wall as the report of Sir Alexander Stenning (referred to in our report in our last week's issue) found ought to be pulled down.

On May 19 last the plaintiffs' surveyor discovered that the plaintiffs' party wall was being underpinned and thickened, and no party wall notice had been given under Section 90 of the London Building Act. Such a notice was, however, given on May 22, when the defendants' wall had reached a height of 8 ft. 6 in. above the pavement. By June 6 the wall had reached a height of 27 ft. 6 in. On June 13, in a letter to the plaintiffs' solicitors, the defendant said that the wall was not a party wall, but an independent one. He had inserted a girder into the party wall, and there was a space of some inches between the old wall and the new one. Counsel then read the orders previously made and the report of Sir Alexander Stenning, and submitted that the report was binding on the parties.

The affidavit of Mr. H. B. Hale, plaintiffs' surveyor, showed that the wall was in fact a party wall, and that the defendant had built, in places into the party wall, to a height of 19 ft. (above the 8 ft. 6 in. to that had been built on May 22), without the plaintiffs' consent. Some of the bricks were let into the old wall.

The affidavit of Mr. Searlwood, defendant's surveyor, stated that the top portion of the wall had not been touched since May 22, when the undertaking was given. Since that date, however, the defendant had built an independent wall, which was not bonded into the party wall.

The defendant admitted in his affidavit that no party wall notice had been given by him to the plaintiffs owing to a misapprehension. He claimed that he had built an independent wall which was not bonded into the party wall, and he denied that a girder had been let into the wall. What had been done was to insert a ledger for the temporary purpose of scaffolding.

The wall complied with the London Building Act, and had been passed by the surveyor.

Mr. Justice Eve asked what was the practical result? The Court would not order the wall to be pulled down merely because the defendant had behaved badly.

Mr. Clayton said that Sir Alexander Stenning's report said that part of the wall ought to be pulled down, because it was not properly bonded.

Mr. Justice Eve said he wanted to put matters right without placing too great a burden on the defendant.

Mr. Lawrence, K.C., for the defendant, said that there was no common law right in the plaintiffs in this case, which was governed by the Building Act. The defendant had built under the supervision of the district building surveyor, who was the only person under the Act whom he was bound to satisfy. He was willing to bond the new wall into the old one, so as to satisfy the district surveyor under the London Building Act. The award made by the surveyors under the Act found that certain things ought to be done, and the defendant would, of course, comply with these directions, particularly with regard to bonding the wall, which could be done without pulling down.

Mr. Justice Eve: You are going to use the party wall as part of a new wall? Mr. Lawrence admitted that was so, but contended that under the London Building Act the defendant had a right to do that after he gave the notice. He contended that Sir Alexander Stenning's report went beyond what was left to him to decide, and he asked the Court not to interfere on an interlocutory proceeding.

In giving judgment, Mr. Justice Eve said that in view of the conflict of evidence he would proceed on the footing that Mr. Hale, the plaintiffs' surveyor, never took upon himself any authority to give the defendant permission to proceed with the work after May 22. It was proved that by June 6 the defendant had raised his wall to a further height of 19 ft. His Lordship said he saw that it was not possible to try the matter on an interlocutory application, and that the first thing to determine was whether the new portion was an independent wall or in the nature of an addition to the party structure, and when the motion first came on it was suggested that the question should be answered by an independent surveyor, and Sir Alexander Stenning was appointed to report

whether the work already done had been done properly and in accordance with the London Building Act. He reported that work done up to May 23 was right, but that the other was not, inasmuch as it was not properly bonded into the party wall. Sir Alexander looked upon it as an attempt to erect a statutory wall under the Act, of an insufficient thickness, and it was therefore an attempt which failed, and resulted in the new structure being a party wall. Sir Alexander intimated that the top 19 ft. ought to be pulled down. Then came the award under the London Building Act, which imposed upon the building owner obligations to do the work in a particular manner, and in particular to bond all new work into the party wall. Reading the two documents together, his Lordship said he had no doubt that there was thrown upon the defendant an obligation to properly bond the new wall into the plaintiffs' house, and it remained to be seen whether he could bring that state of affairs about to the satisfaction of the District Surveyor under the London Building Act without pulling the wall down. He was invited to say that the result of the report was that even if the defendant's construction of the agreement of May 23 was right, he ought to order the defendant to pull it down. He would have to consider what power he had under the statute or otherwise, to make such an order, but being still in doubt as to whether the work could be satisfactorily done without pulling down, he proposed to say that the Court being of opinion that the work which the award said ought to be bonded into the party wall might be properly bonded without pulling down, he made no order except that the costs be costs in the action.

OFFICIAL REFEREE'S COURT.
(Before Mr. MUR-MACKENZIE.)

Action by Contractor against Building Owner.

THE hearing was again resumed last week of the action brought by Mr. F. G. Minter, a contractor, whose headquarters are at Putney, against Mr. Charles Waldstein, Professor of Art at Cambridge, from whom the plaintiff claims £2,500, the amount said to be payable in pursuance of a certificate of Mr. Frederick William Foster, an architect, and in respect of a contract made between plaintiff and defendant for the carrying out of alterations and additions at Newton Hall, near Harston. Defendant raises a number of allegations of defective work, and presents a counterclaim for 10,000.

Mr. Lewis Thomas, K.C., and Mr. G. R. Bianco White (instructed by Mr. T. Bianco White) appeared for the plaintiff, and Mr. Clavell Salter, K.C., and Mr. F. St. John Morrow (instructed by Messrs. Withers & Co.), represented the defendant.

Mr. Clavell Salter, opening the defendant's case, submitted that the letters sent to Mr. Foster amounted to the very least to the suspension of the latter from the duties of architect, and, further, that Professor Waldstein, as the building owner, had the right under the circumstances to remove the architect. If there had been such dismissal or suspension of the architect, the letters would prevent the coming into existence of any valid certificate under this contract. Professor Waldstein was anxious to do everything that was morally right in this case; but he was being sued, hastily and unnecessarily, and he (Mr. Salter) asserted on his behalf his strict legal rights. Assuming the validity of the certificate, Counsel submitted that under this contract the plaintiff had proved no cause of action for the amount claimed, and that all indebtedness under this contract on the part of Mr. Waldstein to Mr. Minter had been paid, and more than paid, in the 17,500. The Professor had already paid. Mr. Salter went on to say that they had made inquiries to show how much additional work had been authorised under this contract, although it was really for the other side to prove that. So far as could be ascertained, however, the amount of additions to this contract which were authorised were comparatively unimportant, and in no way approached the neighbourhood of 11,400.

The building owner, Mr. Salter went on to say, was hardly ever a person with any knowledge of building. He was essentially a layman. As a student and scholar, Professor Waldstein was, perhaps, less able than the average man to take care of himself; he must trust himself to those whose duty it was to protect his rights. In defence of the plain words of the contract, they had got a sort of vague suggestion that these contracts were not to be rigorously looked at in practice, and Mr. Salter said he had asked of architects and surveyors to give the go-by to these written stipulations. He (Mr. Salter) had never been concerned in an architectural case which

approached this for unbusinesslike disregard of a contract. He certainly should not seek to discredit anything that Mr. Foster said, indeed, Mr. Foster had made a rather chivalrous appearance in the box in a vain attempt to cover Mr. Minter. Mr. Foster's reputation as an architect and artist might be great, but he had certainly been shown to be unbusinesslike in this case. Mr. Salter dealt at length with his client's counterclaim, and pointed out that his submission was that departures from the contract by the plaintiff, which were not authorised, as he contended, by Clause 12, were breaches of contract, and were actionable if these changes involved damage to Professor Waldstein. The house, commented Mr. Salter, seemed to have been built by a sort of commission. Mr. Green, the Clerk of the Works, appeared to have looked for instructions from whomever he could get. He either telephoned and wired to, or wrote to and called at the office in London for instructions from whatever person might be in charge. There was no legal competence in Mr. Foster to appoint any person to ratify or authorise departures from the contract. Mr. Salter submitted his client was entitled to damages wherever he could prove (1) departure, in fact, from plans and documents forming the contract; (2) damage to himself; and (3) where Mr. Lewis Thomas could not prove authorisation under the contract. This contract, which Mr. Minter had made with Mr. Waldstein, had been broken by the plaintiff in fundamental and essential respects. The contract made it plain that Professor Waldstein required, and was certainly ready to pay for, the very best dwelling-house that could be got. The Official Referee had been through these 270 defects. Like all these lists, this one consisted of large and small items all jumbled up together. Some of these items he proposed to abandon—not because Mr. Waldstein's complaints were not well founded, but because they were not complaints against Mr. Minter. Counsel then addressed the Referee concerning the timber supplied—the quality and the quantity thereof—floors, roofs, and drains, and he submitted that under these heads Mr. Minter had committed breaches of the contract. Some considerable expense must be incurred if they were to bring this house into conformity with the agreement. Counsel considered that the proposals made by plaintiff's witnesses, that Professor Waldstein should fur up all these floors, savoured of impudence. Professor Waldstein had consulted two eminent architects and surveyors, who declared that furring-up was no remedy, but were of opinion that if this house was to be restored as far as it could reasonably be to conform with the contract these floors must be constructed in accordance with the contract. Their suggestion was—and he wished to reinforce their suggestion as strongly as possible—that if the Official Referee were to give Professor Waldstein the cost of furring-up, with something thrown in by way of general damages, that that, to speak frankly, would not be giving him the whole of his rights. The Professor was entitled to have the floors in accordance with the contract, and the only thing was to take them up and relay them in accordance with the contract. Counsel said he would ask, amongst other things, for damages in respect of imperfections connected with the roof. Dealing with plaintiff's allegations that too little time had been allowed him for the carrying-out of the contract, Mr. Salter said that evidence would be given to show that there had been nothing to prevent the work being properly done, however short the period. He contended that it did not lie in the mouth of any man who had agreed to do the work properly to say the time was too short for him to do the work properly. Plaintiff's contract was to do the work well in a given time. Regarding the plaintiff's assertion that the overheating of the house had occasioned much of the mischief, Mr. Salter considered that there was nothing therein to justify a breach of contract on the part of the plaintiff. There was no evidence that Professor and Mrs. Waldstein were Salamanders and desired abnormal warmth. It became increasingly obvious in this case that the worst of these cracks and openings were due to settlements in the floors.

Evidence was then given on behalf of the Professor's case by Mr. Frederick Arthur Ball, of the firm of Messrs. Ball & Son, quantity surveyors, of No. 6, King's Bench walk. Witness said that he had visited Newton Hall many times. He had studied the specifications, the bills of quantities, and the plans. He had priced out the various items—mainly regarding reconstruction—as if he were pricing out for a builder. In great detail Mr. Ball pointed out alleged deviations from the contract, and suggested remedies.

On Tuesday, Mr. Frederick Henry Seale and Mr. Alfred Sears, timber merchants, were

interposed as witnesses for the plaintiff, and gave expert evidence as to the quality of the timber used in Newton Hall.

Mr. F. Lyon, butler to the defendant, Professor Waldstein, also gave evidence as to the alleged defects in the building, but admitted in cross-examination that in order to get the house ready for occupation by the Professor nearly the whole of the seventy radiators were used at the same time; but they were not used for saving fires. Mrs. Waldstein wanted a really warm house. Mr. Lewis Thomas: You know what an American calls a "really warm house"?—Oh, yes!

Mr. Lewis Thomas: About 84 degrees. Mr. William Saint, examined by Mr. Clavell Salter, said he was a builder—one of the leading builders—at Cambridge, with thirty years' experience. Amongst the building work he had executed witness stated that he had built the Presbyterian College at Cambridge at a cost of 35,000, and he was now engaged in making alterations at Emmanuel College at a cost of 30,000. During his thirty years' experience he had studied timber from a builder's point of view. He had also studied the specification in the present case, which provided throughout for the very best quality.

Witness was taken at considerable length and detail through the items in which it was alleged timber of an inferior quality to that specified was used, and generally gave evidence to the effect that the timber used was not of the quality specified for. He said that he did not consider that American pitch-pine was equal in quality to the best fir, and that it was very unwise to use it where there was not a free access of air. With regard to the roofs at Newton Hall, the witness stated that he had carefully inspected the woodwork of the roofs, and was of opinion that the timber used was not of the quality specified. He did not find any timber which could be described as the "best fir." Speaking generally as to the timber used in the two roofs, he should say that only about 20 per cent. of the timber used therein was of good quality, having regard to the class of work.

Witness also stated instances in which he considered the workmanship with regard to the woodwork was not as it should have been.

Cross-examined by Mr. Lewis Thomas. He first saw the specification in the present case early last July. He had never seen it before, and had never seen the bills of quantities. He did a great deal of work at Cambridge. He had not tendered for the work in question. He knew that the timber of the work in question came from Smith's Timber Company. He had formerly dealt with the company, and, no doubt, did so now. He had never had any difference with Smith's Timber Company. He was perfectly friendly with the company, and always had been. They were first-class timber merchants. He had heard the prices paid for the timber in the present case, and he considered they were fair charges for the class of goods.

Was it not a high price to pay for roof timber?—Oh, no, decidedly not!

Supposing an architect told you to do something in a building as a variation, and gave you a proper order under the contract, I suppose you would carry it out?—Oh, yes!

If you carry out the variation it is not your responsibility?—No; but I should want the order in writing.

If you put the joinery work on damp plaster it would not have a good effect?—No.

And if you put wallpaper on damp plaster it would not be satisfactory?—No.

Witness added that before he performed an order to do that he would call attention to the consequences which would ensue.

Cross-examined further, witness admitted that with regard to the timber specifying Christiansa meant sometimes a standard of quality. The timber coming from Riga was inferior to other timber in size. Archangel timber was divided into three grades, viz., first, second, and for joinery work. It enjoyed a high reputation for joinery work. He had seen two or three indications of the roof spreading. It was a common thing to house soft wood into hard wood.

It was the universal practice to frame up the truss from the ground.

Re-examined by Mr. Clavell Salter. Before he acted upon any order of the architect he should be careful to see that it was a proper order. It was not good workmanship to put joinery upon damp plaster, and it was not good workmanship to put paper on damp walls.

Witness added, in further re-examination, that he did not consider the timber used for the roofs was the proper timber to use, or that it was in proper condition for first-class work.

Mr. C. J. Jude, a builder at Harston, gave

evidence to the effect that he had been called in many times to Newton Hall for the purpose of freeing the doors. He was called in nearly every fortnight for that purpose. He had made a detailed inspection of the cracks and defects. With regard to the study on the ground floor, he noticed that there was something wrong with the girder. There was a sinking. There was also a crack over the fire-place in that room that got gradually worse. He noticed also that there was a crack in the ceiling of the billiard-room, and three cracks in the ceiling of the drawing-room. He noticed one some time ago, and two of them on the occasion of his inspection in July last. In the morning-room he was called in to remedy a crack on the top of the fire-place chimney-piece. He noticed two long cracks in the ceiling of that room. In the dining-room there was a bad crack in the ceiling under the girder. He noticed that crack early in the year. That crack was in much worse condition than when he saw it first. He also noticed other cracks in the ceilings, which had got gradually worse than they were when he first noticed them. He noticed that the matchboarding above the dining-room door had shrunk very badly. There were also cracks in the partition of the china cupboard.

Witness said that he had had to ease the doors of the kitchen leading to the scullery. That was necessary because the wood floor block had bulged away from the concrete floor—at least, that was his opinion. He also noticed some cracks in the ceiling of the housekeeper's room. He had also done some "easing" to the luggage entrance door and the larder door. The main entrance door to the garden from the new wing was also "eased" early in the year. Something was also done to the cellar door by his men, but he could not say what it was. In the hall, too, there was a long crack. In No. 1 bedroom on the first floor there was a crack in the cornice. Pieces of the cornice had fallen, and the last fall was at the end of June. In the corridor outside the bathroom there was a crack down the wall. He first noticed that early in the year. In the bedroom No. 1 he did something to the door leading to the dressing-room, but he could not remember what it was. He also found that the knobs to the cupboards in that room were broken. The ceiling in the room adjoining the dressing-room had a crack which went right along the partition. That crack had got very much worse.

Witness also gave evidence as to serious cracks which had taken place in the ceilings and partitions of other rooms. He said that most of the cracks were worse to-day than when he saw them first. They increased in length. He said that the door of the footman's bedroom had been eased several times, and probably wanted easing again. In the cook's bedroom the same thing occurred. There was also a serious horizontal crack upon the staircase leading from the first to the second floor. That crack had got much worse lately. He first noticed these cracks quite early in the year. Stamped paper was put up certain of the cracks early in March, and the stamp paper cracked soon afterwards. The case was proceeding as we went to press.

LONDON COUNCILS.

Croydon.—The tender of Mr. J. T. Simmonds, Croydon, has been accepted for the construction of conveniences in Frith-road. The following plans have been passed:—Mr. D. L. Gooch, 18, Sundridge-road, four houses, Everton-road; Messrs. Maides & Harper, Albert-road, nine houses, Northampton-road; Mr. A. Paxton, 74, George-street, shop and stores, 74, George-street.

Greenwich.—Instructions have been given to the Surveyor to submit an estimate for repairing part of King William-street with lithofalt. Plans have been passed for Mr. N. Drake for four houses, Vanbrugh Fields; also for additions to St. John's Church, St. John's-road, Blackheath.

Hendon.—Application is to be made to the Local Government Board for sanction to borrow 172l. the estimated cost of kerbing, etc., from Church-terrace to Sunning-gardens. Plans and estimates submitted by the Surveyor have been approved for making up Sanders place, Mill Hill, at a cost of 226l. The following plans have been passed:—The Kensington Freehold Trust, six shops and houses, Lawrence-street, Mill Hill; Mr. W. T. Streather, fourteen houses, Ella Russell-gardens, Golders Green; Messrs. Adams & Caxon, six houses, Crews-road, Child's Hill; Messrs. Haymills, Ltd., three pairs houses, St. Dunstan's-road, Child's Hill; The Second Hampstead Tenants, Ltd., thirteen houses,

Corringham-road and Addison-way; Mr. F. W. Bindon, additions to Golders Hill School, Finchley-road; Messrs. Edmondson, Ltd., six shops, Golders Green-road; Mr. John Hudson, enlargement of St. Peter's Church, Cricklewood; Mr. H. Phillips, four houses on land leading from Nan Clark-lane; Mr. H. E. Percy, six houses, Millway.

Heston and Isleworth.—The tender of Mr. T. A. Chapman, at 3,345l., has been accepted for the construction of surface water sewers at Twickenham-road, Isleworth. Tenders are invited for alterations to the Isleworth Branch Library. The following plans have been passed:—Messrs. Hamiltons, ten houses, Jersey-road, Osterley; Mr. A. Blomfield Jackson, additions to "Park View," Isleworth; Mr. W. Houghton, alterations to Nos. 75-77, Hibernia-road, Hounslow.

Ilford.—The following plans have been passed:—Mr. H. Hollins, six houses, Coventry-road; Mr. A. T. Haines, six houses, Leeds-road; Mr. E. T. Dunn, for Mr. F. C. Short, alterations to Nos. 3 and 4, Blythwood-parade, High-road.

Kensington.—The footway opposite Nos. 77-95, Kensington High-street, is to be repaved with 3-in. York stone, at an estimated cost of 84l.

Kennerley.—The tender of Mr. A. W. Porter at 122l. has been accepted for supplying and fixing of about 855 ft. of kerbing at Chadwell Heath, and about 440 ft. in Great Warley.

Southgate.—Plans have been passed as follows:—Mr. W. J. Keene, jun., nine houses, Burford-gardens, Palmers Green; Mr. W. Moss, twelve houses, Amberley-road, Palmers Green; Mr. R. Spendlove, eight houses, Avenue-road, Southgate; Mr. W. J. Ward, five houses, Green-lanes, Palmers Green; Mr. A. Ingram, twenty houses, Chimes-avenue, Palmers Green; Mr. H. J. Huckle, six houses, Conway-road, Southgate.

Tottenham.—The following plans have been passed:—Mr. W. Stone, store at Messrs. Maynard's, Ltd., Vale-road; Mr. J. C. Hill, additions to 80, Grand-parade, Green-lanes; Mr. L. Lebus, additions at Finsbury Cabinet Works.

Woolwich.—Plans and estimates submitted by the Borough Engineer and Surveyor have been approved for making up Everest-road, Lassa-road, part of Clay-lane, and part of Weigall-road, at estimated costs of 260l., 424l., 456l., and 734l. respectively. Plans have been passed for Mr. J. J. Bassett, 121, Earshell-road, Eltham, on behalf of Mr. A. C. Corbett, for ten houses, Dunvegan and Glenesk roads, Eltham.

OBITUARY.

Mr. Abbey, R.A.

We regret to announce the death, on August 1, at his town house, "Chelsea Lodge," The-street, Chelsea, of Mr. Edwin Austin Abbey, R.A., LL.D., F.S.A., and Honorary Associate (1905) of the Royal Institute of British Architects. He was born in Philadelphia in 1852, and entered the Pennsylvania Academy of Fine Arts, and in 1871 was elected a member of Messrs. Harper Brothers. At a complimentary luncheon given to him by the Pilgrims in the Savoy Hotel in May, 1903, Mr. Abbey related how he came from his native city, Philadelphia, to England, in 1873, with commissions from Messrs. Harper, amongst them being a set of illustrations for an edition of Herrick's poems. He quickly achieved fame with his work in black and white, and pastels, particularly with illustrations from Goldsmith's and Shakespeare's plays. In 1889 he won a first class medal at the Exposition Universelle, Paris. His first contribution to the Royal Academy exhibitions was "A May Day Morning" (1890); to that succeeded "Crusaders Sighting Jerusalem at Dawn" (1891); "O O Mistress Mine" and "Pout Pourri" (1903); "Fiametta's Song" (1894); "The Wooing of the Lady Anne of Warwick by Richard, Duke of Gloucester" (1895); "The Play Scene from 'Hamlet'" (1897); "King Lear and His Daughters" (1898); "Trial of Queen Katherine" and "Penance of Eleanor, Duchess of Gloucester" (1900); "A Measure" and "Salvator Mundi" for the reredos, Holy Trinity Church, Paris (1904); and the "Landing of Columbus on San Salvador Island" (1906). In 1896 he exhibited at the Nouveau Salon his 150 drawings of scenes from Shakespeare's comedies which, with his illustrations to "Othello," "Troilus and Cressida," "Macbeth," "King Henry VI.," and "King John," were published in *Harper's Magazine*.

In 1901 he was commissioned by the Merchant Taylors' and Skinners' Companies to paint a panel for the Royal Exchange, depicting the reconciliation feast of the two companies on the eve of St. John's day, 1484, and also to paint the altar-piece of the American

Church, Rue de l'Alma, Paris. In that year were shown in the Guildhall Galleries the ten pictures which complemented the series of fifteen: "The Quest of the Holy Grail;" as mural decorations for the Boston, U.S.A., Public Library. Ten years ago he began the remarkable set of eight decorative paintings for the four arches and spandrels beneath the drum of the dome of the State Capitol, Pennsylvania—with figures on round canvases of "Religion," "Law," "Science," and "Art;" and, in the lunettes, groups symbolical of the settlement in the State. His State picture of King Edward VII.'s Coronation, painted for Messrs. Thomas Agnew & Sons, was shown at the Hanover Gallery in 1904. Mr. Abbey was elected an Associate, R.A., in 1886, and Royal Academician in 1898; member of the Institute in 1893; Associate of the (Old) Water-Colour Society in 1894; member of the Athenaeum Club, under their Rule II., in February, 1901; he was President, 1901-3, of the Royal Birmingham Society of Artists; an Examiner, 1901, in drawings from the life, national competition, Schools of Art. The German Emperor conferred upon him a gold medal for art at the Berlin Exhibition, 1903, and he was a Royal Commissioner (British) for the International Exhibition, St. Louis, Missouri, in 1894. Mr. Abbey was a Chevalier of the Légion d'Honneur, member of the Institute of France, of the Société Nationale des Beaux-Arts, Paris, honorary member of the Munich Academy of Fine Arts, and of the American Institute of Architects, and honorary M.A., Yale University. He married, in 1880, Miss Mary G. Mead, of New York. At his country house, Morgan Hall, near Fairford, Gloucestershire, he built a large studio for his vast historical compositions for the House of Representatives at Harrisburg, Pennsylvania. In 1908 he was appointed to superintend the filling-in with paintings six panels of the corridor that leads to the great staircase in the Houses of Parliament. His portrait, by the late Sir W. O. Orchardson, R.A., was shown in the Royal Academy rooms last summer.

FOREIGN AND COLONIAL.

Building in Alexandria.

The British Consul at Alexandria (Mr. E. H. Mulock), in his annual report, states that building activity was very marked on the part of private individuals. Tenders for the Kait Bey or western branch of the East Port breakwater are to be asked for during the present year. Six months are to be allowed for the consideration of the project by the contractors, and it is expected that formalities will be completed and a tender accepted by January 1, 1912.

Carrara Marble.

The British Vice-Consul at Spezia reports that during 1910 the exports of marble from the district of Massa Carrara amounted to 29,339 tons of this total 28,339 tons were shipped to the United Kingdom—6,564 tons in the rough (blocks), 16,359 tons sawn (in slabs), and 6,566 tons otherwise worked. The report adds:—A new branch railway is in course of construction from the station of Aulla, on the Spezia-Parma line, to the northern side of the Carrara range, where it is believed there exists a better quality of marble, which, owing to the difficulties of transport, has not yet been quarried. When this branch is completed it will be a comparatively simple matter to convey the marble to Spezia, though it is more probable that the greater part of the product will be sent on by rail through Parma to Milan, and thence to Northern or Central Europe.

Building Activity in Marseilles.

Mr. Gurney, the British Consul-General at Marseilles, reports that the Civil Hospital is being rebuilt on modern lines, and the construction of a new hospital for contagious diseases is planned. The extraordinary activity in building houses supplied with all modern comforts and sanitary appliances in the better situated quarters of the town for the mercantile community, the proposed reconstruction of the Town Hall in the old town, and the consequent pulling down of slums dating from Roman times, the rebuilding of an entire quarter containing many blocks, from the Cannebière to the Rue Colbert, south and north, and from the Rue de la République to the Cours Belsunce, west and east, and the building in its place of a commercial quarter, provided with all the modern requirements, will not only give employment to the building trade for years to come, but will partly solve the problem of housing the people and providing business offices now lacking. The rapid extension of the Marseilles

tramway system, with its penny fares for long distances, which is spreading its lines into the suburbs in every direction, is tending to relieve the congestion of the city. Great estates in the close neighbourhood of the town are being sold in small lots and eagerly bought up. Cheap and comfortable houses are being built, the taste and ideas of comfort of the builders being fostered by housing exhibitions and competitions, or architects' plans. Large public

floor, thus rendering unnecessary the acrobatic feats on the top of a step ladder which usually accompany the fixing of the ordinary type of rose. The end, in the "Kwik-fix" system, is wired to two split pins, which are then simply slipped into the brass terminal blocks in the base of the rose. The china bridge is so arranged that the flexible end is made to bind in such a way as to make an effective end grip, and does away with the

"Kwik-Fix" Ceiling Rose.

parks are being added to the existing ones for the recreation of the people and the health of the children. Public works, with the view of facilitating transport by water and land, are in progress. The construction of the Madrague Dock, the deepening of the harbour, the building of a new dry dock, and the construction of the Marseilles-Rhône Canal, and of the new main railway from Marseilles to Miramas by Estaque and the Etang de Berre are all making excellent progress, though there has been one unfortunate hitch caused by a local strike of the miners and masons working at the Roue tunnel on the canal route. The industrial activity of Marseilles has been shown in providing electricity and cheaper gas and the extension of factories of various descriptions. The brick and roofing and flooring tiles industry has taken a large development. Roofing tiles are exported principally to Algeria, Turkey, Russia, and Australia; bricks to Senegal; and flooring tiles to the Argentine Republic.

Trade of China.

The following information is from the report of the British Acting Commercial Attaché at Peking (Mr. H. H. Fox) on the trade of China in 1910, which will shortly be issued:—
The sum of 1,203,004, spent by China last year on the purchase of foreign building materials, cement, timber, furniture, window glass, etc., is indicative of another far-reaching change which is coming over the habits of the Chinese people. The dilapidated rows of one-storied houses of lath and plaster, dark, unsanitary, and comfortless, which formerly did duty as Government offices, schools, barracks, etc., are rapidly disappearing before buildings in foreign style of brick and stone, fitted with such up-to-date conveniences as electric light and steam heating; while in all the large cities and trading centres merchants and shopkeepers are replacing the shanties of former days with modern constructions in which the *yanglou* or foreign upper story, and the plate-glass window, are usually conspicuous features. The style is more often than not atrocious and the work shoddy, but in places like Shanghai and Peking, where the protection of business buildings and Government offices has been entrusted to foreign architects, the results are not unworthy of a European city. As regards such materials as cement and bricks, China is already well supplied, and she is beginning to manufacture her own cement; but good timber is, owing to the reckless disregard of elementary principles of afforestation during the past 50 years, entirely lacking except in remote and inaccessible parts of the country. For such articles as steel joists and plates, ironmongery and tools, corrugated iron roofing, paints and distempers, window glass, electric accessories, water and heating plant, etc., China should be a good customer for many years to come.

TRADE CATALOGUES.

Messrs. A. Emanuel & Sons, of 7-13, George-street, Manchester-square, London, W., forward us particulars of the "Kwik-fix" ceiling rose. The construction of this rose enables the flexible end of a fitting to be wired on the

necessity of knots, besides reducing to a minimum the risk of short circuiting. Thus the weight of the fitting does not rest on the cover. As there are no back connections, there should be no surface leakage. By the use of the "Kwik-fix" ceiling rose, a number of temporary fittings can be kept at hand ready to slip into boxes, in order to get "tests" or new installations passed by the Supply Company.

PATENTS.

APPLICATIONS PUBLISHED.*

15,719 of 1910.—Oliver Imray (Administrator of Ulrich Wilhelm Ramsauer, deceased): Construction members of tubular form.

16,536 of 1910.—Albert Ernest House; Cowl for chimneys and the like.

18,445 of 1910.—Ferdinand Seifert: Window-guard for preventing children from falling out of the window.

20,576 of 1910.—John Henry Barker: Saws. 20,641 of 1910.—Henry Berry and Henry Berry & Co.: Shearing machine for gapping and notching channel bars and joists.

20,881 of 1910.—Georges Alexander Philippe Bellou: Soldering and other like hand-lamps. 21,513 of 1910.—Leon Billé: Joints for conduits and the like.

21,448 of 1910.—Richard Brierley: Hot-water systems.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not; notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications, and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this.

Any communication to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Promoted Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday. [N.B.—We cannot publish Tenders unless authenticated either by the architect or the owner; and we cannot publish announcements of Tenders unless in which the amount of the Tender is stated, nor any list in which the lowest Tender is under 100L, unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

[Architect's estimate, £6,000.]

Accepted on account of time.

BRIDLINGTON.—For alterations to the Corn Exchange. Mr. J. Earnshaw, architect, Carlton House, Bridlington.— £114 16 6

EDGWARE.—For additions and alterations to the Edgware Council school, for the Middlesex County Council. Mr. H. G. Crothall, Architect to the Education Committee

HARLOW (Essex).—For the erection of six cottages at Harlow, for the Oddfellows Society Harlow. Mr. Chas. E. Blackburn, architect, 355, High-road, South Tottenham

HAROLD WOOD (Essex).—For the erection of new domestic buildings, convalescent home, Harold Wood. Mr. J. G. Morley, Borough Engineer, West Ham

HEMEL HEMPSTEAD.—For erection of a school, for the Education Committee of the Corporation of Hemel Hempstead. Mr. Walter R. Locke, architect. Quantities by Mr. J. E. H. Low, Chesham

ILFORD.—For constructing a reinforced concrete culvert, for the Ilford Urban District Council. Mr. H. Shaw, M.Inst.C.E., Engineer and Surveyor to the Council

LONDON.—For erection of a public library at Enfield. Mr. R. Collins, Surveyor, Public Offices, Enfield

LONDON.—For redecorating the Central Offices, Storey-court, Strand, for the Metropolitan Water Board

LONDON.—For erection of a cottage at the Stoke Newington Reservoirs, for the Metropolitan Water Board

LONDON.—For roofing over Dowson's dock subway with steelwork, to support the public highway in Narrow-street, Limehouse, E., for the Metropolitan Borough of Stepney. Mr. M. W. Jamieson, A.M.Inst.C.E., Borough Engineer

LONDON.—For alterations to the domestic portion of 85, Balford-road, Hackney. Messrs. Gordon, Wilson, & Co., architects, 1, Vaughan-avenue, Goldhawk-road, W.2.

LONDON.—For alterations to No. 5, Upper Berkeley-street. Mr. Fredk. W. Foster, architect, 25, Bedford-row, W.C.2. Quantities by Mr. L. H. G. Stanbrough, 26, Bedford-row, W.C.2.

LONDON.—For alterations and additions to Warwick House, St. James's, S.W., for Miss M. Headley Dodge. Mr. Frederick W. Foster, architect, 25, Bedford-row, W.C.2. Quantities by Mr. L. H. G. Stanbrough, 26, Bedford-row, W.C.2.

LONDON.—For alterations to premises, 42 and 44, Stoke Newington School, Behnd Green, and conversion of a combined cookery and laundry centre, for the London County Council

LONDON.—For extending the boys' staircase at the Silwood-street School, Rotherhithe, for the London County Council

LONDON.—For erecting a housewife's centre at the Daniel-centre School, Behnd Green, and conversion of a combined cookery and laundry centre, for the London County Council

LONDON.—For rebuilding No. 312, Vauxhall-bridge-road, S.W. Mr. Fredk. W. Foster, architect, 25, Bedford-row, W.C.2. Quantities by Mr. L. H. G. Stanbrough, 26, Bedford-row, W.C.2.

LONDON.—For alterations and additions to 7, Crownwell-road, South Kensington, for the Hon. Kenneth Campbell. Mr. B. Vaughan Johnson, M.A., A.R.B.A., architect, 10, Queen Ann's-square, S.W. Quantities by Messrs. Tucker & Huntley, 22, Buckenham-street, W.C.2

LONDON.—For drainage work at the Brownhill-road School, Lewisham, for the London County Council

LONDON.—For construction of conveniences at Wandsworth Common, for the London County Council

LONDON.—For underpinning walls at the Industrial School, Hammersmith, for the London County Council

LONDON.—For painting and cleaning the Westville-road School, Hammersmith, for the London County Council

LONDON.—For electric lighting at the Kensington (North) fire-station, for the London County Council

LONDON.—For alterations to the chief fire-station, for the London County Council

LONDON.—For the erection of a secondary school for girls on the "Furzedown" site, Wandsworth, for the London County Council

LONDON.—For extending the boys' staircase at the Silwood-street School, Rotherhithe, for the London County Council

LONDON.—For erecting a housewife's centre at the Daniel-centre School, Behnd Green, and conversion of a combined cookery and laundry centre, for the London County Council

LONDON.—For alterations to premises, 42 and 44, Stoke Newington School, Behnd Green, and conversion of a combined cookery and laundry centre, for the London County Council

LONDON.—For extending the boys' staircase at the Silwood-street School, Rotherhithe, for the London County Council

LONDON.—For erecting a housewife's centre at the Daniel-centre School, Behnd Green, and conversion of a combined cookery and laundry centre, for the London County Council

LONDON.—For alterations to premises, 42 and 44, Stoke Newington School, Behnd Green, and conversion of a combined cookery and laundry centre, for the London County Council

LONDON.—For extending the boys' staircase at the Silwood-street School, Rotherhithe, for the London County Council

LONDON.—For erecting a housewife's centre at the Daniel-centre School, Behnd Green, and conversion of a combined cookery and laundry centre, for the London County Council

LONDON.—For alterations to premises, 42 and 44, Stoke Newington School, Behnd Green, and conversion of a combined cookery and laundry centre, for the London County Council

LONDON.—For extending the boys' staircase at the Silwood-street School, Rotherhithe, for the London County Council

LONDON.—For erecting a housewife's centre at the Daniel-centre School, Behnd Green, and conversion of a combined cookery and laundry centre, for the London County Council

LONDON.—For reconstruction on the conduit system of electric traction of tramways in (i) Seven Sisters-road and Green lanes and (ii) Green-lanes and Southgate-road, for the London County Council—

EVIDENCE IN PRIVATE BILLS.

PARLIAMENT having now laid down the general principle that in future all Private Bills must show a proper consideration for any æsthetic questions involved; and must be prepared by and with the advice of qualified experts, it is time that the procedure of the Select Committees should be so altered and improved as to give effect to the will of the nation.

If we consider this ruling in conjunction with the emphasis laid on the value of the amenities of our cities in the Town Planning Act we are encouraged to assume that the national conscience is at last fully awakened to the enormity of

our previous methods, and that we have at length realised that material prosperity is not the ultimate end of life, or even of the conduct of public affairs, or the practical satisfaction of material necessities the only object of our public improvements.

Interpreting this principle in the widest sense, we are justified in saying that it should not apply only to bridges over the Thames, but to all constructive and engineering work throughout the country, not only bridges, but railways, docks, canals, and harbours—in fact, to every class of work of whatever description that affects the amenities of the town or alters the face of the country-side.

The difficulty is that when a Private Bill comes before a Select Committee there is no one to say whether or not it involves æsthetic questions. When we think of some of the so-called improvements perpetrated in the past we are quite prepared to believe that a Select Committee approved them without ever realising that any artistic questions were involved; and even now we could almost believe it to be possible, for we are not aware that there is any competent authority whose duty it is to say whether a Bill does or does not affect them. Neither are we aware that any machinery exists to ensure that where such questions

are affected they shall receive adequate consideration.

Possibly it might be better to withdraw all Bills affecting artistic questions from the Select Committees and deal with them otherwise, but while the present method obtains the procedure should at least be more suitable to the nature of the matters to be discussed.

The extraordinary thing is that, although their interests may be vitally affected, the general public can do nothing. They have no standing and no right to protest. The proposals before the Committee may prejudice public interests, but, unless they also prejudice private interests, it seems to be left to the chance that some public-spirited society may happen to notice what is going on, and be willing to be heavily penalised for presuming to be so public-spirited as to oppose it in the interests of the general welfare of the State. Even then it seems that they have no legal right to appear, but must obtain the permission of the Committee and the gracious consent of the promoters, who have a right to object to their appearance. Surely such matters should not be left to chance; recognised opposition seems as necessary here as in the House itself.

At present the procedure seems all in favour of the promoters—whether their proposals are good or bad. If anyone whose personal interests are affected opposes the scheme his opposition is discounted as being prompted solely by a selfish regard for his own interests. If any one who, having special knowledge of the subject and no personal interest to serve, might be credited with a disinterested regard for the public welfare, ventures to say a word he is promptly told to mind his own business. If he does get in a word of protest it is by favour of the Committee, and not by right. In either event the promoters score. Given a sufficiently wealthy Corporation and anything may go through.

We could well imagine that this procedure might be a relic of the days when influential capitalists were able to influence the procedure of Parliament to suit their own interests and not those of the public, but it seems rather out-of-date in these democratic days.

When the subject under discussion is of an ordinary business nature, with which the ordinary business man is competent to deal, it might with justice be contended that the members of the Committee are there to represent the public and to protect the interests of the State; but even if they could always be trusted immediately to grasp the full significance and effect of a scheme with which they were not previously acquainted, and to discover for themselves the many aspects of the case deliberately withheld from their notice by the promoters, they would not be competent to protect the interests of the public, where architectural and other artistic questions were concerned, unless they happened to be artists themselves.

If, realising their own limitations, they admit the value of expert evidence, they should also realise that the case for the promoters is only one side of the question. If this is supported by expert evidence the interests of the State may demand that

equally competent evidence be called in support of the other. There is never any harm in hearing both sides of a question.

THE ARCHITECT AS BUILDER.

THE more recent developments in the organisation of garden suburbs have included one that has aroused a marked interest among architects and others. The fact that this interest has taken the form of criticism, in some cases favourable, but in others most definitely adverse, does not in our view prove it to be undesirable that the experiment in question should have been made; indeed, we are inclined to think that it must have been of considerable value in many cases in bringing home to many a young architect a number of practical considerations, unconnected with the art of architecture, but very germane to the execution of building work. The exhibition at Gidea Park and others of a similar character have admittedly been more or less experimental, and, while both from the architectural and the commercial standpoint some defects have become apparent, yet the knowledge gained may be held to have justified the experiment.

The promoters seem to have clearly indicated the terms that they were prepared to offer. These were evidently intended to be fair and reasonable, and, if a competitor thought not, he was in no way compelled to take part. The conditions appear to have been closely adhered to throughout, and on the business side we cannot see that any case has been made out against the promoters. Of course, we must recognise the regrettable case in which a young and struggling architect may have been tempted into taking up financial responsibilities for which he is unfitted, and which may distract him from his legitimate avocation, but, on the other hand, there are others to whom such a competition must have given a lead as to the direction in which they can be of most service to the public.

As a general rule, however, it is certainly not in the best interests of architecture that it should be combined with financial speculation, though there are a limited number who can work usefully on these lines. This being the case, we think that any future schemes for improving the architecture of our suburbs should keep quite distinct the questions of design and of building. There are many ways of doing this, and not only will such a division, which is but the one generally recognised as expedient, avoid the objections that have been pointed out, but it will result in a far superior architectural treatment for such an estate.

The weak point in the garden city and garden suburb is the "bitty" and confused effect resulting from the multiplicity of ideas packed into a limited space. However careful the arrangement, when we see in a road some 200 yds. long the work of some twenty architects, each of whose designs was prepared without any knowledge of what the others were doing, there is bound to be too great a

variety of treatment and consequent confusion in the ensemble.

If prizes were offered for designs only, then the successful competitors can be allotted, not a scanty 40-ft. or 50-ft. plot, but an area sufficient for a group of houses harmoniously arranged. The building should be done by the estate; or if this is, for financial reasons, impracticable, the promoters are surely in as good a position to arrange for builders to take up the ground as is the individual architect. At Gidea Park some of the estate is being dealt with in this manner, and this portion compares favourably with that devoted to the exhibition, simply because of the advantage gained by designing a group of houses on uniform lines, over the more or less haphazard juxtaposition of specimen cottages.

Thus we find two drawbacks to the method of making the architect his own builder—one the personal influence on the architect as an artist, and the other the effect on the architectural character of the estate owing to the compression of too many ideas into too small an area. Taking both these into consideration, we think that promoters will be wiser in future if they rely on the older method of obtaining their architecture and their financial support from distinct sources.

We would not discount the value of the experiments that have been made, as we cannot but feel that without them we should not have been able to realise many of the possibilities before us in suburban developments. Probably most of the architects who have taken part in them have gained valuable information at not too costly a rate; but experiments are useless unless they add to our stock of knowledge, and we may anticipate that future ones will take a somewhat different form.

NOTES.

Hyde Park
Corner
for King
Edward VII.

WE are very pleased to find such a general consensus of public opinion in favour of Professor Adshead's plan for the memorial to King Edward VII. published in our columns last week. It has been placed before a number of Members of Parliament and their opinion is almost unanimously in favour of this site in preference to that at present approved by the Committee. This Committee will be asked to consider the new proposal, and we cannot but feel that they will be impressed by its many advantages. Among these it may be mentioned that it is in as close a relationship to Buckingham Palace as either of the previous sites, and is on that ground likely to meet with the King's approval, while its detachment from the Victoria Memorial gives it an independent value of its own instead of rendering it merely a kind of annex to that scheme, such as it would have been in both the first site selected and the one at present officially supported by the Committee.

The Traffic
Question.

WHILE the question of a memorial should be decided solely on the grounds of its expressing artistically the attributes of the individual commemorated and should not be mixed up with

the fulfilment of practical demands, only a pedant would object, if it can be shown that these first requirements are adequately met, if other gains can be claimed in addition. Now Professor Adshead's scheme, as well as providing a fine site for the monument, very greatly improves the possibilities for traffic control at this point. Since the time of last "improvement" at Hyde Park Corner, we have grasped the disadvantages and risks of large open spaces intersected by numerous traffic routes, of which this is a typical example. We now know them to be dangerous to the pedestrian, and costly in the amount of direction demanded for the traffic. Any scheme more in accord with our present knowledge of traffic requirements may certainly claim this as an added merit.

The Greater London Railway.

We cannot think that in rejecting the Greater London railway scheme, the Committee of the House of Lords has acted in the best interests of our great city. Though at the present time the scheme may be a little in advance of the requirements, it will in the near future become impossible to carry out on account of the enhanced value of the land it would require to schedule. It possesses many points of similarity to the railway portion of the scheme propounded by Mr. D. Barclay Niven, and supported by Mr. G. L. Pepler in a carefully reasoned paper read before the Town Planning Conference last October. The general merits of such a scheme are obvious, and we must naturally feel some regret in seeing the rejection of any proposal that might lead to its adoption, if only in part. We do not believe that we have heard the last of the Greater London Railway, and we should not be surprised to find the proposal revived. Might we hint to the promoters that if their scheme provided for an outer boulevard, and other amenities, it should carry with it a force of public support that no Parliamentary Committee could resist?

The Citadel of Aleppo.

In a letter to the *Times*, Mr. H. Pirie-Gordon draws attention to the shameful neglect of the historic monuments in Asia Minor and the supine attitude of the Government at Constantinople towards these. In Urfa the Byzantine walls are in process of being destroyed; at Berdjik, a similar destruction is taking place; and now it has been publicly announced that the Castle of Aleppo is to be levelled, and the stones sold as building material. It is almost inconceivable in these days that such a piece of vandalism should be attempted. Aleppo, without the castle on its citadel hill, will lose all claim to distinction; one might almost as well talk of levelling the Acropolis by way of improving Athens. The extent to which Aleppo depends on this citadel group for its effect may be appreciated by any who have at hand "Amurath to Amurath," by Gertrude Lothian Bell.

A CASE recently decided in the Courts, in the course of which it was alleged that an architect had, by special request or instruction from his

client, withheld a certificate due to the builder, led to a judicial pronouncement which cannot fail to be of service to the profession. Some clients seem to think that an architect can be retained, like an attorney, to exact the last pound of flesh from the builder, and to strain the authority vested in him by the contract in the owner's interest to the utmost extent that legal technicalities will permit. On the contrary, the judges laid it down that the position of the architect, as between client and contractor, is an impartial and judicial one. We think this fact cannot be emphasised too often, and that its recognition by the courts cannot fail to be specially helpful to young architects. Being naturally anxious to build up a practice by pleasing their clients, they may find it rather difficult at times to hold their own with influential people, who may be disposed to be overbearing.

THE STORY OF THE BRIDGE.

By WALTER SHAW SPARROW.

I.—PRIMITIVE BRIDGES.

It is reasonable to suppose that prehistoric man owed his first timber bridge to a storm of wind, which hurled down a tall tree across a wide crevasse in a glacier of the Ice Age. Many a bridge of this accidental sort was probably used long before the period of the cavemen, during those mysterious times when a type of ape, growing tired of its own active life on all-fours, passed through its evolution from monkeyhood into manhood, leaving a great many of its kith and kin either stranded for ever at the halfway stations of gorillahood and chimpanzeeism, or hopelessly in the rear as little and agile tree-climbers. As man seems to have had for his first ancestors a breed of apes born with a taste for experiment and discontent, it is not surprising to find that the earliest human efforts to pass from bad to better took hints from Nature and her marvels. Cave-lions and cave-bears were compelled to give up their homes to man; the fire stored in flint was discovered when the first human weapons were chipped to a point; clay was moulded into utensils, and the building methods of birds and beasts were patterns for imitation. We know, for instance, that man dug round pit-dwellings into which he crawled on his stomach along a circular burrow, finding warmth and safety

in the earth like many other animals. Later, encouraged by the example set by beavers in their dams and lodges, human craftsmanship evolved the lake-dwelling and the round hut, using for the timber walls the same plaster of mud mixed with straw and loam that house martins have ever employed in their nest-building.

Well now, as soon as man had passed through that technical evolution to which he owed the solid foundation of his lake-homes he was a primitive architect, with knowledge enough to build a bridge of timber; and if we keep in mind the way in which he laid enduring foundations in a lake we may infer, without any great extravagance, that his wooden bridges were akin to those at Srinagar, the capital of Kashmir, a city founded in the Vth century A.D., and justly famous for the quaint youth of its unchanging architecture. Seven bridges there span the River Jhelum, which is the Hydaspes of the Greek historians, and to study their construction is to feel oneself intimately in touch with a little Venice belonging to the long-ago of primeval handicrafts. I give two photographs, and as each represents a bridge having a superstructure of frail shops, partly held up by poles, the probable resemblance to a lake-village is plain for us to see. The piers are made of beams laid criss-cross, and in one bridge there is no angular platform below the piers to break the force of the current after heavy rains, while the pier timbers in the other rest on foundations similar in shape to those that Colechurch and Isebert designed and made for the great Old London Bridge, with its romantic houses, its chapel, its defensive towers, and cellars in the thickness of the piers. Old London Bridge, finished in 1209, and destroyed in 1830-31, had the same lineage as the shop-bridges of Srinagar, the first ancestors being prehistoric huts built over lakes on artificial islands formed of logs, brushwood and peat, with upper layers of timber, and branches held in position by scores of little piles.

But, although the workmanship at Srinagar is very primitive, you will see that the piers have been influenced by the progress of art in India, for the horizontal beams, cut in varying lengths, are composed, and they suggest a rude arch between the piers. This evidence of progress, too, is more noteworthy in another bridge at Srinagar, a bridge of unmortared stone, with booths of timber, over the Marqual Canal. Here the arch is nearly triangular, suggesting a descent from that cone-shaped hut from which the beehive houses of stone inherited the inclined jambs to their doorways.

Thirlmere Bridges.

(Photo. by Frith.)

The bridges at Srinagar, again, are not all burdened with houses. Some have nothing more than a narrow footway of boards and parapets of simple latticework. A very attractive example, with six piers, crosses the Jhelum at Baramulla, and beyond, but near to it, a primeval-looking village basks in the shade of the Himalaya Mountains. Here, if anywhere, we have a type of bridge similar to the prehistoric—if, as certainly seems probable, the art of the lake-dwellers left its sheltered moorings and adventured across rivers.

India is rich in primitive bridges, and I have now to speak of the suspension bridges of bamboo, near Darjeeling, for instance, and also in the Bermuda Hills. Here, in the Buria Kol, bridge-ropes are made with the glossy and silky fibres of the Nilgiri nettle. As to the general look of the handicraft, it is like human spider-webbing, and its effective simplicity and strength ought to lessen the busy pride that engineers now take in metal suspension bridges having often a prodigal ungainliness.

Thus far we have taken a rapid glance at primitive work in wood and in cane. To this part of our subject several Roman bridges belong. The earliest bridge built at Rome was called the Bridge of Stakes, Pons Sublicius, built, it is said, by Ancus Martius, then reconstructed by the high priests, who thereupon became known as "Pontifices." An illustration of the Pons Sublicius, adapted from historical descriptions, will be found in Colonel Emy's *Traité de l'Art de la Charpenterie*. The piles were driven into the river's bed, then straightened at the top with strong wind-braces; hurdle-like piers were formed in this way for the superstructure, which had latticed parapets. On this bridge Horatius Coclès passed for all time into the heroisms that beget their like.

The Pons Sublicius is believed to be the form of bridge that the Romans used frequently in their colonies, and this belief is reasonable, particularly as regards England, for England was a land of forests, and if the Romans had built important bridges of stone some relics of them would have been found in our larger rivers. Timber bridges, too, belong to the traditions of English workmanship, and a good many of them were stake-and-pile bridges. There was one at Windsor in the XVIIth century, and its primitive craftsmanship contrasted oddly with the Castle. Artists liked to draw it, and I have seen it in a picture by Joseph Farington, R.A., who lived from 1747 to 1821. Twenty years ago a very picturesque bridge of stakes kept the past alive at Old Shoreham, Sussex, but a recent illustration in Mr. F. G. Brabant's "Sussex" shows that it has been made as dull as grammar at

a wedding breakfast. Even so, its lineage is very ancient; there was a lawsuit about the bridge in the sixth year of Edward II., and it was then so old that a part of the woodwork had fallen into the river. And I dwell upon these matters here because the Old Shoreham Bridge of twenty years ago showed no more art in its construction than that which went to the making of a prehistoric lake-village.

But we turn now to another point. How were stone bridges evolved? This question belongs to the domain of speculative reasoning, but we can start out from definite facts. It is safe to believe that primitive man must have used the stepping-stones across rivers that the hazards of Nature often placed in the waters. This was the earliest bridge of stones, but its value to man not only varied from day to day, but was of no use at all when it was needed particularly—that is to say, after heavy rains, when rivers became too rapid or too deep to be forded on foot. Primitive man could not fail to notice this fact, and would he not apply to it his ripening intelligence as a builder? Each stepping-stone was a foundation for other stones to rest upon, and a cluster of them, carried up to a given height above the surface of the river during a flood, would form a pier, across which logs or slabs of stone could be laid to another pier, just as they are to-day in the Pont-y-Pant, in the Lledr Valley, Wales.

One remembers, in this connexion, that a famous bridge at Babylon, over the Euphrates, mentioned by Herodotus and Diodorus Siculus, had stone piers and a footway of movable planks, which were not left down at night. This bridge is ascribed by Herodotus to Nitocris, and by Siculus to Semiramis. It was easy to defend, and this good quality gave a long life to its central idea. A mediæval bridge with movable planking still exists in France. I have seen a photograph of it, but forget the name.

Very often the Romans used stone piers and a superstructure of wood, as in Trajan's magnificent bridge across the Danube, just below the rapids of the Iron Gate. This great achievement, dating from A.D. 104, and designed by Apollodorus of Damascus, was partly destroyed by Hadrian, who said that it made a passage along which the natives could make raids to the injury of the Roman rule; as if a system of barriers and guards could not have held the great footway against all comers. Still, relics of thirteen piers remain to this day. Originally the bridge was about 1,300 yds. long, with twenty arches of hewn stone, which, according to Dion Cassius, were 150 ft. high, 60 ft. wide, and 170 ft. from each other. Here we have travelled far from the Pons Sublicius

and the primitive bridge of planks or of stone slabs resting on stones. It is believed that in Trajan's bridge the piers were founded by sinking caissons, while during the building of the piers for the Babylon Bridge the Euphrates was diverted from its course. This happened also to the Thames when Old London Bridge was constructed, according to Stow.

Finally, which is the earliest type of stone bridge in Great Britain? If stepping-stones were ever developed into piers of loose boulders, we must expect to find some tradition of it in those parts of the country where descendants of the prehistoric inhabitants sheltered themselves from successive invasions. Ethnologists are now pretty well agreed that there are people in the British Isles whose lineage is probably as old as the Neolithic folk of England. They are dark, short, virile, and oval-headed; their features are small and their tempers quick; they are to be met with in Cornwall, Wales, the Isle of Man, Ireland, and the West of Scotland, as far north as the Orkneys. Well now, it is from Dartmoor that I choose for illustration a very primitive bridge made with granite slabs resting on granite piers. It stands at Postbridge on the East Dart. Locally it is called a "clapper" bridge, and its type is common in Cornwall. One is reminded at once of Stonehenge.

This does not mean that the "clapper" bridges still extant belong to pre-Roman times. They are mediæval, but the principle of their structure is prehistoric. The same type, but with variations, is found also in Wales, and I note particularly the Pont-y-Pant, in the Lledr Valley, for its piers are loose fragments of rock, and the wooden footway is primitively rustic. Here is a bridge that belongs to what I venture to call the period of developed stepping-stones. Among my illustrations is a good English example of primitiveness, at Thirlmere. In this quaint thing the stones form a sort of dam with angular holes in it, across which run wooden hand-bridges. Imagine how easy it would be in a shallow river to convert stepping-stones into a bridge of this kind, leaving a space here and there for the water to pass through.

DEPTFORD LIBRARY COMPETITION.

The site provided for this building is perhaps as good as could be expected. An island site is, of course, necessary to a perfect architectural rendering of the programme, but, where one with three frontages is provided, we are bound to recognise how much worse it might have been, and to be grateful accordingly.

The chief trouble with the site is that it faces the wrong way. It is rather long and narrow for a library, and its shorter side faces the main street. This leads to difficulties with the entrance. Considering the shape of the site, the natural place for the entrance is perhaps in the centre of the longer frontage to the side street; but from the point of view of approach it should be in the shorter frontage to the main road.

In the circumstances the competitors seem to have been in considerable doubt as to the course to pursue. The majority, including the author of the first premiated design, Sir A. Brunwell Thomas, and of the second, Messrs. Castle & Warren, place the front entrance at the narrow end of the site in the main street, while the author of the third premiated design, Mr. Henry T. Hare, was evidently so keenly alive to the advantages of both positions as to send in two complete designs. Others again, such as Mr. S. B. Russell, and Messrs. North & Robin, make out a very good case for placing the entrance at the side.

When a premium is awarded to a competitor who has submitted two complete schemes it would always be interesting to know to which the premium is given. In this case, we presume, it is to the one with the entrance in the same position as those placed first and second, but in other cases it might not be so obvious.

If we accept the point of view that the entrance direct from the main street is of the

[Photo. by C. S. Sargisson.]

The Weaver's Bridge, Wycollar.

First Premiated Design, by Sir A. Brumwell Thomas.

first importance, we find that the frontage is too narrow to admit of a central entrance. This has led to the entrance being placed on the side nearest the adjoining buildings, and the result is a type of plan that is more characteristic of a town house than a public library. The entrance corridor with staircase is taken straight through the depth of the news-room, which has its narrow end to the front, and is lit from front and side, and leads direct to a large room at the back—the lending library—the whole width of the site, which is lit from the side street, as behind it again is a block of staff rooms and stores lit from the back street.

This at once leads to difficulties with the sub-librarian's room, which cannot be both conveniently situated and properly lit, and with the lighting of the corridor, and the public space and counter of the lending library. To obtain light from the windows of the side street between the rows of stacks, the counter has had to be placed on the opposite side of the room where there is no light for the indicators. To obtain this light the public space is top lit, which involves the main wall of the reference library on the first floors being set back over the counter and carried over a space of some 30 ft. Practically the only one of the competitors on these lines who has been able to avoid this structural and aesthetic defect is Mr. Maurice B. Adams, who solves the problem

by boldly lighting both his ground and first floors from the garden of the adjoining property. Assuming that this expedient is allowable by the terms of the conditions, it has, of course, the added advantage of giving more room on the first floor.

The winning design by Sir A. Brumwell Thomas has achieved an apparent simplicity and straightforwardness of plan which probably went far to gain him the award. In order to obtain such desirable simplicity it may, of course, be necessary to make some sacrifice of accommodation and convenience of arrangement. It is, however, just a question whether in this case the process has not been carried too far, unduly cramping the staff and store rooms at the back—the book store being reduced by nearly one-half its area—crowding out the librarian's room from its most convenient position and placing it where it would be more suitable for a public room, and crushing the sub-librarian into a distorted apology for a room on the wrong side of the entrance corridor. Everything goes to the wall for the sake of a straight line—especially the sub-librarian. It is just possible that in revising this scheme for execution some of its simplicity will disappear, for it seems to be more or less arbitrarily imposed on the plan.

The main justification for making any undue sacrifice for the sake of breadth and simplicity of plan is, we suppose, that the loss can be

repaid by simpler and sounder construction, and by the greater breadth and finer architectural character of an elevation which is the natural result of such a plan. In this case, however, the elevation, although in itself one of the most pleasing, has no relation to the plan, and gains nothing by this process over those which show no undue sacrifice.

What seems so unaccountable is that, having taken considerable pains and some liberties with the programme to pull the plan together into an architectural form—which presumably he thinks the right form—the author should deliberately go back on himself and refrain from making use of the advantages so obtained by declining to give a straightforward expression of his straightforward plan. He takes some trouble, he appears to think it worth while to make some sacrifice, to obtain the structural suggestion of an interesting elevation, and then he seems to think better, or worse, of it, and hides it all behind a screen wall, as if he was ashamed of it. Had the main bulk of the large rooms been emphasised on the elevations and a separate feature made of the entrance block something characteristic would have resulted. As it is, the elevation is a sham, having no proper relation to the internal structure.

To produce a striking plan and an equally striking elevation having no relation one to the other is not the way to produce architecture, but it may be the way to win competitions while assessors continue to be impressed by such methods.

It must not, however, be supposed that the winning design is the only sinner in this respect. Indeed this falsity of elevation seems to be the weak spot of nearly all the designs that enter from the front. With the exception of Mr. Adams they all shirk the logic of the situation and try to make this entrance front look as if it was one large room from end to end. Curiously enough, they all adopt the same general treatment—a more or less solid mass at either end with three bays between, but as this is evidently not suggested by the plan, we can only guess at its source of inspiration.

The advantage of the side entrance as illustrated by the designs by Mr. S. B. Russell and Messrs. North & Robin, is that, apart from arrangement, it seems to avoid the necessity for dishonest construction. Neither does it tempt to false elevational treatment of the front. As the newsroom can be taken from end to end the single unit expression of this front, after which most of the competitors seem to hanker, can be naturally and reasonably obtained. In this matter of straightforward expression Mr. Russell's design is, we think, one of the best submitted. The elevations themselves considered without reference to what is behind them—which, however absurd, seems the fashion here—may not perhaps be generally considered so pleasing as those of the winner, but they are more truthful and expressive, and the design generally, whatever its defects, is, in our opinion, more on the lines that make serious architecture possible.

Other designs on the same general lines as the premiated ones are those by Mr. Albert L. Guy, Mr. Arnold S. Tayler—who in sacrificing convenience for the benefit of his sub-librarian obtains an awkward staircase—Messrs. F. J. Edle & Meyers—whose attractive plan shows a sense of the value of internal architectural forms, but whose treatment of the house-keeper's apartments can hardly be justified—and Messrs. Newman & Newman.

Messrs. Young & Horsley submit a completed alternative. Both designs have pleasing elevations, and both plans show the counter of the lending library parallel with the book

Second Premiated Design, by Messrs. Castle & Warren.

Second Premiated Design, by Messrs. Castle & Warren.

stacks, and dividing this room from the newsroom.

We do not consider that the general level of achievement shown by these designs is any argument in favour of limited competitions.

"SOUTH KENSINGTON."

THE EXHIBITIONS OF THE NATIONAL COMPETITION AND THE ROYAL COLLEGE OF ART.

The exhibition of work by students of the Royal College of Art and that of the prize-winning and the commended designs submitted in the National Competition may be taken and grouped together because they are both for the greater part the outcome of a systematic attempt to educate the nation in art and the crafts, which may be conveyed by the term "South Kensington." The definiteness of the connotation implicit in those words is sufficiently established; all that is official, all of education in matters connected with the arts, that is controlled from Whitehall is thereby conveyed. And these exhibitions, both open at present, the one of the Royal College, recruited for the most part from those who have graduated—who have obtained a diploma—from one of the many schools associated with South Kensington and subject more or less to its control, and the other, of the National Competition, are the product and vindication of the Board of Education machine.

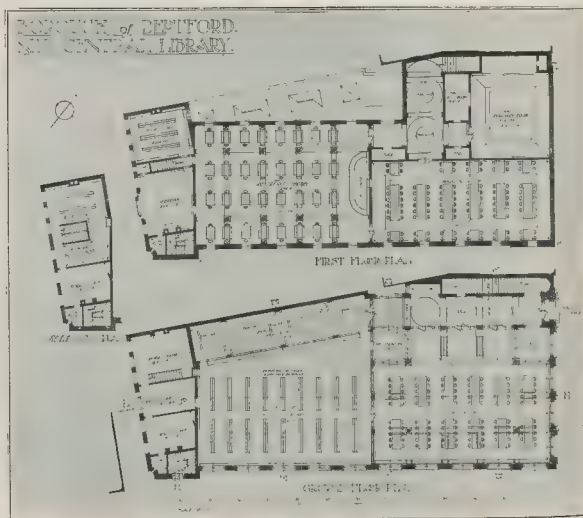

The term "machine" is by no means intended to convey disapproval or contempt. But it should be borne in mind that it is a "machine," that it is an organisation of a sort commonly assumed to be repugnant to the British mind when it turns its pellucid gaze upon affairs of art; an organisation, in fact, in a realm over which a whisper of any such thing must sweep like a blighting wind. It is, moreover, an uncommonly big machine. In every town in the kingdom of any considerable size it has its net spread wide. More often than not, the only art and technical school in the place is subject, if not in official fact, then as helplessly in a slavery of method and aim. For the power which has in its gift the mead of official reward with "National" as compelling prefix, must impose, whether it thinks it does so or even wants to or not, some measure of the methods necessary to procure the results of which it approves. The inevitable tendency of the permanent, yet subordinate teacher is to work for immediate results. And so all but the very wayward or the seemingly obtuse, the very poor or those who are rather rich, get caught.

It is not our business here and now to expound, defend, or condemn "South Kensington" as an influence in the artistic development of national talent. As a system

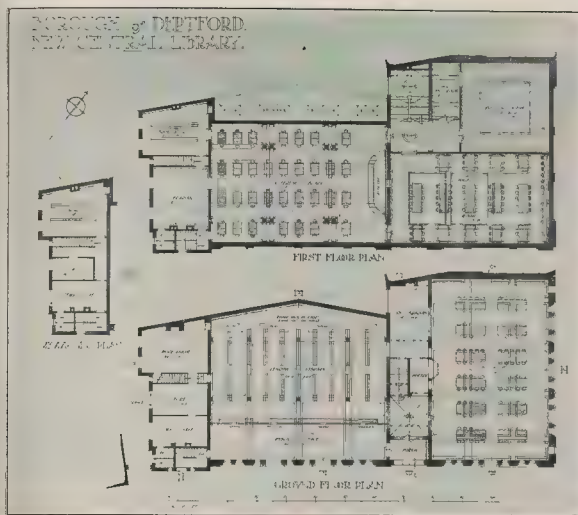

of teaching it has its apologists, one must confess; by many of those whose opinions really count it stands condemned. But let any who feel inclined to associate themselves with its antagonists reflect that the movement (it is perhaps too firmly rooted in matter-of-fact acceptance now to be called a movement) has afforded innumerable opportunities for learning which might otherwise only with difficulty have been obtained; on the other hand, it may be argued that facility of access may be too pronounced. And so on indefinitely, with innumerable arguments—a case, for one side or the other, being made in the usual way by uttering half of them. We leave the methods to those immediately interested—our concern is with the results.

At the exhibition of works rewarded in the National Competition it is interesting to observe once more that the brighter sections are those by their nature least influenced in their course by the schools. The examples of illustration, for instance, in black and white or in colour, show not only a more complete measure of achievement (natural enough in that, granted talent, no long labour is

required), but also an alertness, individuality, and life, which, combined with the knowledge that, except in matters of technique, the school has not, necessarily had any hand in it, leads one to the view that this possibility is perhaps the reason of such marked superiority. On the other hand, such productions as (to make use of a sort of generic title) "designs based on a plan," in which "South Kensington," with its pseudo-scientific botanical study has fuller play and more direct influence, are for the most part desperately dull and uninspired. "Nature study" is of very little use to those on whom the affluat does not descend; tradition is, however, with its appeal to all the associations of culture. It is therefore pleasing to observe that traditional forms are gaining fast, and may soon entirely oust the strugglers *ab initio* from the field. In lace-work, which has suffered much, this tendency is marked and especially pleasing. Indeed, in all the smaller matters of design, those directions in which "South Kensington" formerly held strongest sway, "South Kensington" is being slowly thrust out. Designs for book-covers, embroidery, plasterwork, fabric, and all the little things to which this style may be applied, show more and more that tradition is coming back to its own; and the many examples entitled "Study of the Historic Styles of Ornament" indicate that this return is being encouraged. But there is much more to be done in what would a short time ago have been considered this retrogressive direction before any real advance can be made. Technical ability, often surprisingly precocious (notably in two gold medal jewellery exhibits—we hope age is not taken into account by the judges) is sometimes buried in design which does not deserve a second glance. In no case, naturally, does the design outstrip its execution—if one may in one's mind predicate the possibility of a separation of the two. They are most happily worthy of each other perhaps in the encaustic work submitted by the schools in the Potteries district. Turning, however, to those realms called pure art as opposed to applied (or rather to the technical preparation for it, for hardly any of the exhibits are anything but essays in technique), we find ourselves (for just that reason) unwilling, and perhaps unable, to deliver an opinion (necessarily on technical points) of any value. But what one may say concerning the painting and the sculpture in the course of a consideration of "South Kensington" is that, though at certain schools these arts may be very well taught, at none of them, as far as a spectator can tell, is there an atmosphere permitting the desirable *flair*; that "South Kensington" as an environment tends to suppress

Third Premiated Design, by Mr. Henry T. Hare.

Deptford Library: Alternative Design, by Mr. Henry T. Hare.

ecture—in those directions of decorative art with which "South Kensington" concerns itself most directly, that is to say—the impression given is merely that of an extension of the other exhibition, of considerable technical ability, with here and there individual merit, but no indication of any definite tendency or exceptional power of personal direction. The coloured glass seems sound, except for an inclination to studied awkwardness of leading (of a fine fitness at times, as in the case of the little three-piece light of the head by Botticelli). There is some pleasing pottery, woodcarving, metalwork, and embroidery of the customary type—taking our impression as a whole. Lettering is good, as it usually is in these days, but manuscript and illumination should be embarked upon seriously, if at all. We find nature study tiresome.

Whether the improvement in the amount of knowledge of architectural detail in the section devoted to "room decoration" is due in any measure to our animadversion last

Deptford Library: Third Design, by Mr. Henry T. Hare.

year or not we are unable to say. It would please us to think so, and afford hope and encouragement to the expression of our view that the improvement can and will continue. There are still exhibits at which the trained architect would laugh, and the colour schemes are often unpleasantly emphatic. It is not enough, too, that thorough knowledge of the grammar of architectural design should be applied to the walls and static features of an apartment. A room should be conceived as a whole replete and harmonious in every particular, even perhaps, in the German fashion, to the size, shape, and tone of the pictures upon the walls.

In the architectural section for the first time in all our peregrination do we find evidence of definite teaching and assured direction. The exhibition is restrained in quantity because from what one knows of the way in

Deptford Library: Alternative Design, by Mr. Henry T. Hare.

which the R.C.A. student works one is aware that only a very small proportion of the work done is shown, and in kind because of the strictness with which the more severe methods of Italian Renaissance design are adhered to. The exceptional facilities afforded by the adjacent Museum are fully used, especially as regards the coloured models of Italian interiors with which it is so well stocked. And the result under Professor Pite is a strongly Italianate style of design, carefully and often remarkably drawn, and freshened with touches of the individual neo-Grecque which the Professor has at times used in his own practice.

Little space remains to us in which to deal with the painting. As is to be expected, the larger essays in decorative painting in point of vigour of colour and design fall as far short of the students' own sketches as of the high measure in these matters attained in Professor Moira's own work. Indeed, we would have expected to see his influence more directly apparent. It is in the monthly sketches of given subjects, interesting and very enjoyable as pictures *sans arrière pensée*, with their very highly-developed feeling for composition, that the effect of the personality of the Professor is felt.

THE ROYAL SANITARY INSTITUTE CONGRESS, BELFAST. ENGINEERING AND ARCHITECTURE.

The following is the conclusion of our report of the congress of the Royal Sanitary Institute, which has just been held at Belfast. The report was commenced in our issue for July 28, p. 98, and continued last week on p. 127:—

Artificial Lighting of Hospitals.

Mr. John Darch in discussing this question said that in visiting the principal London and other hospitals he had been keenly struck with the universal want of discrimination in lighting. There was a kind of trade orthodoxy which cherished certain forms and fittings and decreed their use, often in defiance of common sense. There was to be avoided, on the one hand, the evils of glare, and, on the other, the risk of eye strain consequent on insufficient light, or upon the effort to see in the face of misguided lights. The value of illumination depended not on the amount of light that was shed throughout a room, but on that which was reflected for visible objects. An essential part, therefore, of any scheme of illumination was the colouring of walls and ceilings, the strength of which must be properly balanced with the amount of light available. Dark colours ate up the light, and were therefore wasteful. White ceilings, cornices, and friezes not glossy, with pale-tinted walls and slightly darker dadoes, would best serve the hospital and its inmates. The author, without entering into a comparison of the merits of various lighting media, proceeded to show by means of diagrams how lights should be placed so as to successfully illuminate every department of a hospital.

Mr. Leon Gaster congratulated the Institute on the fact that lighting was being taken up from the sanitarian's point of view. He also pointed out that the French Government had recently appointed a committee, consisting of doctors, architects, and engineers, to consider and report to the Public Health Department on the conditions of different illuminants and their hygienic aspects, etc. He expressed the hope that the Home Office of this country would take the matter up.

Major Blackman referred to the bad lighting of barracks and regimental institutes, and thought it was essentially a matter on which the Government ought to take some action.

Mr. E. T. Hall criticised some of the diagrams of the author, and said his preference was for a light 2 ft. from the wall, but suspended from the ceiling.

Planning of School Classrooms.

Mr. W. R. Webb (Licentiate R.I.B.A.) said the chief object to be borne in mind in the planning of the classroom was to secure the concentration of the scholar on his work, and to afford the teacher complete control of the classroom, isolated and independent,

without communication of any kind with the adjoining classrooms. In this respect the general practice in Continental schools was a striking improvement on that of many English examples, in which glazed doors and glazed movable partitions between the

FIG 1. ENGLAND

FIG 2. FRANCE

classrooms were much too freely introduced. Figures Nos. 1, 2, 3, and 4 were common types of school classrooms in England, France, Germany, and Switzerland, and show at a glance the different methods of arrangement of desks and the shape of classrooms.

FIG 3. GERMANY

FIG 4. SWITZERLAND

The length of the classroom should be determined by the acuity of vision of the scholars and the vocal energy of the teacher, and the width should be limited by the application of the rules governing the lighting. The application of these two rules had

resulted in the adoption in nearly all countries of a rectangular classroom, having length and width in the proportion of 3 to 2 or 5 to 3. The height of a classroom, which should not exceed 13 ft., was determined by the question of acoustics and cost. Many Continental authorities considered that the width of a classroom should not exceed one and a half times its height, which view was confirmed by Dr. Kerr, of the London County Council, who had recently stated that classrooms should not exceed 20 ft. in width. If the suggestions contained in the report of the recent Departmental Committee of the Board of Education on the cost of school buildings were adopted, buildings of the permanent type might be designed by the architect in the various methods of reinforced brickwork or concrete, so successfully employed in other structures; and for those division walls between classrooms, clinker breeze, hollow and solid concrete partition blocks offer considerable advantage in regard to facility of construction and economy in cost. The use of glazed brick dados, which are in any case open to many objections, would not be practicable with walls of this description; glazed tiles, which, however, were open to similar objections, could be employed if desired, but in his opinion the use of a cement dado was much to be preferred. The portions of the walls above the cement dado and the ceilings required to be finished with a plaster of a much softer description than that generally used, both for acoustic reasons and to prevent undue condensation. All the surfaces should be brought to as smooth a face as possible, with the internal angles between walls and ceilings rounded in the plaster. The colouring of the walls should be most carefully selected, as the value of reflected light from suitably selected tints could not be over-estimated. The most suitable tints for this purpose were those of the sage-green or eau-de-nil, containing a proportion of about two-thirds of body white. But the dados should, of course, be finished with a darker tint with a plain line band as border. Dealing with the various materials for flooring, the author advocated linoleum, the cost of laying which, he said, compared favourably with batten, parquet, or wood block floors. The economy with which cleaning and repairs could be effected were points of considerable importance. Many authorities in this and other countries agreed that the best aspect for classroom purposes from all points of view was that of the south-east. Unilateral left-hand lighting for classrooms was universally recommended and adopted, and the generally accepted rule of the window-glass area in relation to the floor area was in the proportion of 1 to 5. Recent investigations were convincing and conclusive that some means of thorough or cross ventilation by ample natural prelation obtained by external windows was absolutely essential for perfectly ventilated classrooms. The central system of supplying heat was one which should be recommended for all school purposes. Properly screened open fireplaces, in addition to the other means of heating, should, however, always be provided for the babies' rooms.

Considerable discussion ensued on the paper, which largely turned on the advantages of unilateral and bilateral lighting.

Irish National Schools.

In a paper dealing with the "Cleaning, Heating, and Ventilation of Irish National Schools," Mr. W. R. Maguire, J.P., pointed out that a large proportion of Irish national school buildings were dangerously defective, in bad sanitary condition, and devoid of any attractive comfort for either children or teachers, and he urged the necessity for more Government aid to deal with the defects. He said it would cost more to bring the majority of substantial school buildings erected thirty years ago, structurally sound, up to the standard of to-day than to build suitable modern schools. But where these fine buildings stand they must be utilised; the finer they are, architecturally, the more they cost to alter and adapt. The school architect, then, had to consider the problem of future demands for alteration and extension on one hand, and the possible abandonment of his structure at a future date, and so plan his building on simple lines. Architects are to a large extent called on to act as prophets in designing schools. School

buildings need not be palatial, but rather built for the comfort and benefit of children and teachers, well planned, sound, weather-proof, warmed, ventilated, lighted, easily cleaned and maintained for a reasonable period, sacrificing quite legitimately an eternal durability to the stern demands which limit first cost in this world.

Roads.

Discussing the evils of the dust nuisance and the remedies, Mr. J. S. Brodie (Borough Engineer, Blackpool) pointed out that where financial conditions were favourable the modern road-maker need have no difficulty in laying down a practically dustless road; but with existing water-bound road surfaces the difficulties to be overcome in the prevention of dust were vastly greater. He had found that the treatment of water-bound road surfaces with properly prepared tar compounds at a cost of from 1d. to 3d. per square yard was the most satisfactory under the local conditions with which he had to work.

Mr. J. Parker (City Surveyor, Hereford) submitted a paper on "Tar Macadam," and discussed the various forms of tar construction at present in vogue. The cost of tarmac in Hereford during the past eight years had varied from 1s. 3d. to 2s. per square yard; steam-rolled ordinary macadam being 1s. 3d. to 1s. 7d. Tar grouting averaged 1s. 7d. per square yard. Tar painting had been done as low as one-fifth of a penny; but the average cost, including the rolling in of Cleve Hill 4-in. and 4-in. clean screenings, was 14d. per yard.

Mr. H. F. Gullman described the Belfast tar macadam plant, the general features of which were as follows:—The stone supplied from the quarries is delivered at a high level to the drying towers. In its passage, by gravity, through the towers, the stone is thoroughly dried and heated, and passes out at the lower end into a revolving mixer. Boiling tar, of sufficient quantity to thoroughly coat the stone, is also fed into the mixer, and the whole discharged at the outlet, thoroughly mixed, in the form of tar macadam. With a staff of one foreman and five men the output of tar macadam is upwards of 150 tons a week.

Several speakers followed in the discussion, and gave experience of the different systems of tar spraying or painting they had tried, with more or less success, for dealing with the dust nuisance.

Smoke Abatement.

Several papers were read in the different sections dealing with the subject of the smoke nuisance and its abatement, when the use of smokeless fuel, gas, and electricity was strongly urged. Mr. J. Macaulay (Chief Smoke Abatement Inspector, Liverpool), who read a paper before the Sanitary Inspectors' section, advocated the use of more fire-brick and less iron in the construction of domestic chimney places, and said that chimney flues would offer less resistance to the ascending gases if lined with smooth fireclay pipes, properly jointed, than they do now with the rough angular projections formed by the ends of bricks, which make the cleaning of the flues an impossibility.

Discharge of Sewage into Tidal Waters.

Mr. W. Harpur (City Engineer, Cardiff), in introducing the above subject, gave details of an outfall sewage scheme, discharging into the Bristol Channel, which he had carried out, and which had after fourteen months' working proved very successful. If observations as to the safe conditions for discharging sewage into tidal waters were carefully made it would be found that while in certain cases crude sewage might be discharged at all times of the tide, in other cases it would be found necessary to store the sewage in suitable reservoirs and discharge only at certain hours of each tide, while in extreme cases, as at Belfast, it might be found even necessary to pass the sewage through sedimentation tanks, and then to discharge it only at certain periods of the tide, and these conditions he was of opinion were the extreme that was in any case necessary to ensure perfect safety to the community, where suitable points of discharge under proper conditions were available.

Professor E. A. Lister, as the result of investigations into the chemical principles involved in the discharge of sewage into

tidal waters, practically endorsed the conclusions arrived at by Mr. Harpur.

Dr. Fowler (Manchester) warned engineers against the employment of disinfectants, such as chloride of lime, etc., as in attempting one thing they might get into a worse state of things.

Mr. Cotterill (Bristol) emphasised the importance of dealing with each case on its merits, and said that Mr. Harpur's scheme at Cardiff furnished a case where no injury could arise, and another instance was that of Torquay.

Mr. Barker described the methods adopted at Portsmouth, where the crude sewage was discharged into a large volume of water which passed out of the harbour at a rapid rate.

Mr. A. J. Martin agreed that drastic safeguards against disease germs might do far more harm than good if they upset the balance of nature.

Incompetent Engineers and Architects.

Mr. P. C. Cowan (Chief Engineering Inspector of the Local Government Board for Ireland), who presided over the sitting of the Conference of Municipal Representatives, dealt with the law in force in Ireland with regard to engineers and surveyors, and said in some respects it was more favourable than the law in England. The absence of provisions in the statutes to prevent incompetent persons from acting as engineers and architects was much to be regretted, and doubtless accounted for the low estimate often put on their services. It was a matter which could be more easily dealt with than the wider question of registration of engineers and architects, and the thin end of the wedge had been inserted by the provisions of the Labourers Act of 1906, which laid down rules as to the persons who should be deemed eligible for employment as architect, engineer, or surveyor. He ventured to think that the time was now opportune for legislation which would protect engineers and architects from unfair competition, and the public from the very serious loss which now arose from their displacement by practitioners who were not qualified. There was now a sufficient supply of properly-trained men, and no good reason why the safeguards afforded to the practice of law and medicine should not be extended to those whose function was "the art of directing the great sources of power in Nature for the use and convenience of man."

If the Institutions of Civil Engineers and the corresponding Architectural Associations and the Universities were to combine in an effort to secure proper recognition of the professions of engineering and architecture, success would ere long be obtained.

National Sanatoria.

Mr. E. T. Hall, F.R.I.B.A., gave the paper he had prepared for the Engineering and Architectural Section as a popular lecture on the closing evening of the Conference. He said that "National Sanatoria" was now proposed to be recognised as a national obligation, whereas hitherto it had been left to private charity. The author gave some details of the number of consumptives in the country, and remarked that the sanatorium in a nutshell was the embodiment of the root idea of open-air treatment under medical supervision. There was much to be considered in the selection of a site for a sanatorium. First of all, in considering competing sites they must ascertain the average number of hours of sunlight to which they were subject, and give preference to those with the best record; next, learn the relative humidity of the air from local causes, and note that site which had least. A great altitude was of no importance. What was important was that the site should be open to the winds of heaven, that was to say that there should be free currents of air all round and through the buildings, that there should be abundant access for sunlight, and it should be cheerful. To attain these ends the site should be elevated above the land to the south, and on the colder sides it should be protected. But here a note of warning was necessary. By many a dense belt of woodland quite close up to the building on the northern and eastern sides had been encouraged. That was a mistake. Trees should be cut back to a considerable distance, and avenues should be made through them to allow great rivers of air to sweep through and around the

buildings. Prospect was of great importance. Shut in by woods or other limitation of panorama, a feeling of depression was engendered which was greatly to the detriment of patients. Extensive views, on the other hand, broadened the outlook not only of the physical eye, but of the mental vision. Subsoil was of importance. Clay as a subsoil was liable to get waterlogged, with resultant mists from evaporation. Gravel pockets in a general clay formation were not good, because the subsoil water became stagnant and gave off noxious gases. Loose sand on the surface was worse of all, the gritty brittle particles blown by the winds were great irritants to the respiratory organs. A rocky soil was best, so long as it had a verdant supersoil. The greensand formations were good, and pine-trees flourish on it with their resinous perfume. The buildings should be set well away from all dusty roads. As to the type of building itself, much had been said and written as to the relative advantages and single and multi bed wards, of isolated huts and congregated rooms. Single huts were reasonable were few patients had to be treated. The one-room habitation was primitive, whether it be of wattle, of canvas, or of boards; but if a large number of people were to be housed, fed, and supervised, and were to have the amenities of prospect and open surroundings, their huts would cumber the ground, and their abodes must be brought together so as to leave the necessary open spaces. This eventuated in a large building, or might be series of buildings, where apartments for patients were convenient of access from the administration, where baths for washing and for hydrotherapeutic treatment, and sanitary accessories might be disposed for general convenience, and where drainage might be concentrated and minimised.

If this be admitted as the necessarily practical development of the aggregation of sick persons, as in its essence it accounted for the formation of towns, then he thought it would be fair to say that public sanatoria which had to deal with the masses should be started on the lines in which, as they became larger, they must develop. Practically all the sanatoria dealing with any considerable number of patients abroad or at home were on the concentrated principle.

The author proceeded to discuss the question of planning, and said that he felt sure from his own investigations and from conversations with medical superintendents that the large majority of rooms should be single bed, but that a few of two, three, and four, and perhaps five, might be of advantage. Large wards were to be deprecated. It was manifest that cost was an element of great importance when large numbers had to be dealt with; that the prevention of fire was another. The cost per bed varies naturally in relation to accessibility of building material and cost of labour. Sanatoria in England, built of brick and stone as distinct from temporary wooden structures, ranged from 350l. to 1,000l., and it was said in one case to be nearer 2,000l. per bed. In cases where local material was not available, when the distance from a railway was considerable, and where the institution is a large centre, self-contained, perfectly equipped, and built on up-to-date hospital lines, providing its own water, electricity for power and lighting, its heating and hot-water installations, its laundry full of machinery, engine and boiler house, kitchen, etc., fitted with labour-saving plant, ovens, etc., stores, recreation-room, workshops, research laboratories, mortuary and post-mortem rooms, an elaborate system of drainage, residences for medical and nursing staff, servants, gardeners, etc., he did not think 500l. per bed was excessive. These central institutions were necessary, and filled a definite place. But the sanatoria under the Insurance Bill could not be of the same elaboration. They ought not to be of boards (that material was far too dangerous in a wooded district), but might be, *pace* all by-laws, of a permanent character, one story in height, with walls and roof 3 in. or 4 in. in thickness, without elaborate foundations and all the cost these entailed. As a result of a lot of study, he showed on the walls designs of sanatoria of various sizes which he believed could be erected on a suitable and fairly accessible site for 100l. per bed. He had standardised every part of the construction as well as the eight-bed units of wards, the units of administration and of residence. The two latter were made

proportionate to the number of beds. If a sanatorium of sixteen beds was erected it could be increased at any time to thirty-two or forty-eight or sixty-four or more with a corresponding increase in other departments, without pulling down the old. A laundry was provided at the north. The enclosing material, including floors, was of non-combustible slabs of standard size, impervious to vermin and readily fitted together. A pure water supply was, of course, a *sine quâ non*, and if no public gas supply was available a small plant could be installed for heating baths, for cooking, and for lighting. Fire-places of special design to avoid dirt were adopted, to avoid the great expense of an engineering plant. Earth closets could be used if the site was in a rural situation. The drainage would then be of soiled water only, taken to cesspools, emptied by suction carts as at Nordrach, and distributed on the agricultural land. If a small establishment of sixteen beds was in contemplation, a qualified matron and nurses would be supervised by a non-resident physician. For thirty-two beds, quarters were provided for a resident medical superintendent. For forty-eight provision was made for two resident doctors, with a matron, a housekeeper, and, of course, a larger staff of nurses and servants.

It was suggested that, as at Frimley, patients should not only be trained to make their own beds, but to do all kinds of other work, such as digging and planting, carpentering, painting, etc., so that the maintenance would be reduced to a minimum. In all essentials it would be seen that the design comprised everything that was found in the larger and more costly sanatoria. All rooms faced south, south-south-east, and south-south-west. Each unit had six single-bed and one two-bed ward, with a sanitary annex and linen store. Each unit was detached from its neighbour, allowing for classification and avoiding the spread of fire in the possible event of carelessness. All rooms were accessible at the rear by a covered verandah, and had a terrace in front covered at discretion, either by a glass roof, or, as at Frimley, by canvas shop blinds. A common dining-room was in the central block, close to the kitchen and stores. The whole scheme was one for open-air treatment in the fullest sense.

The Most Rev. His Grace the Lord Archbishop of York has consented to accept the office of President of the Twenty-seventh Congress of the Royal Sanitary Institute, to be held in York in July, 1912.

THE ROYAL ARCHÆOLOGICAL INSTITUTE IN SOUTH WALES.*

On Friday, July 28, an excursion was made by rail and motor-cars to Coity Castle, which was described by Mr. Hope. It consists of a pear-shaped inner wall, originally encircled by its own ditch, and containing all the principal buildings, as well as a curious semi-detached round garderobe tower projecting from its southwards from behind the hall and lodgings. There is a gatehouse on the north-east, and the remains of another on the west that communicated with the outer ward. This seems to be an addition to the first plan, and is roughly oblong in plan, with a gatehouse in its western end. The whole of the castle buildings are mainly of the XIIIth century; but everything is now in such a hopeless state of ruin that it is difficult to find architectural details from which dates may be deduced. Some interesting details concerning the successive owners of the castle were contributed by Mr. Hynd Nichol. Coity Church, which adjoins the castle, was next visited, and described by Mr. Brakspear. It is a small aisleless, cruciform building with a tower over the vaulted crossing, all of early XIVth century work. In the north transept are two charming little XIVth century effigies of Tueberville children—a boy and a girl. In the chancel stands a five-gabled oak cupboard of late XVth century date, ornamented with emblems of the Passion. The journey was next continued to the church at Coychurch, which resembles that of Coity in plan. It has a fine lofty arcade to the nave, with good open roof, with panelling in the first bay over the place of the roof-loft. In the north transept is an interesting effigy in cassock and surplice of Thomas Evans, clerk, "parson of this church,"

1591, and a late XIVth century effigy of a layman. After luncheon at Bridgend a visit was paid to Ewenny Priory Church, which was described by Col. Tueberville. The priory was founded early in the XIIIth century by the lords of Ogmere, one of whom, Maurice of London, gave it as a cell to Gloucester Abbey in 1141. The church of that time, which alone survives, consisted of a vaulted presbytery, north and south transepts, each with two eastern chapels, a low middle tower, and a nave with north aisle only. The north transept and all the chapels are now ruined. The church was both parochial and monastic, and there still stands under the western arch of the crossing the screen wall against which the nave altar was placed, with procession doors at either end. Mr. Hope pointed out that the XIVth century wooden screen now under the eastern arch could not possibly be in its original place, which was across the nave at the second bay, where the grooves for fixing it still exist in the pier. Mr. Hope also showed, from the position of the various doorways, what was the old arrangement of the eastern arm prior to the suppression of the priory. The church contains an extensive series of incised slabs and early monuments. The priory precinct was fortified by a wall and towers in the XIVth century, and is still entered by two of the original gatehouses with alterations of the later date. The party subsequently returned to Cardiff. At the evening meeting Mr. W. H. St. John Hope gave an account, illustrated by lantern slides, of the extensive excavations carried out in 1909 and 1910 by the Society of Antiquaries at Old Sarum. These had brought to light the remains of the castle that once occupied the site, including a curious postern-gate and tower and a keep of remarkable plan, with an unusual series of garderobe shafts. The works are still in progress, and will probably be spread over a number of years.

On Saturday, the 29th, the party first went by train to Pyle, and thence by motor-cars to Margam Abbey. This was described by Mr. Brakspear as having been founded for Cistercian monks by Robert, Earl of Gloucester, about 1150. Part of the nave of the first church, with simple round-headed openings for its arcades, remains, and is still used for service. The transepts and presbytery were rebuilt on the same plan as the Tintern in the XIIIth century, but are much ruined. Of the romantic buildings nothing is left but the foundations of the eastern range, with the bridge to the rood-chester, and the shell of the chapter-house. This stands clear of the range, through which it is approached by a vaulted vestibule, and was round within and polygonal without. The vaulting, which sprang from a central pillar, fell in 1774, but the building is otherwise fairly perfect.

The contrast between the sylvan surroundings and beautiful gardens of St. Mary Talbot at Margam and the blackened and sordid site of Neath Abbey, which was next visited, is remarkable. Otherwise the remains of Neath Abbey are even more important. According to Mr. Brakspear, who again acted as guide, the abbey was founded about 1130 by Richard de Granville for monks of the Order of Savigny, but the buildings date from the XIIIth century. To this period belong the considerable remains of a church of the Tintern type, with all its parts vaulted; also the western range of buildings and much of the doister range, with its vaulted undercroft and bridge to the rood-chester, like Margam. The buildings owe their preservation to their having been converted into a manor-house at the suppression by Sir Peter Holby, and considerable remains of this exist. The sites of the church and cloister would well repay excavation if properly carried out. Later in the day the journey was resumed to Tenby, in readiness for the second part of the meeting in the district about that town.

The proceedings at Tenby began at 10 a.m. on Monday, July 31, at the Town Hall, where the Mayor (Captain Hughes-Morgan), in his official robe and chain, and supported by the aldermen and councillors, with the attendant sergeants-at-arms, formally welcomed the Institute on behalf of himself and the Corporation. The party was then conducted round the town by Mr. Edward Laws, who described the remains of the Norman castle and of the walls, towers, and gates built about the town, probably by William of Valence, Earl of Pembroke, about 1288. Much rebuilding of these was carried on during the XVth and XVIth centuries, but a good deal has since been destroyed, particularly on the two sides next the sea. At noon the party

again assembled at the Town Hall, to join, by special invitation of the Mayor, in the state procession for the annual opening of St. Margaret's Fair and the Pie-Powder Court in connection therewith. Headed by a brass band, and preceded by police constables, the procession of Mayor, Corporation, mace-bearers, and archaeologists, with divers townsfolk, wended its way through the principal streets to the scene of the Fair in St. John's Croft, with occasional halts while the crier proclaimed the Fair and Court open, in accordance with the charter of Queen Elizabeth.

After lunch a visit was made by sea to Caldey Island, where Mr. J. Coates Carter acted as guide. The little church used by the islanders was first inspected. It consists of a square nave and a chancel of smaller size, all of the simplest possible character, and Mr. Hope said he saw no reason why the pre-Norman origin claimed for it should be disputed, though little architectural evidence existed except part of the west doorway. Hard by are the modern buildings of the abbey of the English Benedictines, established then by charter of the Archbishop of Canterbury, and whose fame has brought the island into special notice. The old buildings of the small Benedictine priory that existed here until the suppression were described by the Rev. W. Done Bushell, to whose residence they are annexed, and are of special interest not only from their small size, but as having been the first home of the Benedictines on their re-establishment on Caldey Island. They comprise an aisleless church of the XIIIth century, with vaulted quire, and western tower and spire, with a small cloister on the north, with a western gatehouse, and much of the eastern range. In the church is the famous Caldey stone, with its Latin and Ogam inscriptions. The party subsequently re-embarked for Tenby, after an enjoyable afternoon. The evening was filled by a conversation given in honour of the Institute by the Mayor and Mayoress of Tenby, at which the valuable series of charters given to the town was exhibited, as well as the two silver maces and the records of the old manorial courts. A number of prints and objects of local antiquarian interest were also exhibited by Mr. Edward Laws and Miss Eli-Edwards.

[To be concluded in our next issue.]

GENERAL NEWS.

Professional Announcement.

The office of Mr. Edw. Dru Drury, District Surveyor, will in future be at Parliament Chambers, No. 14, Great Smith-street, Westminster, S.W. Telephone: 1587 Victoria.

Hampton Court Palace and Precautions Against Fire.

The Office of Works have taken steps to greatly improve the means and appliances for dealing with any outbreak of fire in the Palace, and have thoroughly overhauled the water supply. They have installed a special fire alarm, which affords direct communication with the fire-station at Kingston, and have made arrangements with the Kingston Fire Brigade for rendering their prompt assistance if required.

The London Museum.

A movement is afoot for providing a suitable and permanent building for the collections which are now housed temporarily in the State apartments of Kensington Palace. The London County Council have agreed to offer upon permanent loan to the Trustees all the valuable and multifarious objects and relics which they have preserved and which are at present stored in the Horniman Museum at Forest-hill, in the County Hall at Lambeth; and in the Exhibition at Shepherd's Bush.

Decorations of the Royal Exchange.

Mr. F. O. Salisbury is appointed to paint the panel which Alderman Sir Charles Wakefield will present to the Gresham Committee. The panel, having for its subject the rebuilding of the wall of London by King Alfred the Great after the departure of the Danes, will be fixed in the ambulatory.

The British Pavilion, Rome Fine Art Exhibition.

We learn that the British Government have ratified an agreement to purchase the Pavilion of the British Section, with a view to the establishment of a permanent British Palace

* Continued from page 151.

of Fine Arts in Rome. The building was erected after the plans and designs of Mr. E. L. Lutyens, F.R.I.B.A., the general scheme being modelled, with the necessary modifications, after the façade of St. Paul's Cathedral.

The National Portrait Gallery.

A Government Bill is passed for third reading in the House of Commons which provides for the transfer from the War Office and vesting in the Office of Works some land that appertained to the St. George's Barracks, in order that it may be utilised for extensions of the National Portrait and of the National Galleries. In the case of the former the Trustees, in their fifty-fourth annual report, which has just been issued, direct attention to their existing urgent requirements for further room, and to a considerable extent, inasmuch as the available wall space is so completely occupied that it is almost impossible to find proper place for new acquisitions. In addition to engravings, photographs, and similar supplementary reproductions there are 1,605 registered portraits. In the year 1910 a total of 175,251 persons visited the Gallery.

The Road Board and Advances in Aid.

With the sanction of the Treasury a third batch of advances from out of the Roads Improvement Fund has been made by the Road Board to highway authorities and county councils. The advances amount to an aggregate of 11,000*l.*, whereof 6,600*l.* is for England, so that the total sum advanced in January-June last is 275,350*l.*, of which 209,890*l.* goes towards the improvement of road crusts, and includes grants in aid for macadam and surface tarring.

CORRESPONDENCE.

The King Edward Memorial.

Sir, By a happy inspiration Professor Adshead appears to have solved the difficulty of finding the site for the memorial to our late King. Professor Adshead's plan for placing the memorial at Hyde Park-corner provides a most appropriate site for it, and at the same time transforms what is now an ugly open space into one of beauty. Decimus Burton's arch on Constitution Hill, now so awkwardly placed, will be brought into symmetry with its surroundings, and Hyde Park-corner at last become worthy of London.

It is only necessary to place side by side Professor Adshead's plan and a plan of the area as it now is to at once realise the vast improvement which would be effected by

carrying out the proposal. Probably there never was another proposal for so great a Metropolitan improvement realisable at so moderate a cost.

MARK H. JUDGE,
Honorary Secretary of the Further Strand Improvement Committee.

Gidea Park Competition.

Sir,—Apart from the question raised by Mr. Webb in his letter regarding the desirability of architects entering into competitions involving building, he seems to be under several misapprehensions in the matter of the above competition. Surely he does not imagine that the 140 or so architects bought the land and built houses solely on the chance of obtaining one of a few prizes. There was, indeed, the chance, but for the bulk of the competitors it was a small one, and without any doubt the competition was regarded as a building speculation.

Mr. Webb's letter gives the impression that the charge for opening houses and watering gardens is a compulsory one. This is not the case, and it is purely optional on the part of competitors whether they avail themselves of these arrangements.

Again, it is optional for competitors to employ the company to act as agents for the sale of their houses, and the handsome consideration referred to by Mr. Webb is the ordinary agent's commission.

Speaking as a competitor, I know from experience that the company have been most helpful to competitors, and have assisted them in every way. The competition was organised as a business transaction, and competitors have entered it as such with their eyes open.

CHARLES W. YATES.

Deptford Central Library Competition.

Sir, Can the award as regards the first premiated design in the above have been made regardless of the conditions attached to the competition? To me it appears undoubtedly so.

For instance, the newsroom in this plan is without supervision of any kind, while it was distinctly required by the conditions that the lending library and the attendant's lobby should both supervise this room. Again, the sub-librarian's room, as now planned on this scheme, is impossible for the use intended.

Many other conditions have been ignored in a manner which suggests to me that this award is unfair to those competitors who regarded the conditions as governing the competition, and submitted their designs in accordance therewith.

There was a distinct clause in the conditions by which any designs not conforming to

them would be excluded. Comment is needless.

I may mention that I am not a competitor, nor have I interest with any of those who have submitted designs.

NONFUSED.

Architects and Shop Design.

Sir,—In your issue of March 24 you have a paragraph referring to the shopkeepers' objections to Mr. Norman Shaw's fine design for the rebuilding of Regent-street.

That the design is not a good one from a shopkeeper's point of view is apparent to any architect who has had experience in designing this class of building, but the same design, with a very slight modification, can be continued and give the shopkeepers all they desire—plate glass.

I think in the matter of shop design we Straits architects have solved the difficulty, as the enclosed tracing will show. We agree with the shopkeeper that the maximum area of shop window is necessary, but we never carry our heavy superstructure on plate glass and glazing beads, as is usual in Europe. As you will see, we put up a masonry structure with piers that appear capable of and do carry the weight of the building above. This is built out to the building line, and we then put in a plate-glass front, which is simply a huge showcase, some 5 ft. to 8 ft. back, and this looks exactly what it is—a fitting that can be moved in any way, as it does not carry, nor does it appear to carry, any weight.

This system has other advantages from the shopkeeper's point of view, as it gives the public a covered space from which to view the display, and saves the cost of sun-blinds. Of course, against this has to be placed small loss of area on the ground floor. The enclosed plan is not a lone example, but one that is always adopted here.

Singapore.

ARCHITECT.

Temple of Artemis.

Sir,—I notice two slight mistakes in the above article. The first should read 60 Greek ft. = 60 ft. 9½ in. English, and the second should be large dentils or square consoles.

A. E. HENDERSON.

INTERCOMMUNICATION COLUMN.

Rainwater "Tipper."

We hear that the "Roberts' rainwater separator is supplied by Messrs. Frederick Braby & Co., Ltd., Ashton Gate Works, Bristol.

"Architects and Shop Design."

EDITORIAL SUMMARY.

The leading article is entitled "Evidence in Private Bills" and has reference to the method of obtaining architectural evidence before Parliament.

Our second article, "The Architect as Builder," deals with the Gidea Park Competition (p. 154).

Notes (p. 154) include: "The Citadel of Aleppo"; "The Architect's Judicial Position"; "The Greater London Railway"; "Hyde Park Corner for King Edward VII."; and "The Traffic Question."

In this issue we commence a series of articles on "The Story of the Bridge," with illustrations (p. 155). One page of our plates is given in connexion with the article.

An illustrated article on the Deptford Library Competition appears on p. 156.

An article entitled "South Kensington" will be found on p. 158. It includes notices of the National Competition and the Royal College of Art Students' work.

Our report of the Belfast Congress of the Royal Sanitary Institute is concluded in this issue (p. 160).

Our report of the proceedings of the Royal Archaeological Institute in South Wales is continued this week (p. 162).

Correspondence (p. 163) includes: "Gidea Park Competition"; "Temple of Artemis"; "Memorial to King Edward"; "The Deptford Library Competition"; "Architects and Shop Design."

The Monthly Review of Construction (illustrated) contains: "Building in Canada"; "Notes on Some Definitions Used in Structural Mechanics"; "The Tower of Pisa"; "Reinforced Concrete Girders"; and Note (p. 165).

The Building Trade (p. 169) includes: "Australian Building and Labour Notes"; "Is Pointing in Brickwork Doomed?"; "Some Legal Questions about Extras"; "Building and Labour in Melbourne"; "Projected New Buildings in the Provinces"; etc.

Law Reports (p. 172) include: "Action by Contractor against Building Owner."

COMPETITION NEWS.

Deptford Central Library.

In connexion with this competition the Borough Council, at its meeting on the 1st inst., opened the award of the assessor, and it was found that he had placed Design No. 8 first, Design No. 7 second, Design No. 6 third. The envelopes containing the names and addresses of the competitors having then been opened it was found that the authors of the above-mentioned three designs were as follows:—

- No. 8 (first), Sir A. Brumwell Thomas, 37, Old Queen-street, Queen Anne's Gate, S.W.
- No. 7 (second) Castle & Warren, Amberley House, Norfolk-street, W.C.
- No. 6 (third) Henry T. Hare, 13, Hart-street, Bloomsbury-square, W.C.

Aixminster Cottage Hospital.

In the recent competition for a design for the new Aixminster Cottage Hospital, the scheme prepared by Mr. Leslie T. Moore, A.R.I.B.A., of 3, Raymond-buildings, Gray's Inn, W.C., has been placed first by the assessor, Mr. G. H. Oatley, F.R.I.B.A., of Bristol. The contract of £1,725, is being carried out by Mr. R. G. Spiller, of Chard, Somerset.

CONTEMPORARY ARCHITECTS AND THEIR WORK.

In our account of the life and work of Professor Blomfield, A.R.A., which appeared in the *Builder* of July 23, there are two errors:—(1) Professor Blomfield got a leaving exhibition at Haileybury, and a scholarship at Exeter College in 1875, not a "scholarship exhibition," as stated. (2) He went up to Oxford in January, 1876, and took a first in Greats in December, 1879, not 1870, as stated.

ILLUSTRATIONS.

On Loggia.

HERE are two supreme divisions of architecture, and as they are supreme so are they primitive, as they are eternal so have they their counterparts in the earliest life of the race. The first of these is the building of tombs, because men build tombs for their dead before they build houses for themselves, and the second is termed secular building to distinguish it from the first. All architecture is of these two kinds, of which the calm and the mound for the one and the plaited bower of branches for the other, are the basic nuclei.

But before man began to build at all and for long after that time, there remained, as the customary setting to all his deeds, the architecture of nature—"sylvan fancies" and "craggy fortresses," with which we may assume Eden was replete. It should always be kept in mind that structure beyond man's stature and not made by him for his use, was the first emplacement given by Jehovah; architecture as a setting to lives of natural leisure was the primitive intention of the gods. The conception of its only purpose was theirs, with the name we credit them in retrospect for it is the postulate condition of architecture that it shall have been made by man.

Now architecture lies in just that part of building those proportions, this form, that colour which is superfluous and superior to the mere necessities of the case, empirically considered. Your common fellow is right, from his point of view, and a sound critic in his estimate of architecture as trimmings and adornment; but there are not lacking even to-day, those who think the mere fact of building of little moment and an edifice of no account at all, unless its functions, by the agency of art, fashion its proportions and parts into terms of fitness, if not into forms of beauty.

It is in those kinds of building then, wherein the form is most nearly conditioned only by the significance it has to express and the beauty it must embody, that the purest satisfaction of Urania will be found and Clio will discover, since at this later year of grace she is come into her own—safest refuge, truest zeal, and steadfast satisfaction. The primitive division of building into two kinds still persists on the higher plane of art. And precisely in the proportion that its forms are supreme do examples enfold the embryo of the type. From the first cairn to the Pyramids, from them to Halicarnassos, from that to the Albert Memorial, or one more recent still, is but a flickering open of the eyelids of the mind.

Of all that pertains the gods and to the state of death their realm, the cairn is still in fact the purest art. And as for the sylvan

bower, in that which is nearest still to its early use, in these sad days the Loggie are dead. Commerce and Calvinism—two corbies—have plucked their e'en. Tangled terrace makes their ditch, arch and shadow are their breast-

A Loggia.

plate, arabesque their damascene; sonnets are their vanished valour. Not the Loggia di Lanzi—that's the agora of the Hellene or the atrium of the Roman, not a loggia at all. As well "the Street" in New York City or Threadneedle-street in ours. For these places have their uses, contrary to the precepts of the gods. No, the loggia is private, intimate and undisturbed—its shades and vaulting coloured with the fragrance of the lute. Careless are those who are in it and forgetful of all but themselves. For this is not Olympus, which is more a belvedere. It is like the earliest garden, but nothing like so tiresome. Apex of the centuries—its floor is strewn with only the peel of apples from the tree.

WINCHESTER CATHEDRAL RESTORATION WORKS.

The Dean and Chapter have presented a silver rose bowl to Mr. W. B. Walker in testimony of his services during the past six years upon the restoration works at the Cathedral. Mr. Walker, a diver, on the staff of Messrs. Siebe, Gorman & Co., of Lambeth, working in absolute darkness in 20 ft. of water, succeeded in gradually excavating the peat at the foundations and in spreading cement, which was lowered to him in bags. Pumping operations were discarded through fear of drawing the sand and silt away from other parts of the foundations, and the use of artificial light was found to be impossible. Mr. Francis Fox, C.E., in diving dress, examined from time to time the progress of the work.

MONTHLY REVIEW *of* CONSTRUCTION.

BUILDING IN CANADA.

As an example of the manner in which the rapid development of Canada forces building under difficulties, the illustration on this page is interesting. The building in question is a branch of the Canadian Bank of Commerce at Fort William, Ontario. The principal façade fell to be built in the winter months, and was consequently subject to temperature at times as low as 40 deg. below zero.

In this case the rear and side walls were already built and their openings closed. The area of the front with a due allowance of working space was enclosed by a hoarding to its full height. The permanent heating system was roughed in at an early state, and the building heated by temporarily-placed radiators, with the result that the work proceeded independently of atmospheric conditions. Needless to say, plaster work can be proceeded with by the same means. Conditions do not always call for this system of enclosure. Much work can be done in the open in fairly severe frost. Concrete work is executed, for instance, with the sand, gravel, and water all heated in an old boiler or cylinder, and the resulting work is found to be quite sound, as the cement is set before the materials are sufficiently cooled to freeze.

NOTES ON SOME DEFINITIONS USED IN STRUCTURAL MECHANICS—(Contd. from p. 45).

BY PERCY J. WALDRAM, F.S.I.

MODULUS OF ELASTICITY AND DEFLECTION.

Cantilever Concentrated Load Uniform Flange Stress.

In the last article (see *Builder*, June 14, 1911, page 45) it was shown that the greatest deflection (Δ) of a cantilever would be correctly expressed by multiplying the area (G) of a diagram of flange stresses by 2 and by the distance (X) of the centre of gravity of that area from the point of greatest deflection, and dividing it by the depth (D) of the cantilever and the modulus of elasticity (E) of the material or $\Delta = \frac{2GX}{ED}$.

This solution can be applied to determine the deflection of parallel beams and cantilevers as follows:—

First, take a cantilever in Fig. 5 with flanges proportioned to give a uniform flange stress. The flange stress diagram will be a rectangle—its area (G) will be fA , its leverage

X will be $\frac{1}{2}l$, and $\frac{2GX}{ED}$ will, in this case,

be represented by $\frac{2fl \times \frac{1}{2}l}{Ed}$, or $\frac{fl^2}{Ed}$.

If we want to represent this in terms of load (W), then f = the bending moment \div the flange area and depth, or $\frac{Wl}{Ad}$ and the

$$\text{deflection} = \frac{Wl^2}{EAd^2}$$

Cantilever Distributed Load Uniform Flange Stress.

If the load W had been distributed then both f and the deflection would be half these values when expressed in terms of W .

Cantilever Uniform Section Concentrated Load.

Next take a cantilever of uniform section as Fig. 6 loaded at one end. The area of the stress diagram in this case will be $\frac{fl}{2}$, the distance of its c.g. from B will be $\frac{3}{4}l$ and $\frac{2GX}{ED}$ will be represented by $\frac{2fl}{3Ed}$,

or expressed in terms of the load W ; $f = \frac{Wl}{Ad}$

$$\Delta = \frac{1}{3} \frac{Wl^2}{EAd^2}$$

Cantilever Uniform Section Distributed Load.

Next take such a cantilever loaded with a distributed load as Fig. 7. In this case the diagram of stress intensity is traced by a parabola. The area of it (obtained from the particulars given in Fig. 8) would be $\frac{2fl}{3}$, the distance of its c.g. would be $\frac{3}{4}l$

and $\frac{2GX}{ED}$ would be $\frac{2fl}{3} \times \frac{3}{4} \times \frac{1}{Ad}$ or

Canada Bank of Commerce, Fort William.

Mr. Victor D. Horsburgh, A.R.I.B.A., Architect.

FIG. 8

$\frac{6f^2}{12Ed}$ or $\frac{f^2}{2Ed}$ f in this case would be $\frac{WL}{2Ad}$ and the Δ for any distributed

load W would be $\frac{W^2}{4EA d^2}$.

Obviously the deflection in any kind of parallel cantilever can be expressed in simple terms of load, span, depth, flange area, and the modulus of elasticity of the particular material of which the cantilever is constructed.

Girder Uniform Section Concentrated Load.

Fig. 9 shows a girder under a concentrated load. This may be considered as two cantilevers back to back fixed in the centre against the downward bearing load and loaded with the end reactions of $\frac{W}{2}$, the central deflection being equal to the deflections of either cantilever.

In this case the area of the stress diagram $G = f \times \frac{l}{2} \times \frac{1}{2} \times \frac{l}{4} = \frac{f l^2}{8}$, the distance of its c.g. from the point of greatest deflection at the bearings, would be $\frac{2}{3}$ of $\frac{l}{4}$ or $\frac{l}{6}$ and

$\frac{2GX}{Ed} = \frac{2 \times \frac{f l^2}{8} \times \frac{l}{6}}{Ed} = \frac{f l^3}{24Ed}$. If $f = \frac{WL}{4Ad}$, then the deflection expressed as

before in terms of $W = \frac{WL}{24EA d^2}$.

Girder Uniform Section Distributed Load.

The next case is that of a girder loaded with a distributed load W (Fig. 10). Treating it in the same way as two cantilevers under a distributed load, we attribute the values in $\frac{2GX}{Ed}$ as before. G (the area of either

half of the stress diagram) $= \frac{3}{8} \times \frac{fl}{2}$, and the distance of its c.g. from A (X) $= \frac{5}{16} l$.

$$\Delta = 2 \times \frac{3}{8} \times \frac{fl}{2} \times \frac{5l}{16} \times \frac{1}{Ed} = \frac{5f l^3}{64Ed}$$

In this case $f = \frac{WL}{8Ad}$ so that the deflection in terms of W is

$$\Delta = \frac{5 \times WL \times l^3}{64 \times 8 \times Ad \times Ed} = \frac{5}{1024} \frac{W l^4}{EA d^2}$$

Girder Uniform Flange Stress Distributed Load.

The next case (Fig. 11) is that of a girder with flanges proportioned to the load, giving a uniform flange stress under a distributed load.

The values of $\frac{2GX}{Ed}$ will be as follows:—

$$G = fl \quad X = \frac{1}{2}l \quad f = \frac{Wl}{8Ad}$$

$$\frac{2GX}{Ed} = \frac{fl \times l}{4Ed} = \frac{f l^2}{4Ed} \quad \Delta = \frac{W l^4}{32EA d^2}$$

Girder Uniform Flange Stress Concentrated Load.

It is obvious by inspection that in such a girder under a concentrated load the value of $\frac{2GX}{Ed}$ would be the same $\frac{f l^2}{4Ed}$ but

as $f = \frac{WL}{4Ad}$ then $\Delta = \frac{W l^3}{16EA d^2}$.

Each of the seven cases dealt with results in the term $\frac{W l^3}{EA d^2}$ multiplied by the varying figures $1, \frac{5}{1024}, \frac{1}{32}, \frac{1}{16}, \frac{1}{8}, \frac{1}{4}$, and $\frac{1}{2}$, which varying figures may be expressed as a constant C .

In the foregoing deductions the approximation Ad (flange area \times effective depth) has been used to express the section modulus for the sake of clearness. This should now be replaced by the more exact expression Z , so that the general formula would read

$$= \frac{W l^3}{EZ d} \times C. \text{ The term } d \text{ in this formula}$$

would be the full depth in rectangular and other sections which are symmetrical about their neutral axes. In such sections the flange stress f which causes the stretch setting up the initial gradient, is measured in the outermost fibres. For such sections, therefore, the formula can be further simplified, for $Zd = \frac{I}{d} \times d = 2I$ and $\frac{CWP}{EZ d} = \frac{CWP}{2EI}$, and if the foregoing values of C be halved, a new constant n ($= \frac{1}{2}C$) can be used with the formula $\Delta = \frac{nW l^3}{EI}$.

The values of n may be tabulated as follows:—

	Uniform Section	Uniform Flange Stress.
Cantilever concentrated load ...	$\frac{1}{8}$	$\frac{1}{4}$
Cantilever distributed load ...	$\frac{5}{1024}$	$\frac{1}{16}$
Girder central load ...	$\frac{1}{32}$	$\frac{1}{8}$
Girder distributed load ...	$\frac{1}{16}$	$\frac{1}{4}$

For T and other sections which are not symmetrical about their neutral axes the formula can be used in the same form. In the form of $\frac{CWP}{EZ d}$ the depth d would be twice the greatest distance (y) of the neutral axis from the outer fibres.

The fibre stress to which such a beam would be calculated would be that in the extreme fibres at the tip of the web, and the gradient setting up deflection would be determined by the stretch of these fibres \div the distance Y . This gradient would be just the same as that determined by the lesser distortion in the fibres at the top of the table \div the lesser

distance X . But as the lesser fibre stresses in the table of a T section is not calculated, therefore the lesser distance X is not used. The deflection is, in fact, precisely the same as that of a symmetrical section of a depth equal to $2y$ under the same flange stress, and is, therefore, calculated on precisely the same way. In the practical calculation beams the flange stress f is almost invariably calculated first, and when this is known the factors of load, section modulus, and bending moment can be disregarded, the deflection being merely determined by the span and depth, or $\Delta = \frac{1}{8} \frac{W l^3}{E d^3}$, p being a constant varying with the type of beam and method of loading. E for structural steel can be taken at 13,000 tons, and for a working stress of $7\frac{1}{2}$ tons per square inch the formula can be simplified to

$$\Delta = \frac{p l^4}{d^3} \quad \frac{7.5}{13,000} \div \frac{p l^4}{d^3} = 0.000576,$$

or if S in feet be substituted for l in inches —

$$\Delta = \frac{p S^4}{d^3} \times 0.083$$

p can be tabulated as follows:—

$$\text{Value of } p \text{ in formula } \Delta = \frac{p S^4}{d^3} \times 0.083.$$

Handy Formula for the Deflection of Wooden Beams.

If a rectangular beam of clean deal 1 in. broad and 1 in. deep be placed over a span of 1 ft. and loaded centrally with a weight of 1 lb., the deflection will be found to be in the neighbourhood of 0.003 of an inch. Any increase in breadth would decrease the deflection directly, and any increase in depth would decrease it according to the cube of such increase in depth.

If the load be distributed by applying it in the shape of flexible strips of lead the deflection for a 1-lb. load over a 1-ft. span would be about 0.0002, for a 2-ft. span 0.0016, and for a 3-ft. span 0.0054, etc., and any alteration of breadth and depth would have the same effect as in the case of the concentrated load. It is possible to obtain very useful handy formulae from the results of these experiments.

In everyday practice it is very frequently necessary to know for wood beams what is the load in hundredweights either concentrated or distributed which will cause a deflection not exceeding $\frac{1}{16}$ in. per foot of span or $\frac{1}{128}$ in. — the deflection which is usually considered to be sufficient to crack plastered ceilings.

This limit of deflection for a 1-ft. span would be represented by $\frac{1}{128} S$ or 0.021 S . With a beam 1 in. in breadth, 1 in. in depth, and 1 ft. in span, a deflection of 0.002 was caused by a distributed load of 1 lb. Had the beam been 112 lb. the deflection would have been about 0.224 in. In other words, for a unit span of 1 in feet, a unit breadth of 1 in inches, and a unit depth of 1 in inches, a unit distributed load of 1 in hundredweights causes a deflection of approximately $\frac{1}{128}$ in. per foot of span.

For any beam of clean fir, therefore, it can be assumed that the distributed load in hundredweights which will produce a deflection of $\frac{1}{128}$ in. per foot of span will be expressed by $\frac{bd^3}{S^3}$ in feet.

For concentrated central loads the result should be multiplied by $\frac{3}{8}$, and for hard woods the deflection may be taken for practical purposes as the same as deal.

The above handy formula can be further extended. We have ascertained that the load in timber beams which causes a deflection of $\frac{1}{128}$ in. per foot of span can be shortly put as $W = \frac{bd^3}{S^3}$, and we can similarly use the

FIG. 9

FIG. 10

FIG. 11

results of experiments to determine the deflection of a timber beam under any load. In model beam deflected .03 or $\frac{3}{100}$ in. under concentrated load of 1 cwt. in a span of $\frac{1}{4}$ ft., and .02 under a distributed load. Obviously, therefore, to obtain the deflection of any beam we have merely to regard the conditions, i.e., breadth and depth in inches and span in feet of our beam in the experiment and multiply by the relation $\frac{1}{180}$ the deflections of $\frac{1}{100}$ in. per hundredweight

load for beams under concentrated load, and $\frac{1}{180}$ in. for distributed load. If instead of beams we had cantilevers, we can easily use the same experimental results and increase the figure of $\frac{1}{180}$ in. by the relation between the deflections of girders and cantilevers shown in the table. Thus the deflection of a cantilever 1 in. \times 1 in. \times 1 ft. span under a concentrated load of 1 cwt. could be to the deflection $\frac{1}{180}$ in. for a beam of the same section and load in the proportion $\frac{3}{2}$ to $\frac{1}{180}$, or would be $\frac{1}{120}$ in. \times $\frac{3}{2} \div \frac{1}{180}$ or $\frac{1}{80}$ in. say $\frac{1}{80}$ in. It is, however, in practice more convenient to know what deflection is going to take place in a timber beam loaded to the extent of the handy formula for timber beams under distributed load in hundredweights = $\frac{S^2}{30d}$ inches

S in feet
Under these circumstances, assuming the modulus of elasticity for large scantlings to be 9,000 cwt. per square inch and f to be 9 cwt. per square inch, which is the safe f assumed in that formula, then

$$\Delta = \frac{5}{24} \frac{f l^4}{E I} \quad L \text{ in inches} = 512 \text{ in feet.}$$
$$= \frac{5 \times 9 \times 12 S \times 12 S}{24 \times 9,000 \times d} = \frac{S^2}{30d}$$

So that for wood beams loaded with the safe distributed weight allowed by the handy formula (or any other arrangement of weight involving a flange stress of 9 cwt. per square inch) the deflection can be calculated from the very simple formula = $\frac{S^2}{30d}$. If

modulus of 10,800 be assumed, the formula becomes $\frac{S^2}{40d}$

Limiting Ratio of Depth to Span for Given Ratios of Deflection to Span.

It is often convenient in practical design to determine the limiting proportion of depth to span which will keep deflection within defined limits. For fir timber beams and joists under distributed loads the limit of deflection usually fixed is $\frac{1}{180}$ in. per foot of span of $\frac{1}{180}$ in. and the material is almost invariably calculated for an f of 9 cwt. per square inch. Assuming a modulus of 9,000 cwt. the deflection in such beams,

$$\Delta = \frac{5}{24} \frac{f l^4}{E I} \quad \text{and when this is } \frac{1}{180} \text{ in.}$$
$$\text{then } \frac{1}{180} = \frac{5 \times 24 \times 9}{24 \times 10,800} \times \frac{l^4}{d^3}$$
$$\text{or } \frac{1}{d} = \frac{10,800 \times 24}{480 \times 5 \times 9} = 12$$

depth in inches = span in feet. Which is obviously much more than experience has found necessary.

In this connexion it should be recollected that ceilings are cracked not by the deflection due to the total load, but by that portion which it is represented by the superload. The deflection due to structural load is constant and permanent from the time the structure is completed. When the superload is about half the total load—the old rule for floor joists—depth in inches = half span in feet + 1 would be correct.

For rolled joists or steel girders as beams under distributed load with uniform flanges working to a stress (f) of $7\frac{1}{2}$ tons per square inch and using steel possessing a modulus of 10,000 tons,

$$\Delta = \frac{5}{24} \times \frac{f l^4}{E I} \quad \text{and when this is } \frac{1}{180}$$
$$\text{then } \frac{1}{180} = \frac{5 \times 7.5}{24 \times 10,000} \times \frac{l^4}{d^3}$$
$$\frac{l}{d} = \frac{24 \times 13,000}{480 \times 5 \times 7.5} = 17.5$$

The limiting deflection of rolled joists is more frequently taken at about $\frac{1}{360}$ under which conditions the ratio $\frac{l}{d}$ would be about

24 or depth in inches = half span in feet.
Before leaving the subject of deflection it is necessary to note one practical point with regard to cantilevers. It will be found that these often show a deflection greater than is expected. This is because the formula assumes that one end of the cantilever is fixed; but absolutely fixed ends are in ordinary building work almost impossible, and a very slight yielding of the material anchoring the short arm may mean a considerable drooping of the end of the long arm. Take the case of a cantilever 12 ft. long built into a wall with plates top and bottom, and so arranged that the effective centre of the top plate carrying the counterweighting masonry is 18 in. from the front edge of the bottom plate upon which the long arm would tend to rotate. If the top plate moved upwards under the action of the load and compressed the counterweight of masonry to the extent of $\frac{1}{16}$ in., the long arm would drop eight times as much, or $\frac{1}{2}$ in. in addition to the elastic deflection. In the case of a cantilever which is a prolongation of a

Fig. 12.

girder over one of the bearings, the fixing of the cantilever is obviously flexible. In the case of a cantilever loaded with a distributed weight and counterweighted by means of such a girder similarly loaded and of the same span, as in Fig. 12, the deflection is just double the normal, the difference being due to the flexibility of the counterweighting arm.
Cases necessitating the exact calculation of the deflection of balanced cantilevers do not often arise in architectural practice, cantilever arms being usually kept short; but, if necessary, simple methods of calculation there will be found in Professor T. Claxton Fidler's well-known book on "Bridge Construction."

THE TOWER OF PISA.

In consequence of representations made relative to the stability of the Tower of Pisa the Italian Government last year appointed a Commission to inquire into the actual condition of the structure and to compare the results ascertained with those obtained in 1817 by Cresy and Taylor and in 1859 by Rohault de Fleury.
Measurements taken by the Commission show that the projection of the seventh cornice beyond the first cornice is 2.868 metres, the inclination of the axis being 5.248 metres for the total height of the tower.
According to the measurements made in 1817 by Cresy and Taylor, the inclination of the axis was 3.053 metres. Therefore, if both sets of measurements are accurate, the summit of the tower has moved through the space of 195 millimetres, or nearly 8 in., during the past ninety-three years.
Again, the observations by Rohault de

The Leaning Tower of Pisa.
(From Genie Civil.)

Fleury in 1859 showed the inclination to be 3.180 metres, representing an increase of 127 millimetres since the investigation forty-two years earlier, and giving 68 millimetres as the movement during the succeeding period of fifty-one years.
Thus we get the mean annual increases of inclination of 3 millimetres for the period 1817-59, 1.3 millimetres for the period 1859-1911, and 2.1 millimetres for the period 1817-1911.
Of course, it would not be safe to draw any inferences from the figures quoted unless first satisfied that all of them were absolutely reliable, a matter concerning which there is reason for doubt. The original report and drawings by Cresy and Taylor are not to be found to-day, and the only drawing at the disposition of the Commission was the copy of a section of the tower made in 1831 by Raniere-Grassat from the original of Cresy and Taylor. From this section it appears to be clear that the measurements taken by the two architects mentioned were taken in a direction not exactly agreeing with the maximum inclination, but at a vertical section making an angle of 5° 31' with the section of maximum inclination.
Consequently, comparison of the latest records with those of previous dates is of no practical utility, and we have no means of judging whether the inclination of the tower has changed or remained constant during the past century.
It is generally admitted to-day that the tower was originally intended to be vertical, but that after its commencement in 1174 subsidence took place, giving rise to the inclination which has made the tower not only a curiosity, but also an instructive object-lesson in building construction. Various discoveries by Rohault de Fleury show the accuracy of this view, one being the presence of a gargoyle at first-floor level, the channel of which is at an angle opposed to that of the outward flow of water, and another the evidence of attempts made to correct the inclination of the tower by increasing the height of six successive stories at the gradually-sinking side. According to De Fleury, the differences of height for the stories in question are 3, 4, 7, 14, 8, and 9 centimetres respectively, and it is interesting to recall the fact that the same kind of artifice has been adopted at

FIG. 1—SIDE ELEVATION AND CROSS SECTION OF 80-FT. GIRDER AT THE HOOD RUBBER COMPANY

(From Cement Age.)

other places in Italy with the object of correcting the inclination of towers which, like that of Pisa, were built during successive epochs.

Borings made under the direction of the present Commission have proved that, contrary to hitherto prevailing views, the tower was not founded upon a solid cylindrical masonry base but upon a masonry ring 3 metres thick beneath the circular wall of the tower, and now having the same inclination as the first floor of the structure.

The most satisfactory conclusion drawn by the Commission is that, as no sign of recent movement exists, the stability of the tower is not endangered. However, a series of bench-marks has been established by means of which it will be easy to follow any deviations of the axis which may occur in future years.

REINFORCED CONCRETE GIRDER OF 80-FT. SPAN.

In a new factory at Watertown, U.S.A., the flat roof of the main building is carried by reinforced concrete girders, 80 ft. long by 9 ft. 6 in. deep, spaced at intervals of 20 ft. apart. The object of employing members of this exceptional span was to obviate the use of interior columns, which would have interfered with the operation of a travelling crane extending across the building.

FIG. 2—DETAIL SHOWING SPACER TO HOLD STEEL BARS IN POSITION IN THE 80-FT. GIRDER.

(From Cement Age.)

Fig. 1 is a side elevation and cross-section of a typical girder, the weight of which was kept down by the hexagonal openings shown, which in the girder at one end of the building are utilised for the insertion of windows. Fig. 2 shows the arrangement of the bars in

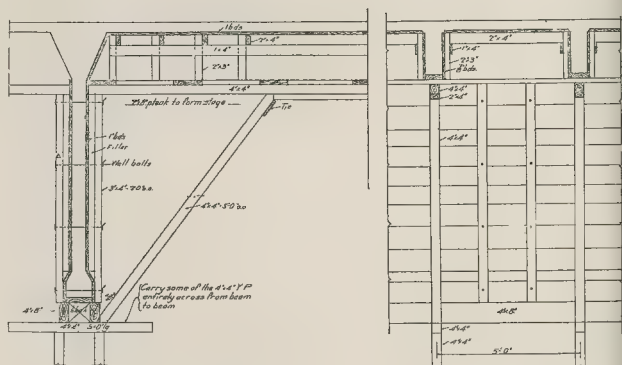

FIG. 3—SECTION AND ELEVATION OF CENTERING USED ON AN 80-FT. GIRDER.

the tension boom, and the spacing clips employed to hold the bars in the predetermined positions.

Owing to the unusual length of the girders the reinforcing bars were specially rolled in 100-ft. lengths, so as to avoid joints in the metal. The main tension reinforcement consists of ten 1½-in. square bars, and diagonal reinforcement is provided by ½-in. square corrugated bars arranged in pairs on each side of the centre line. To provide resistance to shear at the ends of the girder, three ½-in. square corrugated bars are carved down diagonally as represented in Fig. 1.

The whole of the reinforcement is of high carbon steel, the working stress having been taken at 20,000 lb. per square inch. Details are given in Fig. 3 of the moulds used in forming the girders, which, together with the building itself, were constructed by the Abertaw Construction Company, of Boston.

CONSTRUCTION NOTE.

The subjoined notes are taken from specification clauses prepared by Mr. H. H. Quimby and adopted by the National Association of Cement Users (U.S.A.):—

Moulds.—For all surfaces of concrete intended to be exposed the face of the moulds shall be straight, smooth, evenly matched, and watertight, and made so as to be removable

without injury to the concrete. Any offsets at joints shall be dressed off flush, and any openings or knotholes shall be caulked with some stiff, plastic material, such as clay mixed with plaster of Paris or sand. The interior of the moulds shall be treated with petroleum or other water repellent to obviate adhesion between the concrete and the wood.

Depositing Concrete.—The concrete should be wet enough to flush, and be spaded against the face of the mould. The spade is then to be used to push the aggregate forward, care being taken to obtain uniformity of mixture and texture at the face. Concreting shall be continuous throughout definite stages of the work, so that joints shall be at the time of some structural feature, or be made truly straight and level.

Scrubbing Surface.—While the concrete is friable or pulverable, the face boards shall be carefully removed and the concrete surface scrubbed with ordinary fibre brushes with a light stream of water from a hose, until the aggregate is exposed to uniform degree and then rinsed off with water and kept moist for several days. If the concrete has set too hard, wire brushes, followed by fibre brushes and rinsing, may be used. Any voids and similar defects shall be patched with concrete of the same mixture immediately after scrubbing, using the hand or a wooden float—not a steel trowel—for applying and smoothing the patches. After they are sufficiently set—say within from five to twenty-four hours—patches shall be scrubbed to the same texture as the general surface, and be rinsed clean and kept moist for several days.

THE BUILDING TRADE.

AUSTRALIAN BUILDING AND LABOUR NOTES.

THE New South Wales Government has embarked upon a scheme for the manufacture of bricks. An area of twenty-two acres has been secured in a suburb of Sydney, which, it is presumed, will produce fifty millions of bricks per acre. The construction of the kilns is under way, and forty-five workmen employed. Several improved square-end Hoffman kilns are being installed, and seven brick-making machines are being put in, and an output of 300,000 bricks per week is promised in the immediate future.

One of the reasons why the New South Wales Government is undertaking the manufacture of bricks upon a large scale is in order to combat a brick combine which, it is alleged, exists in Sydney, for the purpose of keeping up prices and pressing out smaller competitors. The present prices of bricks in Sydney is about 40s. per 1,000 at the kiln. The Manager of the Government Brick Works says he considers 19s. or 17s. 6d. per 1,000 a fair price, and then he will be able to supply bricks at these figures.

The State Government is not going to limit its enterprise to brick-making only. The Minister for Works says that it is his intention to undertake building, and establish a thoroughly-equipped building yard. He will then be able to compete with any builder in Sydney. He says that the present difficulty he experiences is to get a suitable man to take control of the work. The salary (£1,000 a year) is not sufficient to induce any one of the leading Australian builders to take the position. Several have been sounded. Their replies have been to the effect that they are now making 3,000s. or 4,000s. a year. Under the circumstances, the Minister says if a suitable man cannot be obtained in Australia at £1,000, or even £1,500, he will be compelled to go to England or America for a man.

There is no question that the labour legislation in Australia has in view making the country a close preserve for workmen already there. Not only is every obstacle put in the way of the workmen abroad becoming familiar with the high wages and comparatively easy conditions ruling there, but efforts are made to prevent boys becoming tradesmen. Journeyman painters, for instance, in a claim now being considered before the Painters' Wages Board, at Sydney, asked that only one apprentice be allowed to every six journeymen painters employed by any one employer.

How the union came to base this demand for this limitation was shown in argument at the first sitting of the Wages Board, which took place last month. The Secretary of the union said that the basis was on the assumption that the average painter now at the trade would live thirty years. One boy turned out every five years in a shop employing six journeymen would mean that there would be six apprentices at the end of thirty years to replace the six workmen. It was pointed out by the Chairman that this proportion would be quite insufficient. In the first place, the average life of painters at various ages at any one time would be considerably under thirty years, and nearer fifteen years. The union also assumed that every man entitled to apprenticeship would take the proportionate number allowed, that every apprentice would remain at the trade, that no apprentice would die, and that there would be no increase in population in Sydney. As these assumptions are erroneous, it can easily be seen that the limitation of one in six would mean that in thirty years there would be only half the present number of journeymen.

All unions, however, do not take such narrow views in regard to the matter of competition. The Secretary of the Journeymen Plasterers' Union recently announced in the daily papers that his union did not discourage journeymen plasterers coming to Australia. He said there was more work than the existing number of tradesmen could cope

with. This union welcomed English plasterers so long as they were good tradesmen. The Bricklayers' Union also said through its Secretary there was plenty of work at Sydney for bricklayers for many years to come. The difficulty experienced was to obtain supplies of bricks, notwithstanding the fact that brick kilns were working high pressure and several new kilns had recently been put into operation.

The building of a church measuring 65 ft. by 52 ft. and 35 ft. high was started and completed in one day at Preston Victoria, on March 27 last. The structure had weatherboard walls and galvanised-iron roof. The whole of the work was carried out by a large staff of carpenters, plumbers, and painters, all of whom gave their services gratis. The suggestion of completing the church in one day was made by a clergyman connected with the Associated Churches of Christ, who before he became a clergyman had been a carpenter. The carpenters got a start early, and the plumbers followed them and commenced operations by 2.30 p.m. Between that hour and the evening of the same day the spouting, down pipes, galvanised-iron roof, and gas fittings were in position, and the painters also carried out their part of the work. The church was ready for divine worship on the following day.

There is great divergence in materials used for building in various parts of Australia. It is not always easy to account for the differences apparent, except that the fact that people get accustomed to particular styles of materials and are disinclined to change. The availability of materials is also in consideration. Before the heavy duties placed on timbers the wood house had a distinct advantage over the brick house in Australia. Now, owing to the Customs duties imposed on imported timbers, the cost of wood houses has increased considerably, and in the case of a five-roomed house there is generally not more than 60s. difference in favour of the wood house.

Except for the risk of fire, the extra cost for insurance, and the extra cost of painting and keeping in repair, the wood house, as far as Australia is concerned, makes a satisfactory dwelling. It is cool and attractive, and the cost of material and labour entailed in its construction being less, there is less temptation to skimp the size of rooms.

Roughly, there are two classes of wood houses generally built in Australia. One is the weatherboard house, with the galvanised-iron roof. All outside, excepting the roof, is usually painted. The other style is a variation of the half-timbered Elizabethan house. It has hardwood framing, and tongue and groove timber weatherboard or rough-cast walls, with slate, tile, or shingle roof.

The use of shingles in Australia for roof or walling is not uncommon. The class of shingles used are usually either oak or American redwood. Oak shingles are left unfinished. They weather to a pleasing grey tone. The redwood is usually stained green or brown. For purposes of roofs, shingles are more costly than either slate or tiles, and are only used to give a homely or distinctive look to private houses.

IS EXTERNAL POINTING IN BRICKWORK DOOMED?

In all the treatises on building construction very lengthy descriptions are given of the various kinds of pointed joints in brickwork, and the advantages and disadvantages of each, but there is always a warning against building brickwork or pointing in frosty weather. The use of mortar in frosty weather has in some cases been continued by mixing sugar with it, and satisfactory results are said to have resulted.

The warning against frost, however, would have struck Gilbert as a useful idea if he could ever have been able to employ it literally, for why caution the builder against something he cannot prevent. His work, sooner or later, will have to stand the test

of frost as well as time. If the mortar will not stand frost, whilst it is wet, then, although it dries and hardens, water can still enter through the absorbent bricks.

Bricks, unless they be of the pressed, hard-burnt vitrified type, such as Staffordshires, will absorb moisture, rain will soak well into porous sand-faced bricks, and then the mortar is attacked internally as well as externally. The so-called weather-struck joint, with its nice slope, retains more water than a plain flush vertical joint; besides, wherever there is a crevice water will accumulate. Instead of the water running or trickling down the surface of the joint, some of it creeps upward, and the other only soaks into the brickwork underneath the joint.

Unless, therefore, both the mortar and bricks be hard the water will enter, and it is only a matter of time and disintegration must take place. This is very apparent to everyone, for it is necessary to repoint brickwork every few years to keep it smart in appearance.

Mechanical brickwork, like mechanical lettering, has no beauty, except, perhaps, a statistician to be the judge, for although a straight line—or a few straight lines judiciously congregated as in a cornice—be a thing of beauty, innumerable straight lines mathematically arranged with others at right angles tire the eyes, lacking sympathy.

Many of our large industrial towns owe their lack of beauty to this very fact, and the sausage-machine-like turn-out of the endless rows of houses. The sharp, clear-cut edges of the Victorian type of machine-made red bricks added to this unpicturesqueness, and even where that was lacking the various forms of false jointing of the patch-as-patch-can type brought about the same results.

The sole aim and object of the brick manufacturer seemed to be to get the maximum size of brick allowable within the statute limit for taxation, which, combined with the proportions of breadth and thickness for proper bonding, gave the universal size of the bricks employed.

The use of hard bricks, although commendable from the point of weatherproofness, has been found to be conducive to dampness internally. With a soft brick a certain amount of "breathing" takes place, and is probably one great reason why houses built with them have not been universally damp.

When the mortar was set back in the joints of the Church Hall at Westminster the fact was freely commented upon and questioned as to its advantages, but the idea has taken root and been greatly employed elsewhere. Flush joints have also been greatly employed, the mortar simply being finished off with the trowel as the work proceeds.

Thin bricks after the Roman type have also come into vogue, and their judicious employment in arches, strings, and to jambs of doors and windows introduces an artistic element entirely lacking in mechanically-jointed brickwork.

SOME LEGAL QUESTIONS ABOUT EXTRAS.

WE have received the following communication from Mr. J. E. Yerbury, F.S.S.:—
"The article in your issue for August 4 last raises a point which has struck me very forcibly on many occasions when engaged in arbitration and High Court cases, viz.—Is it not time to call a conference of representative architects and builders to revise the present R.I.B.A. form of contract?"

I have had a good deal of experience in arbitrations and in cases before official referees, and am quite convinced that the majority of those cases might have been saved by the use of a more simple form of contract.

I cannot at the moment enter into a detailed criticism of the R.I.B.A. contract, but I should like to refer to one or two of the points raised in your article.

1. Who is liable to pay for extras?

It is obvious that if the building owner requires extra works, and orders them, or

allows the architect, his agent, to do so on his behalf, he (the building owner) is liable. And I think, if having knowledge that work is being done which he has been informed would be an extra, he would make himself liable if he did not repudiate as soon as it became within his knowledge that the work was being done.

But in the rare cases, I think, when the contract limits the agency of the architect, by the insertion of a clause, or an addition to one of the clauses of the R.I.B.A. contract, setting out that the architect shall not have power to order extra works, or limiting the amount he is authorised to spend upon extras, it is obvious, to my mind, that the architect is liable for all extras ordered by him, not covered by the contract.

It would follow from this that the builder must obtain an order for all works he wishes to charge for as extras, and it will depend upon the form of contract to whom he is to look for the order.

- (a) Entirely to the architect where no restriction is put upon his authority under the contract.
- (b) To the architect where his agency is limited in amount, first up to the limit of his authority, and then to the employer.
- (c) Entirely to the employer where all authority is taken from the architect by the contract.

Under the R.I.B.A. contract the builder must obtain the order for extras in writing, and the failure of unbusiness-like architects to comply with this condition has cost builders thousands of pounds. It is the duty of a builder's foreman to look after his employer's interests, and he is naturally on the look-out for extras. It is the architect's desire to make his work as perfect as possible, and improvements which suggest themselves as the work proceeds are ordered and carried out, and it is only when the builder's account is rendered at the end of the job that the architect is aware that he has been reckless.

The builder naturally charges as much as he can, generally from 25 per cent. to 250 per cent. more than the architect expects. The architect cannot deny the order for work, and would pay what he thinks a reasonable amount—the employer perhaps is willing to pay what the architect certifies, but the builder's idea of a reasonable amount is not the architect's. They soon get into a fight, and then the clause that all extras shall be ordered in writing is pointed out, and the builder has to take what he can get.

But is it quite fair that this clause should work so hardly against the builder?

If an architect of repute gives an order on the job, the builder goes on with the work trusting the architect to send the order, and if he fails to do so it is hard that the builder should suffer the loss of the cost of that work.

In other cases the builder does not know of an extra until the work is completed; the foreman takes the order and carries out the work; he cannot say to the architect, without a certain reflection upon the architect's good faith, "Very well, sir, I will stop the work until you send your order in writing," or "I will not go on with this, as it will be an extra, unless you put your order in writing at once."

The method I have adopted in my own practice is a simple one. I have special books printed for omissions and additions, and for extras. On these order-books I have printed at the bottom a notice in black type that no order will be recognised as an extra unless given on one of these special forms, or by letter signed by myself. On my certificates I also state that the certificate is paid on the understanding that no extras will be charged except those authorised by these orders, the total amount of which are shown on the certificate.

And I make this easy by obtaining an estimate before I give an order for extras if it is possible, and where impossible I state the number of the exceptions.

In this way I know exactly where I am, and the builder is in the same position. The building owner, when he receives my certificate, knows that there are extras, and generally the amount—where exceptions are comparatively numerous, he has his attention called to the fact as the work proceeds.

Builders who have worked under me for the

first time have complained that my methods were irksome, but before the end of the job they have usually informed me that they wish every architect would adopt my plan; and I have never had to fight a builder or found a client dissatisfied at the end of a job.

2. The next point I wish to refer to is that under the R.I.B.A. contract the only safeguard to the builder is the arbitration clause, for, as you say in your article, "the builder submits himself entirely to the judgment of the architect" subject to arbitration.

With a strong and just architect this works well enough, but with a weak or unjust one, or one under the thumb of an employer, very badly indeed. It is true the builder, if he can afford it, may take advantage of the arbitration clause, but this means time and money, and at present the arbitrator is nearly always an architect, and my experience is that the architect who is a good arbitrator on a building contract is very difficult to find. The arbitrator should always be a lawyer, or, if an architect, one specially qualified by experience and training to deal with matters in a judicial manner, and they are rare. I remember one case where a distinguished arbitrator, who was an architect, gave very heavy penalties against a builder upon facts which only an architect who had been in similar difficulties himself could possibly have given such an award. He was honest, but he treated his brother architect as he would wish himself to be treated, and could not appreciate the position which really existed.

Had an appeal been possible, I am quite certain his award would have been laughed at by lawyers.

I do not agree that "it is a nice question how far the architect has authority to bind the building owner in making alterations"; it appears to me to be perfectly clear that the architect is the agent of the building owner and has authority to do all an agent may do, unless such authority is clearly and definitely restricted by the contract; and the owner is bound to pay upon presentation of architect's certificate. I believe there is no safer bond to sue upon than an architect's certificate properly given under the R.I.B.A. contract.

I fear your space will not allow me to deal with other points in your article, but I trust you will allow me the opportunity of raising these questions in your columns, viz.—1. Is it not time the R.I.B.A. contract was revised and very greatly simplified? 2. If this is done, would it not be more satisfactory that the arbitrator should be a lawyer rather than an architect? It may be said that this would take remunerative work from one profession and transfer it to another, but I don't think this would be the case. The arbitrator being a lawyer, architects would be employed to state the case rather than counsel.

BUILDING AND LABOUR IN MELBOURNE.

We learn from the Melbourne *Argus* that great difficulty is being found by architects and others who have building contracts to let to find builders who are willing to undertake them. Even for large city jobs, where there is abundant room for high profit, very few tenders are received, while tenders have to be called again and again for important country jobs before anybody can be found willing to execute them. The reason is not that builders are less enterprising or that they are at all unwilling to undertake the work. They are not able to do it, because they cannot obtain tradesmen to man the jobs. The difficulty has reached an acute stage. The Master Builders' Association has 110 members. Details of the number of men urgently needed by all of them showed that the trade was undermanned to the enormous extent of 50 per cent. The number of bricklayers, plasterers, painters, plumbers, and so forth requires to be doubled before it will be possible for the builders to cope with all the work which requires to be done. It is not that there has been any extraordinary boom in the building trade. For years past there has been a steadily increasing activity in the trade. The population of Melbourne and of Victoria has been growing, and people must be housed. Businesses of all sorts have been increasing, and larger buildings will be needed. At all holiday seasons the existing accommodation is unable to meet requirements. There has been extension in this direction. Hundreds of thousands of pounds are being spent every year in that branch of business alone. Warehouses, factories, shops are

being rebuilt and enlarged in all parts of the city. Public buildings are being erected to meet the increased requirements of Government institutions. Hospitals and charitable institutions of all kinds require more building accommodation. The growth of population and the increased prosperity of the country are jointly responsible for this, for it is the same all over Australia. In Sydney a great number of very large building operations have been postponed until the builders are able to deal with them. The tradesmen to do the work are not to be found in Australia, and those who want the buildings just have to wait. At least 500 bricklayers are urgently needed in Melbourne. By "bricklayer" is meant a skilled tradesman. Every man who calls himself a bricklayer does not comply with that description. It is estimated that if 500 bricklayers could be obtained there would be room also for at least 150 additional bricklayers' labourers, 150 plasterers, and 200 painters, carpenters, carpenters' labourers, and plumbers. In these estimates no account has been taken of the needs of the country districts, though the scarcity of labour there is greater than in the city, for tradesmen have gradually deserted the country to take up the more congenial work in Melbourne. Wages in the trade are high, while the hours are limited to forty-four per week. Bricklayers receive a minimum of 1s. 6d. per hour—6s. per week. Plasterers are paid 11s. 8d. per day. Painters receive 1s. 3d. per hour. Plumbers' wages are 1s. 7d. per hour, and tuck-pointers are paid 11s. to 12s. per day. Carpenters receive from 6s. 8d. a week for foremen who exercise control over the work of three men or more to 5s. 3d. a week for ordinary carpenters' labourers. The working carpenter receives 6s. 2d. per week. Their hours are forty-four a week. They do not commence work until a quarter to eight o'clock in the morning (double rates are paid for time worked before that hour), and do not work after a quarter-past five o'clock on week days and a quarter past twelve o'clock on Saturdays. All holiday work is paid for at overtime rates. Wages boards control the wages and hours of all the workmen in the building trade, and some of these boards are even now considering determinations which will increase the rates. Although these rates are fixed by wages boards, they are only the minimum. Builders pay good tradesmen considerably higher rates. An increase of 1s. a day is gladly given to retain the services of good tradesmen.

GENERAL BUILDING NEWS.

NEW SCHOOL, CRAIGTON.

This school has been erected to provide accommodation for 1,020 pupils, and has been designed by Messrs. Watson & Salmond, architects, of Glasgow.

NEW SCHOOL, WEMYSS.

Mr. G. Charles Campbell, of Methil, is the architect for the new school, which is proposed by the Methil Trust. The estimated cost of the work is 10,000l., and the accommodation is for 1,000.

NEW SCHOOL, BITTON VALENC.

These buildings have been erected by Messrs. Wallis & Sons, Ltd., builders, of Maidstone, at a cost of about 30,000l. The architect for the work was Mr. H. Percy Adams.

NEW SCHOOL, MONKTON.

A new school is to be erected, providing accommodation for 160 pupils, at an estimated cost of about 975l. The architect is Mr. W. W. Reid.

PUBLIC SCHOOL, MUTHILL.

Additions are to be made to this school, including rooms for cookery, laundry, and woodwork, etc. The following are contractors for the work: Mason, Mr. J. T. McRobbie, Muthill; joiners, Messrs. Taylor & Scobie, Blackford; glazier, Mr. R. Williams, Muthill; plasterer, Mr. Jas. Gortie, Crieff; plumbers, Messrs. Bennett & Ferguson, Crieff.

PUBLIC LIBRARY, NEW CROSS.

Messrs. Castle & Warren, architects, of Norfolk-street, Strand, W.C., prepared the designs for this new library, which has been erected at a cost of about 12,000l. The building was Mr. F. J. Gorham, and the heating arrangements were carried out by Messrs. Buckley & Co.

PAVILION AND WINTER GARDENS, MARGATE.

These improvements at Margate include the erection of a pavilion, with seating accommodation for 2,500, an open arena with accommodation for 1,200, and balconies overlooking the sea with a provision for 500. The whole scheme has been designed by Mr. Borg, the Borough Engineer, and the estimated cost is about 23,000l. The contractor for the work was Mr. Deane.

TRADE NEWS.

A new clock has been ordered for the Parish Church, Widdow Church, near Ware, Herts, which will strike the hours and show time on a large dial. It is to be fitted with all the latest improvements, and generally to the designs of the late Lord Grimthorpe. The makers are Messrs. John Smith & Sons, Midland Clock Works, Derby. The same firm have also recently made clocks at Saxthorpe Church, Norfolk, and Barton Mills Church, Suffolk.

Boyle's latest patent "air-pump" ventilators have been applied to Burton-on-Trent Grammar School.

The John Coupland Hospital, Gainsborough, being supplied with Shorland's double-ported patent Manchester stoves with descending smoke flues, patent Manchester grates, exhaust roof ventilators, and inlet ventilators, by Messrs. E. H. Shorland & Brother, Ltd., of Failsforth, Manchester.

APPLICATIONS UNDER LONDON BUILDING ACTS, 1894 to 1909.

Width of Way.

Holborn.—Erection of a building upon the site of Nos. 9, 10, and 11, Eagle-street, Holborn (Mr. W. C. Waymouth).—Consent.

Width of Way and Line of Frontage.

Fulham.—Erection of buildings on the south-western side of Burlington-road, Fulham (Mr. Kesteven for Mr. F. H. Shepherd).—Consent.

Line of Frontage and Construction.

Hammersmith.—Showcase in front of No. 40, King-street, Hammersmith (Mrs. L. Raleigh).—Consent.

Kensington, South.—Showcase at No. 114, Church-street, Kensington (Mrs. L. D. Candler).—Consent.

Width of Way, Projection, and Construction.
City of London.—Brick, steel, and concrete gangway over the public way of Catherine Wheel alley, Bishopsgate (Mr. H. E. Hoven).—Consent.

Width of Way, Deviation from Certified Plan, Projections, and Construction.

Kensington, South.—Addition over the motor garage at Nos. 39 and 41, Queen's-gate-place, Kensington, the erection of an external iron staircase and balconies, and the erection of a boundary fence (Messrs. W. D. Hodges & Co., Ltd.).—Consent.

Space at Rear.

Kensington, South.—Addition at the rear of No. 44, Duke's-lane, Kensington (Messrs. Moore & Hunter for Mrs. E. E. Annett).—Consent.

Strand.—Hotel building upon a site abutting upon Glasshouse-street, Air street, Brewer-street, and Sherwood-street, Westminster (Messrs. W. J. Ansell and H. Tanner, jun.).—Consent.

Westminster.—House to abut upon the western side of Smith-square (Mr. E. L. Lutons for the Right Hon. R. McKenna, M.P.).—Consent.

Space at Rear and Alteration of Buildings.

Clapham.—Alterations at Nos. 310, 312, and 314, Clapham road, Clapham (Mr. J. J. Freeland for Mr. F. G. McKim).—Consent.

Southwark, West.—Alterations at Nos. 145, 147, and 149, Borough High-street (Messrs. S. Haskins & Brothers). Refused.

Building for the Supply of Electricity.

Hamstead.—Two wooden cooling towers with steel substructures at the Hamstead Metropolitan Borough Council electricity generating-station, Lithos-road, Hamstead (Klein Engineering Company (1908), Ltd., for Hamstead Metropolitan Borough Council).—Consent.

Holborn.—Steel and concrete chimney-shaft at the electricity generating-station, Short's-gate, Holborn (Charing-cross, West-end, and City Electricity Supply Company, Ltd.).—Consent.

Limehouse.—Iron building beneath the coal weighing hopper at the southern end of the telegraph track at the electricity generating-station of the Stepney Metropolitan Borough Council, Narrow-street, Limehouse (Mr. W. C. P. Tapper for Stepney Metropolitan Borough Council).—Consent.

Limehouse.—Coal hopper and an ash hopper at the electricity generating station, Narrows-street, Limehouse (Messrs. Strachan & Henderson, Ltd., for the Stepney Metropolitan Borough Council).—Consent.

Uniting of Buildings.

City of London.—Uniting of a new building in Poppin's-court, Fleet street, with Nos. 107 and 111, Fleet-street (Messrs. Smees & Housh for Messrs. Thomas Cook & Son).—Consent.

Peckham.—Formation of an opening in the party wall between Nos. 24 and 26, Atwell-road, Peckham (Mr. A. Harris for Mr. J. Lennard).—Consent.

Strand.—Additional openings in the party wall between Nos. 3, Clifford-street, and No. 14, Old Burlington street, W. (Mr. C. H. Townsend for Messrs. Owen Grant, Ltd.).—Consent.

Uniting of Buildings and Cubical Extent.

Bermondsey.—Steel, iron, and glass van shelter over a yard at the premises of the Salvation Army on the southern side of Spa-road, Bermondsey (Mr. A. Gordon).—Consent.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ALTRINCHAM.—Institute and alterations to Sunday school (1,600l.); Trustees, Bowdon Downs Congregational Church.

Arnold.—School (4,550l.); Mr. C. J. Bristowe, Secretary, Education Committee, Notts County Council, Nottingham.

Blackhall Mill.—School; Mr. Wood, architect, Burnopfield.

Bymhill.—Enlargement and improvement of schools; Architect, care of The Managers of the parochial schools.

Bolton.—Central offices, Bridgman place (5,000l.); for the Lancashire and Cheshire Miners' Federation.

Branksome Heath.—Enlargement of girls' school; Mr. C. Lisby, Secretary, Education Committee, Poole Town Council.

Brighouse.—St. Chad's Church (12,000l.); Mr. W. H. Wood, architect, The College, Durham, Messrs. W. J. Briggs & Sons, builders, Brighouse. Extensions to premises, Valley Dyeworks, for the Bradford Dyers' Association, Ltd.

Broadstairs.—Showrooms and offices for the Broadstairs Gas Company.

Chelmsford.—Extensions to library (800l.); Mr. C. Brown, surveyor, Chelmsford Town Council.

Chester.—Laundry centre (740l.); Mr. T. G. Huxley, builder, Malpas.

Courthill.—School (250 places); Mr. S. J. Newman, Surveyor, Poole Town Council.

Coventry.—Conversion of Primrose-hill House into slipper baths (2,000l.); Mr. J. E. Swindhurst, Surveyor, Coventry Town Council.

Crowborough.—Enlargement of St. John's School; the Managers.

Darwen.—Cottage home; Architect, care of Clerk to the Guardians.

Dumbarton.—Hall (1,500l.); Mr. W. Reid, Church Street, Dumbarton.

Dunvant.—Extension to Three Crosses in independent Chapel; Mr. W. David, architect, Swansea.

Elgin.—Slipper baths (3,000l.); Mr. A. A. Turfitt, Burgh Hall, Elgin.

Ellesmere Port.—Alterations to Station Hotel (2,000l.), for the Birkenhead Brewery Company.

Folkestone.—The following plans have been passed:—Motor garage, Beacholme, Lower Sandgate road, for Mr. H. R. Kirk; Mr. A. R. Bowles, architect. Additions to garage rear of Nos. 48-50, Rendezvous-street, for Messrs. Gamble & Co.; Mr. O. Marx, architect and builder. Rebuilding additions to No. 23, Ford road, for Mr. H. W. Rye; Mr. H. Vidian, architect.

Glasgow.—Public library, Clydebank (10,000l.); Messrs. Gardner, Millar, & White, architects, 144, St. Vincent street, Glasgow.

Halifax.—Six tramway shelters; Mr. W. M. Rogerson, Tramway Engineer, Halifax Town Council.

Hebden Bridge.—Alterations to Bankfoot Mill for Messrs. Crabtree Brothers.

Herne Bay.—Extensions to East Cliff Pavilion (5,355l.); Messrs. W. Pattinson & Sons, builders, 50, Parliament-street, S.W.

Hornchurch.—Enlargement of the South Hornchurch school (1,450l.); Mr. G. Brown, builder, Maidstone-road, Grays, Essex.

Horton Kirby (Kent).—School, Birchwood corner (2,500l.); Messrs. Hodder & Son, builders, Bromley.

Houston (Renfrewshire).—Extensions to school (2,000l.); Mr. W. Kerr, builder, Houston.

Hull.—Training college (40,290l.); Messrs. G. H. Panten & Sons, builders, 206, Anlaby-road, Hull.

Huntingdon.—Enlargement of school (1,185l.); Mr. J. C. Wrixley, Secretary, Education Committee, North Riding of Yorks County Council, Northallerton.

Hvda (Cheshire).—Swimming baths (3,000l.); Mr. Joseph Mitchell, Council Offices, Hvda.

Keighley.—School (4,700l.); Mr. A. P. Harrison, architect, Highfield lane, Keighley; Messrs. H. V. Robinson, Ltd., builders, Lawk-holme-lane, Keighley. School (2,000l.); Mr.

Leeds.—School (2,000l.); Mr. A. P. Harrison, architect, Highfield lane, Keighley; Messrs. H. V. Robinson, Ltd., builders, Lawk-holme-lane, Keighley. School (2,000l.); Mr.

Leeds.—School (2,000l.); Mr. A. P. Harrison, architect, Highfield lane, Keighley; Messrs. H. V. Robinson, Ltd., builders, Lawk-holme-lane, Keighley. School (2,000l.); Mr.

Leeds.—School (2,000l.); Mr. A. P. Harrison, architect, Highfield lane, Keighley; Messrs. H. V. Robinson, Ltd., builders, Lawk-holme-lane, Keighley. School (2,000l.); Mr.

Leeds.—School (2,000l.); Mr. A. P. Harrison, architect, Highfield lane, Keighley; Messrs. H. V. Robinson, Ltd., builders, Lawk-holme-lane, Keighley. School (2,000l.); Mr.

H. Shackleton, Sefton-road, Morecambe. Lloyds Bank (6,000l.); Mr. S. Kitson, architect, Greek-street Chambers, Leeds; Paul Rhodes, builder, Skinner-lane, Leeds.

Langley Green.—Extensions to premises for Messrs. Ham, Baker, & Co.; Mr. William Jackson, builder, Langley Green.

Lithney.—School (1,700l.); Mr. Sampson Hill, architect, Green-lanes, Redruth.

Littlemill.—Instruction centre for the Croydon School Board.

Lowestoft.—School, Christ Church square; Messrs. B. Oliver and H. J. Chatwood, architects, Sudbury.

Manston.—School; Messrs. Cannon & Chorley, 16, Park square, Leeds.

Matlock.—Post Office (12,000l.); Mr. J. W. Wildgoose, builder, Matlock Bath, Derbyshire.

Middlesbrough.—Extensions to shipping offices, Albert-road, for Messrs. Constantine & Pickering. Clothing factory for Messrs. Stewarts, Ltd.

Newhaven.—School; County Architect, East Sussex County Council, County Hall, Lewes.

New Shildon.—Territorial headquarters; Mr. H. C. Chapman, architect, Grainger-street, Newcastle-on-Tyne; Mr. J. Moore, builder, New Shildon. Hall, etc.; Mr. H. Chapman, architect, Grainger-street, Newcastle.

Newton Abbot.—College (40,000l.); Messrs. Mitchell, Son, and Gutteridge, architects, 9, Portland-street, Southampton.

Newtown.—Shop, Buxton-road, for the New Mills Co-operative Society.

Penmau.—(near Liskeard).—School (2,100l.); Mr. J. C. Andrew, architect, Biddicks-court, St. Austell.

Penzance.—School (4,000l.); Mr. Sampson Hill, architect, Green-lanes, Redruth.

Port Erroll.—Extensions to school (2,155l.); Mr. A. H. L. McKinnon, architect, 245, Union-street, Aberdeen.

Radcliffe.—Extensions to asylum (29,300l.); Mr. E. Purnell Hooley, Surveyor, Notts County Council, Shire Hall, Nottingham.

Ilrarny.—(21,155l.); Messrs. Woodbridge & Simpson, builders, Oxford.

Redruth.—House; Mr. Leonard Winn, architect, Boscover street, Truro.

Rochford (Essex).—Alterations to work-house; Mr. F. Grogson, Clerk, Rochford Board of Guardians, Southend.

Rotherham.—Plans have been passed for Messrs. Armstrong & Wortley for nine houses, St. Stephen's-road; also for Mr. D. Hobkin son, for alterations and additions to Nos. 93, 95, and 97, Frederick-street.

Sheffield.—Proposed enlargement of nurses' home (about 9,000l.) for the Sheffield Royal Hospital Board.

Staverton.—Isolation hospital (7,700l.); architect, care of Mr. J. B. Williams, Surveyor, Daventry Rural District Council.

Stretford.—A plan has been passed for Messrs. John Greenwood & Sons, Ltd., for a bakery in Elevator road.

Sutton-in-Ashfield.—School (4,350l.); Mr. J. Greenwood, builder, Mansfield.

Swansea.—Six mills near present works for the Dyffryn Tintplate Company, Morriston.

Taunton.—Additions to library, Corporation-street (1,430l.); Mr. F. Small, builder, Newcastle.

Torquay.—Two houses near Trenchford Dam; Mr. W. B. Crocker, builder. Three conveniences (700l.); Mr. H. A. Garrett, Engineer, Torquay Town Council. The following plans have been passed:—Additions and alterations to Stoodley Knowle, for Colonel Burn, M.P. Additions to "Highfield," Middle Warberry-road; Mr. C. Hankey, alterations and additions to Conway House; Hon. E. Douglas. Additions to "Rocombe," Higher Warberry road, Mr. R. Skir. Motor garage, "The Nest," Mr. J. M. Fodley. Six houses, Mallock-road; Mr. Johnson.

Wallsend.—School (10,000l.); Messrs. Marshall & Tweedy, architects, Eldon-square, Newcastle.

Warrington.—Extensions to warehouse (1,700l.); Messrs. W. & S. Owen, architects, 4, Cairo-street-chambers, Warrington.

Warwick.—Children's homes (3,000l.); Mr. F. Cundell, architect, 34, The Parade, Leamington, Spa.

West Bridgford (Notts).—School (4,050l.); Messrs. Bosworth & Love, builders, Nottingham.

Wigan.—Proposed abattoir for the Wigan and District Co-operative Society. Plans have been passed as follows:—Extensions to slaughter house, etc., Miry-lane, for Messrs. Gallaher Brothers. Three houses, etc., Bolton and Hen streets; Mr. John Winstanley. Additions to Nos. 199 and 201, Poolstock-lane; Mr. H. Tittensor.

Workson.—Twenty-eight houses, Kilton-road, for the Workson Co-operative Society.

York.—Proposed receiving home, Haxby-road (1,200l.); Mr. G. Sykes, Clerk, Board of Guardians, York. Working-class houses, Almaterrace (1,500l.); Mr. F. W. Spurr, Surveyor, York Town Council.

LAW REPORT.

BEFORE THE OFFICIAL REFEREE
(MR. MUR MACKENZIE).
Contractor's Action against Building Owner.
Minter v. Waldstein.*

THE hearing was resumed last week of this case, it being an action brought by Mr. F. G. Minter, a builder and contractor, living at Wimbledon, to recover 2,750*l.* from the defendant, Mr. Chas. Waldstein, a Professor of Fine Art at the University of Cambridge, which sum the plaintiff alleged to be due to him under a certificate of Mr. William Foster, an architect, in respect of the reconstruction of Newton Hall, near Cambridge, of which the defendant is the owner. Defendant counterclaimed for 10,000*l.* damages, alleging that the plaintiff's work was defective, and that the materials used were not in accordance with the specification.

The facts of the case and the evidence were fully reported in the issues of the *Builder* of July 14, 21, 28, and August 4 last.

On Thursday last week Mr. Jude was cross-examined by Mr. Lewis Thomas.

He said he had been in business at Harston, which was a small village near Cambridge. He had never built such a large house as Newton Hall, and never wanted to. He had written to Mr. Foster, before the tenders went out, that he would be glad to do any work in the reconstruction of Newton Hall if he was given the order. He did not get any offer until after Minter was doing the work.

Did considerable friction arise between you and Mr. Minter when you were doing some supplemental work?—If you refer to the conservatory, I say yes.

Cross-examination continued.

It was occasionally the case in new buildings that work had afterwards to be done in easing doors and adjusting locks. Lyon, the butler, gave him the order to come to Newton Hall and ease the doors.

Do you say that it is a proper thing for one man alone to take down a door for the purpose of easing it?—I do not see anything improper in it.

If you put plaster and wood in contact, is it an uncommon thing to find that the plaster will come away from the wood?—I do not recollect ever seeing such a thing before.

Cross-examination continued.

Plaster, of course, had to be put on damp. He did not admit that dry weather would affect it.

What causes a hair crack in a ceiling?—I do not know.

Is it the dry atmosphere on the plaster which causes it?—It might be.

Cross-examination continued.

He considered that the drawing-room ceiling was badly cracked. It had more than a hair crack. The china store cupboard was plugged to the wall, and he thought that the plugs had drawn out of the wall. It was a perfectly proper thing to put linoleum on wood block flooring, provided the flooring was dry when the linoleum was put on. He did not know when he went to Newton Hall, on July 19, that he was to give evidence in this case. He only knew the date when stamp paper was fixed to the cracks by seeing the dates written on the stamp paper in pencil. A good many of the doors which required to be eased were the doors to cupboards. It was not an uncommon thing to have to adjust the doors to cupboards.

The footman's room door required easing from the top. Great heat, no doubt, would affect joinery. He did not know that where the corner cupboards were the hot water pipes were which ran to the radiators; but it might be so.

Mr. John Murray, F.R.I.B.A., Principal Architect and Surveyor to the Commissioners of Woods and Forests in London, and architect to several public bodies, examined by Mr. Clavell Salter, said he had had some twenty-five years' experience, and on March 6 he was retained by the defendant in regard to the contract job in question. He visited Newton Hall on March 11, 13, 27, and 28, and on June 28 and 30. He on all those occasions made a careful inspection, and he had carefully perused the documents in the case, and made a report upon the matters in question. Referring to the roof over the new wing, he said his assistant had prepared a drawing of the roof of the new wing. In his judgment, the roof over the new wing was not properly framed. In his opinion, the timber and wood work was not of the best quality. Some of the timber had shakes in it, and some of it was sappy. The purlins were shaky. The curbs were shaky on both sides. He did not think that the timber of the roof had been subjected to any greater heat than a roof should be capable of bearing. The rafters, too,

had not been properly fitted. The rooms underneath were attic rooms in the roof, and the cross ties or collars of the roof formed the ceiling joists of the attics below. All the ties or collars were fastened to the rafters by spikes or nails, but in his opinion they ought to have been affixed by a half joint, which should also be spiked. He also thought that the spacing of the rafters was faulty. Two rafters, which bore the weight of the water tanks and bearings, were not capable of bearing the weight put upon them. Adjoining the new roof there was a bell turret. He did not think that the supports of that turret were sufficient. The roof plates bedded under the new roof ought to be affixed in some way to the horizontal joists of the second floor—tied in. The roofing felt used, too, was not, in his opinion, of the proper quality. He found that some of the slates had not been properly fixed. He found several of the slates defective. He did not consider the work round the bell turret was properly done.

Referring to the twin roof, the witness said that, in his opinion, it was not properly framed, and there were indications of continuing spreading. The rafters there were improperly fixed to the ridge also. It did not show good workmanship. He did not consider the timber used in the roof was of the best quality, and some of it he regarded as being very bad. Witness also referred in great detail to instances in which he said he did not consider the roof had been constructed in a proper and workmanlike manner.

In his opinion there were not proper and sufficient collars to the roof. Longer collars should have been fixed lower down to tie the purlins together.

Witness also gave evidence to the damage which had been caused by the sagging of the ceiling joists in certain cases. He said that in those cases there were no proper trimmers to the ceiling joists. He had examined throughout the whole house, and made a report upon the actual spacing of the floor joists, and rafters, and things of that kind. The joists did not run parallel as they should do, because they were very unevenly placed and spaced. He had made a very careful examination of the house for the purpose of finding out whether there had been any settlement of the floors. He found that there had been settlement of the floors, which he considered were serious settlements, and he had proved that the settlements had not ceased. The result was, that the ceilings had cracked very largely, and the partitions had also cracked seriously, and the joinery had opened very considerably at the joints. In his report, he had not mentioned mere hair cracks, nor had he put in all the cracks that he had seen. He attributed the cracks to the deflection of the floor above them. He had mentioned in his report the extent of the sags in the floors, and also the extent of the cracks in the ceilings and partitions.

On Friday, Mr. Murray was examined at great length and in great detail as to the alleged defects in the construction of the building, and the cause he assigned for the cracks which had appeared in the ceilings and partitions. He stated that he noticed a considerable increase in the cracks between the visit he made to Newton Hall on June 13 and the visit he made to the Hall last month. He noticed upon his visits in July that the stamp paper, which had been affixed to certain of the cracks upon an earlier occasion, had broken.

The witness said that, in his opinion, to remedy the defects in the construction of the building so as to make it conform with the contract and specification, it would be necessary to have the whole of the valuable furniture in the house removed.

Cross-examined by Mr. Lewis Thomas:

He did not draw himself, personally, every detailed drawing which went out of his office, but he never allowed a single drawing to go out of his office without seeing it first and revising it, if necessary. He had not troubled to find out whether there had been an order upon the plaintiff to put the soil pipes in where they were put, for the reason that he was only instructed to report upon the matter, whether the specification had been carried out or not.

Is it a good thing to subject newly constructed timber to severe heat?—It depends largely on the amount of heat.

Severe heat?—It depends upon what the amount of severe heat is. If you mean very excessive heat, I should say no.

Very excessive heat would be harmful to the timber?—I should say so.

Remember that this timber was put in in a very damp season—1910. In December, 1910, we hear that the temperature of the house was kept up to 84 degrees. Assuming that to be correct, was it fair to subject this timber with damp plaster in the house to a temperature of 84 degrees?

Witness replied that if the mean temperature of the house was kept at 84 degrees, he should say that it was not fair; but he did not understand that the whole of the house was kept at that temperature.

Mr. Clavell Salter said that the evidence showed that the understanding of the witness was correct.

Cross-examination continued.

In his opinion the whole of the timber in the building was not remarkably fine in the smoothness of the cut. It was not bright, to say the least about it. It was probable that it was in consequence of his opinion that the whole of the timber in the building was condemned; but he did not think that it was condemned on his opinion alone. He did not complain of the quality of the rafters, but of the way they were fixed. It was bad workmanship he complained of.

He had heard that the tanks were supplied to special order after the roof had been constructed. That fact did not modify his criticism as to the roof, because the roof could have been properly supported by proper means. Of course, if the contractor had been properly instructed to hang the tanks to the rafters, he would presume he was right.

Mr. Murray, further cross-examined by Mr. Lewis Thomas, said he admitted that Mr. Minter enjoyed a very high reputation for joinery work. He knew that Newton Hall was a house of a professor of art at Cambridge University. He did not suggest that because the house was a more or less show place that Mr. Minter would be less careful about his joinery work than elsewhere. He did not know that the whole of the wood used in the joinery work had been standing for over two years in Mr. Minter's yard. He admitted that a proportion of the joinery was first-class joinery work, but the whole of it was certainly not in his opinion.

Cross-examined as to the twin roof, the witness said that he considered that the joints of the roof were very imperfectly made.

Re-examined by Mr. Clavell Salter:

At the time he was appointed architect, on March 6, he knew that proceedings were going on. At least, he knew that something was going on, but he did not know what it was.

One general question as to the condition of the timber—not as to the quality. You have told my learned friend that excessive heat would tend to increase the number of shakes, that the rapid drying would tend to increase the number of shakes. Are the shakes in this timber of the number or kind you would expect to find in timber of good quality?—No.

It would not be first-class building to put in damp timber?—No.

On no account, replied the witness, could the tanks, battens, and rafters be described as being of the best quality.

If this house had been built of timber of the quality specified, and with the joists spaced as shown on the contract drawings and specification, would these defects, in your opinion, have appeared?—I consider that nearly all of them would not have appeared.

Cross-examination continued.

It was the fact that the rafters of the twin roof were composed of rafters of different lengths. In his view, as an experienced architect, it would not be right or reasonable to leave the sagged floors as they were.

With regard to the slating of the roofs, it was, speaking generally, the fact that he had found several defective slates. He had found the wall plates twisted in the tilting. To his mind that pointed to movement in the roof, which was due to some heavy weight strain. The scheme of reconstruction he had prepared in March or April was confirmed, in his opinion, afterwards, by what had subsequently happened. In plaster work hair cracks were practically unavoidable; but in his view the cracks which had appeared in the plaster work in the present case ought not to be found in first-class work.

Mr. William C. Easdale, examined, said he was a civil engineer and a member of the firm of Messrs. Shenton & Easdale, civil engineers, of Victoria-street, with great experience in drainage matters. Witness stated that, in accordance with instructions, he accompanied by an assistant, went in March last to Newton Hall to inspect the drainage constructed by the plaintiff, and gave evidence detailing defects he had found in the construction of the manholes, thickness of the concrete or masonry, cesspool, and other matters.

Cross-examined, he had been in business on his own account about two years. Before he went into business on his own account as a sanitary engineer, he had acted as the London representative of Messrs. Adams, sanitary engineers. He had expressed his disapproval of the land treatment of sewage, where the land was unsuitable; but he considered that land treatment was best where there was suitable land. He considered that the excavations

* Continued from p. 146.

had made did not affect the stability of construction where the construction was a. He had found that several lengths of m, which appeared in the drawings, had been omitted from the stable yard. He was not an expert in brickwork. He complained that two soil pipes had come inside the house. He admitted that he made a mistake there. He noticed that brickwork of the main part of the cesspool was open jointed. He did not notice the cesspool was constructed to a design a soak-a-way. He thought that a cesspool constructed as a soak-a-way ought to be protected by Act of Parliament. He did not know that the whole of the drainage work was done on "measure and value."

"This is a contract on 'measure and value' for material and labour." If anything else to go in it is at the expense of the employer, is it not?—Yes. Do you say that in these circumstances it is necessary to put in concrete under these pipes?—Yes, certainly.

He saw no sign that the sewage works had been improperly used.

Mr. Alexander Stenning, examined by Mr. John Salter, said he had been a surveyor for many years. He went down to Cowley Hill on July 20. He had examined the spacing of the floors, and found them to be as stated by Mr. Murray. He considered the spacing of the floors was a serious defect from the specification. He considered that the reduction of the strength of the standard provided for by the specification, was about 25 per cent. He found the first floor rooms and the attic rooms spaced upon the average at intervals exceeding 12 inches. He also found that partitions, instead of being wood partitions, were made of patent slab stuff. If they were timber frame partitions, they would be added to the strength of the floor above. He would have helped to take the weight. In his opinion, what is the cause of the sagging and the ceilings and partitions sinking? The insufficient strength of the joists as put in. Examination continued.

He thought that the sagging and cracks did increase as time went on. If nothing done to the floors, and the house continued to be occupied, it was not possible to say far the settlement would go, or what the effect it would be.

With regard to the roofing, the witness equally corroborated the evidence of Mr. Murray.

His witness, cross examined, said he visited Cowley Hill on July 20. He went down by the 1 o'clock train in the morning and returned London by the 4.40 train in the afternoon. Had plenty of time to go over the whole of the house. He had Mr. Murray's figures before him. With regard to the spacing of the floor joists, he relied generally on the evidence of Mr. Murray. He did not know if the joists he had inspected had been replaced in position by the order of the Board.

He replied to the Official Referee, Mr. Lewis, that the joists in that particular case had not, when Sir Alexander saw them, been fixed or permanently placed in position. The case was proceeding as we went to court.

FOREIGN AND COLONIAL.

Building Construction, Brazil.

The *Diario Official* of July 1 notifies that the *Diario* opened on August 21 at the expense of the "Quinta Divisão do Departamento da Guerra, Ministerio da Guerra." Rio Janeiro, for the erection of the main building intended for the Central Army Hospital in a deposit of 5,000 milreis (about 535*l*). He is required to qualify tenders.

St Official, Niteroy, Rio de Janeiro, Brazil.

The *Diario Official* of July 7, publishes a notice (No. 8,805) opening, in favour of the Ministry of Communications and Public Works, a credit of 557,000 milreis (about 60*l*), for the construction of a building intended for the Postal Telegraph Office in Niteroy, State of Rio de Janeiro.

Building in Turkey.

It appears from a recent report to his Excellency by the United States Consul at Beirut that building operations in that port have not kept pace with the growth of population. One cause of the increased demand for houses is that the Eastern habit of permitting several generations of a family to live in the same house, often a small one, is yielding to modern requirements,

and the son who marries now prefers a house of his own. Immigration from the Provinces is now rendered possible by the Constitution, which permits the people to establish their domicile wherever they wish. The fires in the congested quarters seem to destroy more buildings than the people erect. Various signs point toward an approaching "building boom" in Constantinople. There exists a strong demand for apartment houses, office buildings, and warehouses equipped with modern conveniences. Already many new buildings are planned. Five structures at Robert College, a new hotel, and three or four large buildings for the American College for girls, are all in course of erection, mostly of reinforced concrete. Articles for house construction, including structural iron, builders' hardware, galvanised tin and asbestos roofing, lifts, plumbers' supplies, lavatory fittings, should find a market. A list of British commission agents established in Constantinople may be obtained by British firms on application to the Commercial Intelligence Branch of the Board of Trade, 73, Rasinghall-street, London, E.C.

LONDON COUNCILS.

Acton.—The Highways Committee have decided to repair Warple-way, Acton Vale, with "Durax" paving, and Cressfield road with tar macadam, and application is to be made to the Local Government Board for sanction to a loan of 900*l*. and 600*l*. respectively, the estimated cost of the work.

Barnet.—The Council have agreed, subject to the usual sanction, to purchase the Old Barnet brewery at a cost of 1,000*l*. as a site for new Council offices. The Surveyor has been instructed to prepare plans and specifications for the erection of a further twenty-two cottages in Totteridge lane. The following plans have been passed:—Mr. F. W. Hackforth Jones, J.P., three houses, Arkley; Edmonton Co-operative Society, Ltd., look-up shop and store, High-street.

Baling.—500*l*. is to be spent in adapting the premises, 35, Bond-street, for offices for the Electricity Undertaking.

Edmonton.—The Guardians have instructed their architect to prepare plans and specifications for the erection of three workshops for the industrial training of children in schools at an estimated cost of 900*l*.

Finchley.—The following plans have been passed:—Mr. C. W. Scott, three houses, Fairalan-road; Mr. E. Evans, fourteen houses, Fairalan-avenue; Mr. C. H. Talbot, alterations and additions to No. 93, High-street, North Finchley.—A proposal is before the Council to negotiate for a suitable site for an open-air swimming bath.

Hendon.—The following plans have been passed by the Rural District Council:—Alterations and additions, "Duck in Pond" public house, for Messrs. Benskins. Proposed petrol store, High street, Edgware, for the Gas Lighting Improvement Company.

Hornsey.—The result of negotiations between the Borough Council, the County Council, and the Board of Education, in regard to the erection of a new secondary school for girls at Stroud Green, is that plans of the site are to be submitted not later than December 31 next, and plans of the building not later than December, 1912; also that the buildings are to be ready for occupation by September, 1914. The following plans have been passed:—Six houses, Danvers-road, for Mr. H. East, Redstone-road; Hornsey; additions, Hornsey Cottage Hospital, Park-road, for Mr. G. Lothbridge, Draper's-gardens, E.C.; cinematograph theatre, Wightman road, Harringay, for the Estate Land & House Company, Weston-park, Hornsey.

Islington.—The tender of Wm. Griffiths & Co., Ltd., has been accepted at 5,860*l*. for paving the margins of the carriageways in part of Green lanes, Newington Green, and Mild may Park. Repairs are to be carried out to the road paving of the carriageway of Hornsey-road, at an estimated cost of 200*l*. The blocks required are to be obtained from Messrs. Thos. Gabriel & Sons, Commercial-road, S.E.

Richmond.—Plans have been passed as follows by the Town Council:—Additions, Grafton House, Kew-road, for Messrs. Brewer, Smith, & Brewer; alterations, "Duke's Head," public house, for Messrs. Nowell, Parr, & Kates; three houses, West Park-road, for Messrs. Boore & Parker.

Sutton.—The following plans have been passed by the Rural Council:—Rebuilding Baptist Chapel, Bedford; the Trustees, Four houses, Dawley-road, Harlington; Messrs. Newbold & Stevens. Three cottages, Lale ham; Mr. Simpson.

Wutford.—The tender of Messrs. W. King & Son has been accepted by the Urban Council for private street works to Whippendell-road and Sydney-road, at 518*l*. 15*s*. and 192*l*. 2*s*. respectively. The following plans have been passed: Mission hall, Upper Paddock-road, for Mr. A. P. Ibbott; conversion of house into shop, Banbury-street, for Mr. E. Clifford; additions, Coleman House, Clarendon-road, for Mr. T. Febardy; house, stable, etc., Holywell-road, for Mr. T. Simmons; alteration of premises, Loates-lane, for Messrs. Downer & Sons; motor garage, Whippendell-road, for Mr. J. Wheeler. A plan has been lodged for a shop in Queen's-road, for Mrs. Kempton. The Rural Council has passed the following plans:—Alterations and additions, Porters Park Golf Club for the managers; buildings, Caldecote Towers, for Miss Tanner.

Wimbledon.—The Borough Surveyor has been instructed to obtain quotations for paving with soft wood blocks that portion of Merton-road between Holy Trinity Church and St. Winefred's Church. Mount-road and High-bury-road are to be made up at an estimated cost of 833*l*. and 573*l*. respectively, by the Highways Department. Tenders are to be invited for making up Gladstone-road-mews, Lucien road, Gordondale-road, Crescent gardens, The Crescent (Section 1), and The Crescent (Section 2). Instructions have been given to the Borough Electrical Engineer to lay electricity supply mains and house services in seven roads in the urban district of Merton, and as when he considers necessary. He has further been instructed to proceed with the laying of mains and other works necessary for giving a supply of electricity to the Maldens and Coombe Urban District, as soon as possible after the Wimbledon Electric Lighting (Extension) Order, 1911, has been confirmed by Parliament, and the loan to meet the cost of the works has been sanctioned by the Local Government Board. The following plans have been passed:—Rev. Canon Scoles, additions to Ursuline Convent, the Downs; Rev. C. P. Fynes Clinton, additions to Cottenham park Schools, Pepys road.

OBITUARY.

Mr. W. I. Last.

Mr. William Isaac Last, A.M.Inst.C.E., Science Director of the Victoria and Albert Museum, South Kensington, has just died at his residence in Onslow-crescent, London, S.W. Mr. Last was the eldest son of the late Isaac Glandfield Last, and was born at Dorchester in 1857. He was educated at Owens College, Manchester, and began work as a mechanical engineer in 1875. He became the senior Whitworth scholar in 1878, and was engaged in civil and mechanical work in England and South Africa till 1890, when he was appointed Keeper of the Machinery and Inventions Division of the South Kensington Museum and Senior Keeper in 1900. The deceased was at the time of his death an Associate Member of the Institute of Civil Engineers.

PATENTS.

APPLICATIONS PUBLISHED.*

- 19,380 of 1910.—Edward John Buckley: Dis-temper.
- 22,202 of 1910.—John Thomas Holl, John Holl, Alfred Holl, and James Holl: Cement or compound for cementing leather, wood, and the like, and for other purposes.
- 22,678 of 1910.—Hagop Agopian: Artesian wells.
- 24,072 of 1910.—Richard Henry Quine: Lavatory basins, bath basins, sinks, baths, and the like.
- 24,724 of 1910.—Walter Hawkes Cross: Door and gate latches.
- 26,530 of 1910.—James Alexander Mytton Watson: Folding frame work especially applicable for ladders, camp furniture, and the like.
- 678 of 1911.—William Zeehandelaar: Dis-charge valve mechanism for wash-hand basins, baths, and the like.
- 3,755 of 1911.—Theodore McKenna (A. J. Ellis, Incorporated): Hollow metal floors and the like.
- 5,857 of 1911.—Albert Henry Scherzer: Bascule or lift bridges.
- 6,113 of 1911.—Richard George Vaughan: Fasteners for windows, doors, boxes, and the like.
- 9,225 of 1911.—Cecil George McKellar: Water closet basins.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

4,556 of 1910.

SELECTED PATENTS.

4,556 of 1910.—Stanislaw Rechinowski: Caissons.

This relates to caissons and consists in connecting the ferro-concrete lateral walls of a caisson by a system of ties and struts. The arched part between the projections *b* has a thickness which is less than that of the abutments below. Iron beams *c* connect these abutments and take the resultant of any inclined thrust on them. Angle-iron members *b* are embedded in the concrete to form a series of composite arched beams, and are connected by members *d* with their respective base members *c*.

5,500 of 1910.—Peter Burd Jagger: Moulding posts or pipes and casting floors in situ.

This relates to a collapsible core for use in the manufacture of hollow concrete objects, such as telegraph posts, pipes and hollow floors, and partitions which consists of overlapping sections *a*, *b*, *c*, *d*, corresponding to the internal contour of the object to be moulded, and carrying slide bars *h* engaging spiders *f* mounted on the threaded ends of sections of a central supporting shaft *e*. The

5,500 of 1910.

slide bars *h* are inclined to the shaft *e*, so that an endlong movement of the spider *f* draws the sections together throughout the length of the mould, the inner sections *a*, *c* being drawn inwards at a quicker rate than the outer sections *b*, *d*. In the construction illustrated, the endlong movement is produced by the engagement of a rotatable fixed abutment nut on the screwed end of the shaft *e* with a fixed abutment, such as the projecting sides of the mould box or the end of the core.

5,562 of 1910.—Francis Ernest Gausset Lahagan: Reversible windows.

This relates to reversible windows and consists in the provision of windows *a*, centrally pivoted on vertical pivots *b*, *c*, and fitted with weather strips *h*, and fastened in the closed position by a latch lock *g*, the bevelled portion of the catch *f* being inside, so that the window fastens automatically, and cannot be opened from outside. The window may be held in

5,662 of 1910.

the reversed position by a hook *j* engaging with the knob *k*.

5,893 of 1910.—Herbert James Haskins: Chimney tops.

This relates to chimney tops which are formed with two or more lateral baffles, *s*, placed as to prevent wind from blowing directly into the shaft mouth. The bottoms of the opening incline downward from the shaft mouth, and the lower baffles are also inclined, the upper ones being horizontal. The baffles may be otherwise inclined, but in all cases their planes intersect imaginary lines drawn from the outer ends of the baffles to the opposite side of the shaft mouth.

6,554 of 1910. Thomas William Twyford: Water-valve preventers.

This relates to a valve in float-valve flushing cisterns, which is operated by an external pusher or slide, the inner end of which acts upon an inclined plane mounted on the valve

6,554 of 1910.

lever. The float valve *a* is suspended from the lever *c* and counterbalanced by a weight *f*. On the other end of the lever is fixed an inclined portion *j*. The piece *i* acting on this

is connected to the push-button, and is out of operative engagement by a spring arranged in the casing *h*.

6,924 of 1910.—Thomas Archer: Chimney tops.

This relates to chimney tops in which vane 3 and a half-dome 2 forming the

6,924 of 1910.

are arranged beneath a yoke or bridge. The axis 6 hangs in a ball bearing, and lower end works in a cross-bar.

RECENT SALES.—Continued on page 176.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xvi.; Auction Sales, xxii.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

* It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

TO CORRESPONDENTS.

NOTE.—All communications with respect to literary and artistic matters should be addressed to "THE EDITOR" (and not to any person by name); those relating to advertisements and other exclusively business matters should be addressed to "THE PUBLISHER," and not to the Editor.

All communications must be authenticated by the name and address of the sender, whether for publication or not. No notice can be taken of anonymous communications.

The responsibility of signed articles, letters, and papers read at meetings rests, of course, with the authors.

We cannot undertake to return rejected communications; and the Editor cannot be responsible for drawings, photographs, manuscripts, or other documents, or for models or samples, sent to or left at this office, unless he has specially asked for them.

All drawings sent to or left at this office for consideration should bear the owner's name and address on either the face or back of the drawing. Delay and inconvenience may result from inattention to this. Any commission to a contributor to write an article, or to execute or lend a drawing for publication, is given subject to the approval of the article or drawing, when received, by the Editor, who retains the right to reject it if unsatisfactory. The receipt by the author of a proof of an article in type does not necessarily imply its acceptance.

N.B.—Illustrations of the First Premiated Design in any important architectural competition will always be accepted for publication by the Editor, whether they have been formally asked for or not.

TENDERS.

Communications for insertion under this heading should be addressed to "The Editor," and must reach us not later than 10 a.m. on Thursday, [N.B.—We cannot publish Tenders unless authenticated either by the architect or the building owner; and we cannot publish announcements of Tenders accepted unless the amount of the Tender is stated, nor any list in which the lowest Tender is under 100, unless in some exceptional cases and for special reasons.]

* Denotes accepted. † Denotes provisionally accepted.

ASLACTON (Norfolk).—For alterations and improvements at Aslacton School:—
E. J. Smith, Bunwell..... £295

THE SURFACE TREATMENT OF CONCRETE BUILDINGS.

IN the art of architecture, which depends for its appeal so much upon the judicious use of the forms harmonised and sanctified by tradition, only with the greatest caution that can break away from the methods of design based on materials that have a long in use. From time to time new pleas have been put forward, the abandonment of all the "ekneyed" paraphernalia of design, the return to "first principles" design based on the embellishment of structure. Even the logical temperament of such a man as Viollet-le-Duc did prevent his coquetting with this idea. To the support this theory has given, it is now, we imagine, sufficiently credited to render its further continuation superfluous. With the introduction of a new building material the

point must always arise as to how far it can achieve expression independently of the traditional forms. It may take forms so nearly akin to the material it supplants as to render the transition easy and natural, but, on the other hand, it may involve such drastic changes of method as to necessitate a long experimental period before it comes into its own as a recognised means of attaining architectural effect. As with the Ionian Greeks, stone took time to assume the characteristic forms appropriate to its structural capacity, and as during the last century iron and steel were embellished with decoration borrowed from other materials, so at the present time the rapid development of concrete as a constructive material, due to the discovery of the monolithic combination of concrete and steel, presents to us the new

problem of the range of possible architectural expression in this monolithic type.

In order to avoid confusing the issues, we may at once dismiss from consideration all structures compounded of reinforced construction and the pre-existing methods of building and confine ourselves to those formed of concrete cast in moulds, which will probably enclose, in some manner or other, steel tension members. In regard to these there can clearly be but three possible systems on which the surface left by the removal of the moulds can be treated, as, while each of these is capable of almost infinite variety, it must either be by addition, by simple inaction, or by subtraction that the surface will be determined.

The first of these includes all such methods as plastering, tiling, and other

means used for concealing in whole or in part the surface left from the forms. In the case of the second, the forms must themselves be of a character giving the desired surface. In the third the materials used must be such that the erosion or dressing off leaves a face suitable for exposure.

We do not propose to enter into the question as to which of these three methods may be regarded the more legitimate as a means of architectural expression; indeed, we very much doubt if such a question can be discussed with any profit. Such attempts have so frequently been made, only to result in the bottom being knocked out of conclusions, apparently most closely reasoned out, by the man of genius, who, having ignored them, achieves his aim by processes which are not at the time explicable on any argumentative basis.

As might have been expected, most of the experimental work in all three methods has been done in the United States. There, for some years past, pottery designers have been working out decorative ornament suitable in scale and colour for the embellishment of concrete buildings. A general surface of tiling or of marble slabs, recognisable as slabs and not simulating masonry, has also been accepted in the U.S.A. and on the Continent; while more recently combinations of eroded surfaces with added decorations have been attempted.

Again, in the matter of untouched surfaces we have done little here at home in regard to any substitutes for the usual boarded forms, though in cases efforts have been made to produce a surface as clean and uniform as possible.

In the U.S.A. sheet metal forms are in use, having lines or a pattern to mark the edges—a distinct effort to impress on the building the method of its construction. On these lines an infinite variety of effect appears possible, the only limit being the restraining influence of the architects' taste. It might be considered, for example, appropriate to stiffen thin metal forms by a stamped grooving or pattern, and this would leave its impress on the face of the work, suggesting a sort of diaper in relief; again, the metal forms might be made to hold a kind of coarse mosaic, producing a result akin to the *opus reticulatum* of the Romans. It is obvious that we have by no means reached the limits of possibility in this direction.

Of late, more attention has been given to the system of removing the surface left by the forms, and a number of methods have been used for this purpose. The face may be treated with dilute hydrochloric acid, which removes the cement and exposes the aggregate. The sand blast leaves a larger proportion of the cement matrix exposed, and the same may be said of both the hand and pneumatic hammer work. If it is possible to remove the forms within twelve hours, scrubbing with a steel brush produces a texture much better in its effect than that left by the pneumatic hammer, which picks out the aggregate so that the colour of the matrix only is shown.

In the case of all buildings proposed to be treated by one of the methods of

erosion the selection of the aggregate is of the utmost importance; it should not be too varied in colour and its general tone should be considered; it may be of any shade desired, but a mixture is not only less effective in itself, but has the additional disadvantage that if not kept absolutely uniform the work will appear patchy and over variegated. The mixing and deposition of the concrete must also receive much closer attention than it would otherwise need, the aggregate requiring to be kept to an exact average in size throughout, and any ramming done with the greatest caution in order to avoid packing the stones closer in one part than another. Thus the preparation of concrete suitable for erosion is an operation demanding a degree of skill materially increasing the cost of the work.

No doubt in time reinforced concrete will take its own place, much as steel is doing at the present day, and will develop some legitimate mode of expression. The time will come in due course; to try to force the pace will only, in most cases, result in adding to the abortive efforts at architecture on "first principles" before referred to, but it is not amiss to keep in touch with any possible treatment for construction of this character, and among these the question of surface has a very definite importance. It will, of course, be readily recognised that it is by no means the only one, but as it appears to us to have been somewhat neglected in this country we have thought the moment an opportune one to draw the attention of our readers to the possibilities in this direction.

THE POSITION OF THE EXPERT WITNESS.

RECENT proceedings serve to remind us how rarely architects are asked to appear as witnesses, either before Parliamentary Committees or Courts of Justice, on matters that are purely architectural, or to give opinions on æsthetic questions.

Although it is customary for architects to appear as expert witnesses in the Courts, it is noticeable that they hardly ever appear in their essential character as skilled artistic constructors, but rather in that of surveyor, valuer, or authority on ancient lights, or party wall experts. It is not often that they are called upon to give evidence that might not equally well, or even better, be given by a building surveyor. To give evidence in the Courts on æsthetic questions of design is rare enough, to do so before a Parliamentary Committee is still more rare, and is, of course, a matter of even greater importance. We cannot pretend to be altogether satisfied with the present position of the architect under such circumstances, or with the procedure adopted to obtain his evidence. It would be more satisfactory from every point of view, we think, if, instead of allowing the promoters of a scheme to bring forward architectural evidence in its support, the Committee would appoint independent architects to study the whole question and report direct to the Committee itself.

This would ensure that every aspect of the case—the bad points as well as good—would be placed before the Committee in an exhaustive and absolutely unbiased and impartial manner, by bringing the whole of the truth to light, would not only be more in the interests of the public, but also in the interests of the architects themselves, as their position would be more pendent, dignified, and acceptable.

Even in the ordinary Courts of Justice where it is the custom for architects to appear as expert witnesses for one or the other to private litigation would, we think, be more in the interests of justice, and more in accordance with the dignity of architecture, if the rule held good, and architects only appeared to give information or opinion when called on by the Court. They should thus be spared the embarrassment of sight of eminent experts on opposite sides cancelling each other out, and doing nothing to further either interests of justice or of the profession of architecture.

Whatever justification there may be for the present system where private interests are concerned it would probably not be disputed that where public interests are involved they are best served when the architect appears only as a servant of the public to place his knowledge and skill at the service of the State.

NOTES.

School
Playgrounds.

THE President of the Board of Education has appointed a Committee to consider possible reasons for the modification of the rigid minimum of 30 ft. size of playground per scholar. It seems a very desirable thing that such questions should cease to be regarded as matters of routine with rules laid down as universally applicable, however varied conditions may be. The attention of the Committee is drawn to the influence that the proximity of recreation grounds or open spaces may have on a decision as to the area of playground needed, and it will at once strike those who have their eyes on the future that this problem is one in which our new town-planning schemes ought to be very helpful, providing the proper connexion between school buildings and public recreation grounds. A playground of this character, as distinct from the quiet park or reservation, is in its nature placed in conjunction with the school buildings, and the uses of both are enhanced by their mutual proximity.

The Royal
College of Art.

THE Departmental Committee appointed by the Board of Education to consider the question of "functions of constitution of the Royal College of Art," has now issued its Report. The Report was heralded by a circular which was referred to in our issue of July (p. 33), and which gave in outline views now set forth more fully in the Report. The Committee expresses its opinion that the artistic tests for admission of students do not result in securing the best, and it is pointed out, in localities possessing a strong

ustry utilising artistic work, designers in the district seem to be preferred those from the Royal College of Art, where local talent does not cover the whole ground bodies such as the Calico Printers' Association and the Wall Paper Manufacturers' Combine prefer to supplement their staff from abroad rather than in the Royal College. This neglect seems to be not wholly deserved considering the high standard shown in any of the designs produced at South Kensington, but the Committee feel that it is not without a reasonable basis that—

If the training of designers is to be kept close relations to the industries it must, in main, be carried on in the actual centres of those industries are located, and where the necessary equipment can, without reasonable expense, be made available."

They recommend:—
That the training of designers for the manufacturing industries should be specialised, and should be undertaken by provincial colleges, each of which, while continuing to provide general education in art, should devote special attention to the needs of the dominant industry in its locality, and to this end should take steps to associate with its work representative manufacturers and artisans belonging to the industry;

That these provincial colleges should be conducted as departments of colleges which deal with the practical and the scientific as well as the artistic sides of the dominant industries in its localities;

That when a system of provincial colleges is established, the relation of the Royal College of Art to such colleges should be that of a school advanced studies only, providing courses of one or two years' duration adapted to the individual needs of its scholars and in close relation to the Victoria and Albert Museum; That the training of teachers of art, wherever undertaken, should be conducted under conditions which will entail a higher standard of moral or technical as distinct from artistic attainments, and should include an adequate pedagogic preparation;

That Universities should be encouraged to provide suitable degree courses for intending artists, architects, and teachers of art."

meeting the contention that the adoption of these recommendations would have the effect of lowering the status of the Royal College, the Committee claims that, as a post-graduate college in close touch with the local art schools, it will serve for the first time a well-defined position as the culminating point of the whole system of industrial art-training in England.

Basements and By-laws. A CORRESPONDENT in the *Times* draws attention to a by-law stated to have been passed by the Marylebone local authorities providing that a room habitually used as a sleeping-place, the surface of the floor of which is more than 3 ft. below the surface of the street level, is to be deemed a dwelling-house so dangerous or injurious to health as to be unfit for human habitation, and points out the effect this by-law will have on metropolitan houses where men-servants sleep in the basements. As this letter might lead to a serious misapprehension as to the character of the by-law in question, we quote the paragraphs bearing on the case:—

"Such room shall in every part thereof have a height of at least 3 ft. of its height above the level of the surface of the street or ground adjoining nearest to such room: Provided that if the width of the area hereinafter mentioned is not less than the height of the room from the floor to the said surface, or is not less than 6 ft., the height of the room above such surface may be less than 3 ft., but not in any case less than 1 ft.

There shall be outside of and adjoining such room and extending along the entire frontage thereof and open upwards from 6 in. below the level of the floor thereof an area properly paved and effectually drained and at least 4 ft. wide in every part: Provided that the width of such area may be not less in any part than 3 ft., if the mean width of the area be not less than 4 ft."

Thus we see that its requirements are nothing more than is usual and reasonable, and though, of course, every hard-and-fast rule may appear to operate harshly in a few cases, it has long been recognised that the interests of a minority must not be permitted to stand in the way of enactments intended to benefit the community as a whole.

Trade Disputes and Picketing. IN view of the recent strikes in London, and the dislocation of all business which has ensued, the circular addressed by the Home Secretary to the Chief Constables is a document of considerable interest to all employers of labour. It is hardly necessary to point out that the "peaceful picketing" permitted by sect. 2 of the Trade Disputes Act, 1906, entirely loses its character when acts of intimidation or violence are resorted to; but some of the observations contained in the circular are of considerable importance. Thus the Home Secretary points out that in distinguishing between peaceful picketing and picketing which amounts to intimidation, and which is an offence under the Conspiracy and Protection of Property Act, 1875, the number of persons engaged in the picket is an element to be considered. If it is disproportionate to what should be needed for lawful purposes the protection of the Trade Disputes Act may cease to apply. A second point of importance is, as the circular points out, that the Trade Disputes Act, 1906, gives the picket no right to enter private premises, or to insist on interviewing any workman in private.

The Civil Aspect. THESE matters, the subject of the circular, relate to the criminal aspect of the question, but as regards the civil side we may draw our readers' attention to the decision of the House of Lords in *Conway v. Wade*.

fully noted the *Builder*, August 7, 1909. That decision laid it down that the right of civil action was only taken away by the Trade Disputes Act, where there were no threats or violence; and that where contracts are broken, or there is interference with any trade or business then even a peaceful act can only be justified under the Act when it is done with a view to a dispute which is imminent or in support of an existing dispute.

THE STORY OF THE BRIDGE.

By WALTER SHAW SPARROW.

II.—THE ROMAN GENIUS.

ROMAN aqueducts and bridges, says an authority, "were really of a more engineering than architectural character, being in the main utilitarian." What does that mean? Was a Roman temple less utilitarian than a Roman aqueduct? Less needful as a part of the national life? But, when a lover of Greek art tries to write on the Roman genius, very absurd things are often uttered. Thus we are told by the same authority that the Pont du Gard, near Nîmes, in France, is built of "rough masonry." What next? Sandow, in comparison with a Tom Thumb, is a man of rough muscle and sinew, and if Tom Thumb is to be our standard of symmetry and grace, then Sandow is a masterful mistake in proportion and vitality. To describe the Pont du Gard as "rough" is to be a Tom Thumb in criticism.

Who knows why Anglo-Saxons are so reluctant to admire in art those very qualities that win victories and promise a great future? Why is it that our criticisms of art are sweetened with such words as "sentiment," "refinement," "gracious and gentle tact," when there are qualities of a higher kind, not only manlier, but more heroic? The Roman genius, in such magnificent monuments as the Pont du Gard, is the very tonic for which we ought to have a natural liking. Yet a professor of taste finds it "rough," just as bad climbers speak of the Alps disrespectfully.

When J. J. Rousseau visited the Pont du Gard he was awed into silence by the immensity of the three arcades. For the first time in his life he understood the grandeur of the Roman spirit in adventurous achievement. As he walked along each arcade the echo of his footsteps enabled him to hear the great voice of the builders. How had all the large stones been brought to this place, in a neighbourhood where quarries

Pont du Gard, Nîmes, France.

seem to have been unknown? And whence came the art that piled them up into a silencing design? Each stone was laid in its allotted place quite dry; neither mortar nor cement was employed, except as a lining to the water-channel on the third tier. Rousseau spent hour after hour in meditation, and then he remembered a humorous fact. He had been warned against the beautiful girls of Montpellier, and here he was alone with the Pont du Gard, and completely fascinated!

A classic tradition says that the stones in the Pont du Gard were joined together by iron bands. Is that true? The iron clamps, if employed by the masons, were not left on the surface of the stones, for there's no reference to them in the writings of modern students and travellers. That the Romans did use iron bars bent at the ends and fastened into huge stones with molten lead is proved by the ruins of the Roman bridge over the North Tyne at Chollerford, near Hexham. This was probably a bridge with a wooden superstructure, as voussoirs have not been found among the *débris* of stones. You will find full information in Dr. Bruce's book on "The Roman Wall," and in "An Account of the Roman Antiquities preserved at Chesters, Northumberland," by E. A. Wallis Budge.

The Pont du Gard is immense, its height being not less than 47 metres and 20 centimetres. The first tier has six arches, the second has eleven, and the third thirty-five. The first tier is 20 m. 10 cm. high and 161 m. 80 cm. in length; while the middle tier is 19 m. 40 cm. in height, and 257 m. 90 cm. long. Note, too, that the architectural centre of the design is not the real centre; this was determined by the course of the River Gardon, and we find it on the north in the second arch of the first bridge, the arch under which the river flows. It has a span of 25 m. 30 cm., while the neighbour on each side is smaller and narrower, having a chord of 19 m. 20 cm. The other arches of the first tier dwindle to 15 m. 75 cm. in span. As to the centre of the second story, it corresponds with the first, for the largest vault is above the river; it carries four little arches of the third arcade, while the others support only three. Thus the symmetry of the whole work must be judged in its relation to these facts. Some critics see nothing more than the unequal size of the arcades, when the real point is to find the *milieu architectural*, whence the design radiates, majestic and imperious. Fergusson said very well that the topmost arches give to the structure the same finish and effect

that an entablature and cornice give to a long range of columns.

We cannot put a date on the Pont du Gard because there are differences of opinion in this matter. The historian of Nîmes, M. Ménard, attributes the work to Agrippa, son-in-law of Augustus, who is said to have ordered its construction in the nineteenth year B.C. The style belongs to the Tuscan order, and all the arcades are groined and semicircular. The curve of every arch springs from a ledge, an impost resembling a cyma, about 50 centimetres high, and as much in projection. There are four groins in the arches of the first tier, and three in the second, while the third tier has either one or two. The water channel, placed on top of the third arcade, is 1 m. 30 cm. wide and 1 m. 60 cm. high; has side walls with perpendicular stones, and these bonders, 0 m. 80 cm. in size, bear cemented flagstones, a metre wide and having a thickness of 0 m. 32 cm. The channel itself is nearly blocked up with a thick deposit of lime, but when this substance is detached antiquaries find on the side walls a deep layer of cement painted red. The bed of the canal is a solid floor 0 m. 22 cm. in thickness, its component parts being small pebbles mixed with lime and gritty sand.

The Pont du Gard, like other antique monuments, has suffered from a competition between mankind and the centuries. The hand of time is difficult and ravaging, but men are more to be feared in their vandalism. At the end of the XVIIth century, during years of religious persecution, the Pont du Gard was often crowded with fugitives and with troops, who detached stones both from the piers of the second arcade and from the heads of the arches in the first tier. These injuries were all on the side that looked upstream. The aim was to enlarge the footway on the right-hand side of the piers, by means of a structure or platform corbelled out from new imposts. Along this road cavalry and artillery passed at full speed, shaking the bridge and causing the topmost tier to develop a curve in its horizontal parapet. At last the province of Languedoc interfered, and in 1670 careful restoration was begun. Only a small road was left open on the first bridge, and this was kept for horsemen and foot-passengers.

Years later, in 1743, the *états généraux* decided that a public bridge should be built up against the eastern side of the Pont du Gard; this was done without harming the Roman monument; and the new bridge, finished in 1747, may have been justified by its alleged necessity. There have been some modern restorations to the Pont du Gard,

and one day the aqueduct itself may be brought into use again, in accordance with the wishes expressed by engineers during the last half-century.

We pass on now to another Roman bridge, at Vaison in Vaucluse. It is a bridge of stone over the River Ouvèze, and its span measures 30 metres. Vaison is built in part with materials from a Roman town, Vaison la capitale de Vaconces, and its antique monuments are famous in France. Thus the church of Sainte-Marie, built between the Xth century and the XIIth, preserves some genuine Roman cloisters, and there are ruins of a Roman theatre. I give here a good photograph of the bridge, showing in detail the mason's craftsmanship.

Another Roman bridge, not generally known, is found at Pollenza, in the island of Majorca. It has two arches. One semicircular, and springs from the river-bed, while the other is a long segment arch stretching from an abutment wall on the bankside to the buttress guarding the pier. Above the buttress is a small archway break the force of a flooding river. This what the French call an *arche de décharge pour les hautes eaux*. To find it in a Roman bridge is interesting, for it gives a classic origin to the use of discharge arches in mediæval bridge-building.

Much larger and more impressive is the probable Roman bridge at Viviers, in France (*Ardèche*), built mainly with pebbles and small stones. Photographs show clearly the workmanship, and I give here a view of the west side. Viviers is only a village to-day with less than 2,000 inhabitants; but in the Middle Ages it was a cathedral city, with pride much greater than its population which numbered 15,000. The Roman name for it was Alba Augusta, but its Roman civilisation was destroyed by the Vandals in the Vth century, and another type of society came to life amid the ruins, the old bridge remaining as a bond of distant union between past and present.

Viollet-le-Duc believed that the Romans in their colonies built few bridges of stone, preferring timber because it was always plentiful and easier to use. The old Gaulish methods of bridge-building, though primitive were strong, and the practical Romans would not hesitate to employ native traditions and craftsmen. That there was no opposition to useful primitive methods is proved by the fact that the Gaulish craft of bridge-building has outlived the Roman domination by many centuries; it may be seen to this day in Savoy. Viollet-le-Duc drew attention to this circumstance, and said with truth that timber bridges in Savoy descended not merely from the workmanship described by Julius Caesar, but from some remote age in prehistoric time. Note, too, with interest, that the timber piers are constructed like those at Srinagar, in Kashmir, which (as I mentioned in my first article) appeal to us as primeval carpentry in the likelihood developed from the log foundations of lake-dwellings. It is quite an easy thing to make a bridge in the Gaulish fashion. You choose a river with steep banks, just wide enough for a single span. On each bank you make a bed of flat boulders, and then begin to raise up your timber pieces using tree-trunks laid in a criss-cross manner. In order that the footway from pier to pier may not be too long, and therefore unstable, you increase the length of your horizontal logs as the piers rise in height; and because these logs on each side jut farther and farther across the water a rude arch is suggested by them, not a perfect arch, since the timbering of the footway gives it a flattened head. The inconvenience of a long footway in a wooden bridge may have suggested this method of pier-building to prehistoric craftsmen. If so, how are we to think of it in relation to the origin of arches? On the other hand, prehistoric timber piers may have had the same width all the way up; perhaps the progress of architecture in Roman and in Indian work suggested the use of longer logs to project

Roman Aqueduct, Segovia.

ver the water, and to make at last a jutting support under the timbers of a footway.

From the rarity of Roman bridges in Great Britain we learn that wood was the material used in early historic times. Do we possess even three or four Roman bridges with an authentic record? Here and there local traditions attribute a bridge to the Romans, but how many do you know having the support of distinguished antiquaries? A good many along the Roman roads have Romanesque traits, but I should like to find a true example of Roman craftsmanship. By my side I have a photograph of a supposed Roman bridge at Monzie, near Crieff, in Perthshire, with an arched footway overgrown with ferns and grasses. The type appears to be Roman, like the so-called Roman bridges near Bettws-y-Coed; but is the work as old as the XIIIth century?

In my search for Roman bridges in Great Britain I have consulted Mr. C. S. Sargisson, who has photographed and studied a great many important bridges in England, and who has added many prints to my collection of photographs. It was he who first drew my attention to the Roman bridge of a single round arch near Colne, Clitheroe, concerning which there seems to be no doubt in the opinions expressed by antiquarians. Its simple design is finer in aspect than the "New Port" at Lincoln, which is unquestionably Roman. The strong arch-stones have no masonry above them, but the footway is protected by large cobbles which are easy to displace when they become outworn. The width of the footway may have been wide enough for a British war-harriot or a Roman cart, which were very narrow, seemingly.

Along the old Roman tracks in Lancashire there are many single-arch bridges having a Roman character, but without a stalwart air of authentic dignity. The one near Clitheroe looks genuine, while the others speak to me of a Roman tradition enfeebled in much later days by a different spirit in craftsmanship.

For the rest, many persons believe that Roman bridges have roadways either perfectly level, like that in the noble bridge across the Tagus at Alcantara, or else semi-circular over a single arch. But there is another type, and it may be studied in the five-arched bridge built by Augustus at Rimini, where the roadway ascends to the middle of the central arches, and then goes downwards. Medieval architects borrowed this method of construction for reasons to be given later; and we shall see also how other characteristics descended from Rome to the Middle Ages and to our own times.

WORKMEN'S INSTITUTE, ABERTRIDWR.

This building, which was opened last week, has been erected at a cost of about 8,000l., and includes a library. The architect for the work was Alderman Illyd Thomas, and the contractor, Mr. John Williams.

INTERNATIONAL CONGRESS OF ARCHITECTS, ROME.

THE Ninth International Congress of Architects will be held in Rome from October 2 to 10. It was agreed at the Congress of Vienna that this meeting, the ninth of its kind, should be convened in Rome on the occasion of the festivities in Italy, organised to commemorate the fiftieth anniversary of the proclamation of Rome as capital of the kingdom. The eight preceding, of which the first was held in 1867, met in Paris, Brussels, Madrid, London, and lastly in Vienna.

H.M. the King of Italy has acceded to the wishes of the Committee in accepting the patronage of this Congress, and the Ministers of Foreign Affairs, of Public Instruction, and of Art have consented to act as honorary presidents.

By permission of the Syndic of Rome, the Congress will be inaugurated in the historic Hall of the Horatii and Curiatii. The following subjects will be considered:—

Reinforced concrete, the mode of using it in different countries, and how it may be applied to great buildings both as regards the technical and the decorative point of view.

Duties and rights of the architect with regard to his employer.

The technical and artistic education of the architect, and the architect's diploma. The exercise of his profession beyond the limits of his own country.

Considerations as to modern architecture. The carrying out of architectural works for the State or other public bodies.

The desirability of a dictionary of comparative architectural terminology. Foreign academies in Rome. (History course of study and works of the pupils. Their influence in their respective countries.)

Written communications and lectures are admissible on the following subjects:—

"Plans for the Laying out and Aesthetics of Towns"; "Building Regulations."

The Committee will be obliged to all those who will furnish written articles on these subjects, to be sent in before August 15 next, accompanied by a summary in one of the four languages to be employed in the discussions of the Congress, viz., French, English, Italian, and German.

The subscription for full members is 12l., and for associates, being members of the family (wives, sons, or daughters) of a member, 12s. Both members and associates have the privilege of admission to:—A reception to be given by the International Association of Artists; a reception at the Capitol; a picnic (olobrat); a garden party; and probably to other important receptions.

Members will be shown round Rome and the Exhibitions under qualified guidance. Excursions to the environs (including lunch), will be arranged at a small payment. There will be special banquets and a lunch for official delegates and their wives; also the usual closing banquet, for which tickets can be obtained by payment. Tickets of admission to the museums will be distributed.

A party of members and associates will

leave London on September 29, the itinerary being as follows:—

Friday, September 29.—Leave London (Charing Cross Station), 9 a.m., by the short sea route Dover and Calais for Paris, continuing by evening express for Genoa.

Saturday, September 30.—Arrive Genoa, where the night will be spent.

Sunday, October 1.—Leave Genoa by morning express for Rome, arriving the same evening.

Monday, October 2, to Wednesday, October 11.—In Rome. Members will be able to return to London at their own leisure, within the validity of the tickets, i.e., twenty-five days.

The fare will be 14l. 18s., providing second-class travel ticket, with first-class on steamer from London, via Calais, Paris, and Modane to Rome and back; hotel accommodation; omnibus transfers; fees to hotel servants, railway porters, etc.; free conveyance of 55 lb. of baggage (while travelling with the courier); the services of a qualified courier.

The courier will return on the morning of October 11, and any members desiring to return at the same time will have the benefit of his services during the journey, and of free conveyance of baggage as above; but meals, hotel accommodation, fees, or transfers on the return journey are not included in the fare. The members would have to travel together on the outward journey to Rome.

Superior hotel accommodation can be provided at an increased fare, and independent travel tickets can be had at an extra cost.

Mr. John W. Simpson, Vice-President, R.I.B.A., is acting as Secrétaire, Comité Permanent International des Architectes.

TRAINING AND REWARDS.

The ultimate guidance of study rests with those who bestow reward.

The donkey is more effectively directed by those who offer inducement than by those who tweak his tail; and if our masters in their capacity as educationists may be regarded as tweekers, in their more potent function they are the controllers of our studentships and prizes. Now they must of necessity be men of standing, though not therefore qualified to judge, or—since that is begging the question—if qualified, their judgment may through knowledge of the power they possess be informed with a determination to uphold what they regard as desirable though perhaps contrary to—it may be better than—the common view. Students of architecture suffer little in precisely this way. It may seem at times that they do; results, external evidence, may lead to that conclusion. But although the effect may be the same to all appearance, yet it proceeds from an opposite cause. It is not that those who are responsible for an award which, if not indefensible, is certainly susceptible of objection, are using their tremendous lever steadily with some concealed subversive intent. No. That were too purposeful. In vain do we seek the sinister in a merely muddled land. It is because, as far as one can judge, they are unaware of what they might do, that they have, as a body, no purpose at all, and must therefore act as seems to them best on each occasion, on a frankly opportunistic basis, which is no basis at all.

Necessity of Organisation.

Now at a time when there is a consensus of conviction as to what is good, nothing more would be required, or that is to say, so much would be impossible, opportunism being extinct. But at this present, when architectural aspiration in this country is pulling itself together again, but while the slime of the morass in which it has floundered is still, here and there, termed evidence of the affluence of romance, if not divine, some definite coherence must subsist in the matter of the bestowal of studentships, if the force therein is to be exerted for advance. But the jury must be composed of men of accepted standing, and standing has for most men come with time and the times are changing fast. Are they to abandon recognition of the ideals which fired their youth and bestowed their favour upon the fashion of the day? Some will stand fast, though silent perhaps, others will "keep pace with the spirit of the age," others there will be on our jury who lead the van of the movement. Is it to be supposed that awards of such a body can, in the mass, effect any inducement to progression, other than the indirect one of dissuading the conscientious student from spending time to no purpose?

What Happens.

The incoherent and aesthetically feckless condition of the jury—and by this we mean not only the Committees of the Institute, but the Alexander Thomson trustees, the Council of the Royal Academy, and those who sit in

judgment at all the other schools—the condition of this jury is sufficiently concealed. Its decisions become evident at different times and places, and in each instance the probability is that the students themselves and the small public immediately concerned are at least as liable to decisions themselves. Then there are, we suppose, rare instances in which the palm goes to a design which may be plain, may be poor in detail, feebly or unfashionably drawn even, and yet be essentially right, and the numerous instances in which a design, vigorously presented is so held on all hands to be the best that few save the vanquished look into it at all, and some even of these do so but to stand, awed and agape.

Setting the Problem.

Preliminary to and yet integral with the wielding of our weapon for the fashioning of architectural education comes the setting of the problems in terms which indicate the nature of their solution. Even the name of the object to be designed alone counts for much. Plainly, from those who are asked to design a cow-hyres a kind of architectural fervour is demanded other than that desirable in those who are to draw a cathedral. And either of these edifices, and all those kinds which lie between, may be required in terms which indicate that the student is to design "big" or on the contrary that the committee in question is steeped in regard for the petty practicalities of the problem.

The Two Principles.

There are two ways of setting a problem, or rather of conceiving it. The one says, "Let us give him a free hand." The result is: "Design a building on a perfectly flat desert of no particular climate or social associations, and which lacks the point of the compass, though it may indeed be considered to have a sun fixedly shining at an angle of forty-five degrees." The other considers "that limitations are so jolly helpful," and proceeds to set a problem in the nature of a puzzle, involving in the attainment of its one solution a concentration on the details of small planning, in excess of the customary tedium of actual practice. And it happens that this year, among the prizes open, without fee, to all British subjects, there are two good and two bad examples of each kind. For both the "Free hand" and the "helpful limitations" principles may be either right or wrong—one is prepared to prove either contention; but if they are wrong they may be justified, and if right equally betrayed, in application.

One Principle, the R.I.B.A.

To the first or *carte blanche* (or as white as may be in an imperfect world) school belong the two important studentships controlled by the Royal Institute of British Architects—the "Soane" and the "Tite." And of these two the "Soane" considered empirically as a detached subject, seems to us to be very well set indeed. A Guild Hall. It is to be placed in a park, some distance from the road, and the approximate requirements for the main parts are furnished, while the list of subsidiary rooms indicates the nature of the building without in the least hindering the glorification of design. Which is surely fitting as far as it goes, for the site is given in a public park—no place for the too precise limitations of a building line. For the "Tite," on the other hand, the student must design the central courtyard of a Royal Exchange covered with a roof—a legitimate region for adornment with classic forms, and one offering sufficient scope for design according to the terms of Sir William's will. But before the competitor can begin he must set himself the problem. True, some slight indication of the kind of rooms that must open into it is given; but for these the student will look up actual instances. Messrs. Mearns & Simons' Cotton Exchange at Liverpool being perhaps the most suitable. But of what shape is this courtyard to be? Round, square, oblong, triangular, octagonal—any of these and others?—and of what dimensions? How shall any jury judge between them? A problem which is not set cannot be solved—a truism of which we regret the necessity of statement.

Instance of the Other.

The trustees of the Alexander Thomson Memorial and the Council of the Royal Academy on the other hand are decided that, even at some cost, the designs submitted for their

adjudication shall have much in common to the end that their merits may be fairly assessed. And this view may be as right as the other; indeed as we state it in words it seems the better of the two. The proof of the principle lies, however, in the justice of its application. The Thomson prize is to be for a "Bridge, with approaches, spanning a river 500 ft. wide, with a terrace on either side, 50 ft. wide. Width and camber of the bridge, heights of road, terrace, and river—which is tidal (a legitimate difficulty), the range being stated—and a plan and section of the whole, that nothing may be doubtful, is given. The medium in which the drawings shall be made is prescribed. The intention of the trustees is defined. And yet the problem is a matter for spacious architecture, real enough, but shorn of the detail attendant upon actual practice. Some grand things should result.

Royal Academy Gold Medal.

How different is the subject for the Gold Medal of the Royal Academy! On a certain area round the three confined sides of a city site, to design a hall for a "city company." The accommodation required is precisely given and the disposition of the parts is specified to a degree which prevents variety of solution to those who obey the conditions. So that the task of the unfortunate students who are eligible to compete this year for a prize, in the administration of which, if of any at all, there is surely scope for large conception and some splash of design, is to resolve as well as they can a series of Chinese puzzles in which given cubes must be somehow fitted together, with due regard in this case to the psychology of a beadle, the dignity of a clerk, and some misgiving concerning the type of lady who will sit in the stipulated gallery to watch her men folk feed. The clients have said, "Here is our site. We want a forecourt in the middle and it must be so big. We want our dining hall of these dimensions, and there is just room at one point to place it. We require such and such rooms besides, and you must place them here and here. In short, nothing remains for you but to fit them in (being careful of your cupboards), and provide the architectural titillation and see that there is plenty of it, for we are rich." Which resolves the struggle for the fastest architectural studentship in the country into an affair of who shall draw the best detail and decoration, of a style and degree not specified.

Advice to the Student.

But let the student not despair in the case of the Gold Medal and the Tite prize, or hope unduly because of the seeming excellence of the Soane or the Alexander Thomson. Let him, not too flagrant violating the conditions, design in any style he pleases, with due deference to the contemporary modes, for which he should consult the works submitted in recent competitions, for this is politic. Let him not bother too much about the plan, so that it but have axes enough and symmetrical rooms. The correlation of plan and elevation need not imperil either, for drawings of each will be made on separate sheets. And as regards these sheets, let him compose each one pleasingly as a thing in itself. Above all must he draw. Let him display great slickness with his pencil, astounding ingenuity with watered ink; let him boldly flood colour and make shaded shadows in the Beaux-Arts way. And then, if the result be striking at twenty yards, let him send it in and abide the outcome, like a true sportsman, who, doing his best, yet waits on fickle fortune. For if there is any common quality to be discerned in the successes, worthy or unworthy, of recent years, it is that of the poster which hits the eye, or of the draughtsmanship that intrigues the emotion of wonder.

What is Lacking.

How the student who has any conception of the meaning of architecture—if indeed we may assume it to have any significance at all—how such a one must long for the real problem, adequately conditioned by those who understand. How must he desire in the case of the "Soane," for instance, not for more dimensions or a limit of cost, but for some indication of the nature of the place in which it is to be put. It is a Guild Hall, embodiment of the city, outcome of that city's history and symbol of its present state. The city is in an old country or a new, it is Latin or Teutonic, it is commercial or it is not, it is Northern or it is Southern. And these are only some of the main headings of the infinitely varying

circumstances and conditions out of which the real architect will fashion his design, of the essential materials with which he must build. Yet not one of them is hinted at. In the case of the courtyard of a Royal Exchange, a much more prosaic matter, besides the lack of material conditions we noted above, the same absence of consciousness that anything more is required is evident; but not to quite the same extent, because there is less in the subject, commerce being a common and cosmopolitan affair. Concerning the Bridge, one asks many of the questions that centre round the Guild Hall; and as regards the design for the hall of a city company, the necessity for knowing all those things and much more must beset our student hopelessly. How will it be possible to judge between the assembled designs? As we have pointed out, it must be mainly in detail and drawing that any differences between them lie. But the very craft or trade that this detail must glorify is in no way indicated. Our students are to believe that architecture is built of bricks made entirely with straw.

The Discrepancy.

Indeed they may find in the conduct year after year of these bequests for the advancement of architecture just that utter ignorance or carelessness of the quality that is vitality in the art, which by using their eyes in almost any of our streets they may see. Our student discovers that instead of working by the light of his synthetic concept, he being of a newer generation, he must, if he would profit by the studentships at all, endeavour to fashion in the chaotic atmosphere of an analytic age, something to meet the approval of those to whom that atmosphere is the breath of life. We do not wish to imply that that life was not estimable, that chaos was not inevitable, that analysis was not desirable in the extreme; but all the foregoing leads to insistence on our contention, that in architectural matters the intellectual confusion and centrifugal endeavour of the last three-quarters of a century is giving place to a synthetic concept based on a knowledge of all the styles to be built with the aid of all the mechanical discoveries of the age. Decorated building is not easily induced to lie, and, despite the able efforts of our leading architects, it has some sorry tales to tell posterity of the intellectual and spiritual condition of their one great client during the last hundred years. But now in the body politic there are signs that the turmoil and abating chaos is resolving; on every hand ideas of co-ordination and co-operation are gaining ground; the advance of that which is social, in a word, as opposed to that which is anarchic, is being recognised as the tendency of the period.

Conclusion.

The story of the rise and growth of this tendency will be told inevitably in due course in architectural terms. But it seems to us a pity that at a time when the co-ordination of architectural education and the consolidation of the profession is being so much discussed, and the regulation of work done by travelling students to the end that eventually an ordered survey of the world's architecture may be obtained, is already *en tapie* as a practicable thing, that the preliminary condition, what we have named the *ultimate guidance*, or the due manipulation of reward, should be wielded to no purpose save that of its own distribution. "What would you?" will be the form in which objection to the gist of our remarks will be raised. We hope to be able to reply with the publication of a scheme, which, because it will be but an extension of what is already being thought, said, and done, will cause no great consternation.

THE RELATION OF BUILDINGS TO SITE VALUE.

IN the House of Commons on Monday, last week, Mr. Cassel asked the Chancellor of the Exchequer whether his attention had been called to the view that buildings could not increase in value apart from a rise in the cost of material and labour, and whether calculations, for the purpose of arriving at site value on an occasion for collection of increment duty, proceeded on that footing. The Chancellor of the Exchequer.—The answer to the first part of the question is in the affirmative. As regards the second part, the method of arriving at the site value on an occasion is that prescribed by Section 2 of the Finance (1909-10) Act, 1910, and is fully explained in the Instruction to Valuers dated January 21, 1911.

THE ROYAL ARCHÆOLOGICAL INSTITUTE IN SOUTH WALES.*

TUESDAY, August 1, was devoted to the visit to the castles and fortified houses around Caerboron, the Coburg Hotel in motor omnibuses, the party first visited the very perfect remains of Carew Castle. The history of this was briefly described by Mr. Edward Laws, who said that the castle was formed part of the dower of Nesta, wife of Rhys ap Ithel, who married Gerald of Windsor early in the thirteenth century. The oldest buildings on the castle were, however, of the thirteenth and fourteenth centuries. During the reign of Henry VII. considerable changes were made in the hall and entrance front by Sir Rhys ap Thomas, and again *temp.* Queen Mary by Sir John Popham, who added the unfinished gallery along the north front. Some remarks were added by Mr. Hope, who pointed out that the castle was practically a fortified house, the buildings arranged about a quadrangular court. The most ornamental details belonged to the changes made by Sir Rhys ap Thomas, and could be approximately dated by heraldry on the hall porch, consisting of the arms of King Henry VII., between those of the Prince of Wales, and his bride, the Infante of Aragon, to the end of the year 1502, or early in 1502. It is much to be wished that proper plans of this interesting house could be undertaken by some competent person. Carew Castle stands a tall and very perfect Celtic cross with interlacing knotwork and inscription. Monkton Priory Church was next visited and described by the Rev. D. Bowen. It consists of an aisleless presbytery and nave with a tower between, with a detached chapel on the north, and once belonged to the Abbey of St. Albans. Until a few years ago the choir or monastic portion was separated from the rest of the church by a wall, unroofed and ruinous. It has since been cleared and added to the parochial nave. Pembroke Castle formed the next item, and was described by Mr. Hope. It occupies the eastern end of the long and narrow fortified island upon which Pembroke stands, and is placed on a lofty rock nearly surrounded by water. The castle is said to have been founded here by Rhys ap Ithel about 1105, but Mr. Hope was unable to recognize any earlier work than the end of the thirteenth century or even later. The castle consists of an outer ward entered by a strong gatehouse, and of a smaller inner ward which also had its gatehouse, now destroyed. The ward was protected by an interesting guardhouse on the west, with a chapel attached to its north side. The most striking feature after the gatehouse is the large and lofty detached tower in the inner ward which formed the church, and is almost unique as such in this country. North-east of it against the castle wall are the ruined remains of the great hall and other buildings, all of which deserve careful planning. The building in the outer ward in which Henry VII. was born probably dated on its western side, where extensive foundations remain buried. After luncheon, the journey was continued to Lamphey Palace, which was described by Mr. Laws as one of the residences of the Bishops of St. David's. The oldest parts may be of the thirteenth century, considerable additions were made by Bishop Herbert (1528-47), and further minor changes by Walter Devereux, Viscount Hereford, to whom it was given by Henry VIII. The principal remains are those of the chapel and with a range of lodgings to the east, all raised on cellars or subvaults, but the whole is so covered with ivy and creeping plants that it is difficult to distinguish details. Manorbie Castle was next visited. It is of various dates, chiefly noteworthy for the pointed barrel vault to the nave and transepts, and for the tiled wooden canopy over the place of the altar in the north aisle of the nave. The tower occupies an unusual position on the north side of the chancel. Manorbie Castle is another fortified house, the origin of which is assigned to Gerald of Windsor, but contains nothing earlier than the end of the thirteenth century. The house and curtain walls and towers are still very perfect, but the main buildings have been much ruined, with the exception of the tower and its sub-vault. Part of the buildings forming the gatehouse were converted into a dwelling by the late owner, Mr. J. R. Cobb. After the return journey to Tenby a halt was made at the charming house and garden at Porth, where the party was entertained at tea

by Lord and Lady St. David's. In the evening, the annual general meeting was held, when the place of meeting for next year was discussed. The general feeling was in favour of Northamptonshire, with Market Harborough as a possible centre, but the final choice was, as usual, left to the Council. At the concluding meeting, which followed, votes of thanks were accorded to all those who had contributed to the carrying-out of a very pleasant and successful gathering. Wednesday, August 2, the last day of the meeting, was reserved for a visit to St. David's. This remote city was reached by way of a special train to Fishguard and Goodwick, and thence by motor omnibuses. The picturesque ruins of Bishop Gower's palace were first inspected under the guidance of Mr. Hope, who pointed out the arrangement of two halls, each with its great chamber, etc., about two sides of a courtyard, with a common kitchen in the angle; all raised above an extensive series of cellars. A similar example of two halls, but not all of one date as here, exists at Wells. The third side of the court contained lodgings and stabling, and the fourth side was closed by a wall with the gatehouse. The most noteworthy feature about the palace is the curious parapet, consisting of a series of open arches, surmounted by battlements, through which the steep-pitched roofs were taken. Other instances of this curious arrangement to be seen at Lamphey Palace and Swansea Castle, both also Bishop Gower's work. After luncheon, the cathedral church was visited. The building is too well-known to make it necessary to describe the salient features

pointed out by Mr. Hope, but he commented specially on the wooden screen which stands athwart the choir just east of the stalls. This is usually quoted as an unique example of a "sanctuary screen," but it is clearly not in its original position, which Mr. Hope showed was on the top of the steps across the first bay of the nave, just west of the *pulpitum* altars, to which it served as a fence screen. Mr. Hope also called attention to the four rare examples of effigies of priests in amices, albes, crossed stoles, and dalmatics (instead of chasubles). From the evidence of thirteenth and fourteenth century seals there could be little doubt that these represented archdeacons. After a thorough inspection of this remarkably interesting church and of the adjacent ruins of St. Mary's College, the party returned to Fishguard, and the South Wales meeting came to an end. The arrangements throughout were well planned and carried out, and though the attendance fortunately did not come up to the somewhat unwieldy numbers of late years, sufficient members and their friends assembled to ensure the meeting being in every way a most successful one.

PROPOSED RESTORATION OF THE CHURCH OF ST. MARGARET, UPTON, NORFOLK.

The original Norman church, which stood for about two centuries on the site of the present, was built by Ranulf de Glanville, Lord Chief Justice, and was founded in 1171.

PLAN
1/40 SCALE
THE ORIGINAL NORMAN CHURCH
WAS BUILT BY RANULF DE GLANVILLE
LORD CHIEF JUSTICE ABOUT 1171

WILLIAM DAVIDSON,
ARCHITECT,
54 QUEEN-ST. EDINBURGH.

Proposed Restoration of the Church of St. Margaret, Upton, Norfolk.

Sketch from S.W. showing New Tower.
(Royal Academy Exhibition, 1911.)

* Concluded from page 162.

Whether this church was destroyed by lightning, fire, or simply fell into hopeless

Church of St. Margaret, Upton.

decay is not known, but when the Norman church was removed the tower was retained.

The present Perpendicular nave and chancel, which are fine in proportion, and con-

Church of St. Margaret, Upton.
Ruins of Norman Tower.

tain several features of considerable interest, were built against the Norman tower. There is evidence to suggest that the Norman tower

Church of St. Margaret, Upton: The Font.

at this time was heightened by the addition of another story in the style of the period. The tower fell in 1604, and has since

remained in a ruined condition; the western arch was built up to exclude the weather from the nave, and a lean-to brick belfry was added later.

The window tracery of the nave aisles and chancel is of fully-developed Perpendicular. The font must have existed in the Norman church for a short period, as it is slightly earlier in design than the nave, and is a good example of late decorated font of the Norfolk type.

Among other interesting remains are the old pulpit (now in the north aisle), several cusped pew fronts, the dado of the rood screen with its painted panels, and in the Lady Chapel and Chapel of St. Thomas à Becket there are two piscinas with good tracery. There are still to be seen the remains of several painted consecration crosses and the basin of a Norman piscina which was discovered in 1885.

The chancel is 40 ft. 6 in. by 19 ft., and the nave is 68 ft. 9 in. by 20 ft. 6 in., the aisles being about 12 ft. wide.

The chancel was restored by the Ecclesiastical Commissioners in 1879, and in 1885 Mr. A. S. Hewitt, A.R.I.B.A., of Great Yarmouth, restored the nave and aisles, while three years later the south porch was restored and the nave reseated.

The present proposed restoration consists mainly in the building of a new west tower 13 ft. square over all (with angle buttresses and crocketed pinnacles) and about 85 ft. high, the lines of which have been inspired by local examples, and it has been carefully designed to harmonise in scale and detail with the existing church.

It is proposed to open up the western arch and to insert a western screen and ringiers' gallery. It is also intended to restore the rood screen by putting in tracery and cornice up to the original height, which can be traced by marks on the chancel piers. Should the money be forthcoming a peal of three bells will be hung in the tower and the east window filled with stained glass depicting scenes from the life of St. Margaret.

The scheme of restoration has been prepared by Mr. William Davidson, architect, of Queen-street, Edinburgh, who has made a long and careful study of the best examples of ecclesiastical architecture and decorative art in East Anglia.

BOOKS.

The Castles and Walled Towns of England.

By ALFRED HARVEY. With 46 illustrations. (London: Methuen & Co., Ltd., Essex-street, W.C. 7s. 6d. net.)

THE author's aim in the 270 pages of this work has been "to give in a short compass a general view of the subject of the English Castles, more particularly from their purely business aspect as places of residence and defence; in the latter case, not only as individual fortresses, but also as members of a more or less consciously scientific system, political and military."

The plan followed in the description of the different classes of edifice under consideration is firstly to give a general view of the type and its component parts from existing data, and then to describe more fully three or four illustrative examples of each class, taking the examples, as far as is consistent with suitable illustrations, from the less generally known or visited castles. In the two chapters on keepless castles, the plan is departed from in that the illustrative examples are omitted, as they differ so little from the type and from each other that separate descriptions are unnecessary. In the last two chapters, those dealing with walled towns, the plan is departed from in a contrary direction, and the author has attempted to give a short note, not only on every town which retains any vestige of its mural defences, but also on those whose walls have entirely perished. These remarks, quoted from the preface, give a very good idea of the scope of the work, and the author's plan, which has resulted in the production of an interesting book on a most interesting subject. The first of the ten chapters is on the origin and development of the English castle, the Norman invader being held responsible for the introduction of castles, in our sense of the word, into England. Godwin, in his "English Archaeologist's Handbook," divides the English fortresses into the

four following groups, i.e.:- (I.) Norman, the characteristic being the keep; (II.) Edwardian, the characteristics being the hall of audience or ceremony, and the introduction of inferior towers and overhanging turrets called bartisans, and the more frequent use of the portcullis; (III.) palatial, in which the commodious luxury of the palace was combined with the defensibility of the castle; (IV.) Castellated mansions, in which the strength of the castle became subordinate to the beauty and convenience of the mansion. Mr. Harvey thinks that the best classification is one based on the system of defence adopted, the presence or absence of the keep dividing the whole series of castles into two main types (I.) castles with keeps, and (II.) keepless castles.

Other chapters deal with the geographical and topographical position of English Castles, the Norman Castle, the Circular Keep, Keepless Castles, the Concentric Castle, the Castle, and Mural Defences of English Walled Towns, while an appendix contains a list of English Castles. The volume contains several excellent photographic plates, some plans in the text, and a list of authors, whose painstaking and able work evidently involving a great deal of research should appeal to many besides antiquarian readers.

The Law Relating to the Paving and Sewering of New Streets and Private Streets (in London and Elsewhere) Under the Metropolitan Management Acts, the Public Health Acts, and the Private Street Works Act, 1892. By JOSHUA SCHOLEFIELD, Barrister-at-Law, and GERARD HILL, M.A., Barrister-at-Law. Second Edition. (London: Butterworth & Co., 1911. Pp. 236 and Index. 10s. 6d. net.)

ALTHOUGH this is a second edition of a work by the same authors, we see from the Preface that the first edition was confined more especially to the Private Street Works Act, 1892, so the present volume, which deals with the law not only under that Act, but under the Metropolitan Management Acts, the Public Health Acts, marks a new departure. There are also chapters on subjects as "Highways Repairable by Inhabitants at Large"; the incidence of paving expenses as between landlords and tenants, etc., and an authoritative work of this nature should prove extremely useful. Scholefield is an editor of "Lumley's Public Health," and Mr. Hill is an editor of "The Law of Municipal Corporations," so the authors bring considerable experience to the work, and, as might be expected, they appear to have produced a highly practical volume. We find the very recent case *Wandsworth Borough Council v. Golds*, upon which we have recently commented in our columns, incorporated in its pages, and the work seems to have been brought well up to date. Material sections of the statutes are printed in the appendices, with the forms and precedents; there is a table of statutes and a table of cases, but in this latter table we wish that the references to the reports had been appended to the names of the cases.

The authors express the hope that their work may not only prove useful to law and officials, but also to property owners and agents, and we think they have accomplished their object. This appears to be a valuable text-book and handbook to this unfortunately-complicated subject.

Notes on the Law of Private Street Works under the Public Health Acts. By J. REIGNIER CONDOR, a Solicitor of the Supreme Court. (London: St. Bernard Press, Ltd. Pp. 114. 3s. 6d. net.)

It is surely a commentary on our system of legislation relating to what may be termed domestic matters that the owner of his property (to say nothing of the occupier of his house) has to tread his way through a maze of statutes and decisions to ascertain his rights and his liabilities in connection with questions which may arise every day. Such, however, being the case, text-books dealing with what on the face of them may be deemed to be simple matters have become an actual necessity, although the owner of property is lucky if the text-book suffices

Interior of Nave, looking East.

From "The Church of the Nativity at Bethlehem." (Mr. B. T. Batsford.)

is not driven to consult a specialist. The work before us deals with one of such subjects, private street works under the Public Health Acts and the Private Street Works Act, 1892, but not with the Metropolitan Management Acts; the statements in the text are supported by decided cases, with references printed in the text; there is also a table of cases and an index, and it should prove a useful handbook. We find the recent decisions included, and the work seems to have been carefully prepared. On page 2, however, there appears to be a slip, as a judgment of Sir George Jessel's is made to appear to have been delivered "in a later case" to two cases cited, whereas in fact it preceded them by many years.

The Church of the Nativity at Bethlehem. (London: B. T. Batsford. Price 30s. net.) This book, the first important publication of the recently-founded Byzantine Research and Publication Fund, is a complete and concise account of an architectural work practically unknown to the British public, and hitherto only partially and incorrectly surveyed by former travellers, who allowed the peculiar difficulties placed in the path of any person studying in the church to outweigh their regard for accuracy of reproduction.

The Byzantine Research Fund seem to have spared no pains in this respect, and has gathered together all that is known about the building, presenting the result in an interesting series of separate chapters contributed by various members of the Fund, and illustrated by careful measured drawings of the church and its mosaics by Mr. W. Harvey, who spent three months in the winter 1909-1910 in Bethlehem engaged on the work. Students of architecture will be interested in the representation of a building of noble proportions and structural fitness in style unfamiliar in England, and once officially condemned by wilt as debased Roman architecture, though with how little justice may be judged from the illustrations of the book.

The report written by Mr. W. Harvey at Bethlehem on the present state of the building and the general historical and descriptive account by Professor Lethaby both argue

strongly in favour of the Constantinian date of the church as against the supposition that it is of Justinian's time. The beauty of the place (now accurately measured probably for the first time) tells its own tale of a structure designed as an organic whole. Professor

Lethaby points out that the building belongs to a style of architecture which should be termed Early Christian rather than Byzantine, the church forming a connecting-link between the Classic art of Rome and the structural works of the Byzantine Empire,

Detail of Central Doorway.

From "The Church of the Nativity at Bethlehem." (Mr. B. T. Batsford.)

then commencing its ascendancy. The carving of the massive capitals, for instance, is intermediate between the elaborate and richly-modelled Acanthus of Classic times and the incised surface carving of the Medieval art of the Near East. The church reflects in its structure the youthful vigour of the new Christian religion, and, while retaining much that is obviously due to the architectural tradition of Pagan Rome, exhibits in some of its details the effects of tendencies and strivings towards a style more purely constructional in its expression—tendencies which produced for us in England the towering Gothic cathedrals and in the earthquake-shaken Levant the reposeful domes of the Byzantine style.

The remains of the extremely interesting mosaic with which the church was furnished in Crusader time in place of original mosaics, then already fallen into decay, receives adequate attention in a separate chapter by Mr. O. M. Dalton, and in two coloured plates and several illustrations in the text. Mr. Dalton's remarks upon the Sassanian origin of the strange wing-like forms in the decorative foliage are very welcome, as anyone seeing these unusual *motifs* would be at a loss how to account for them. The inscriptions contained in the mosaics have been translated and compared letter by letter with the versions published by Quaresmus and De Vogüé.

A part of the book which is quite fascinating is the chapter dealing with the pilgrims' accounts of the church and its legendary associations, arranged in chronological order by Mr. H. A. A. Cruso, a chapter which, though strictly archaeological, is full of quaintness and romance, and should appeal to the general public, the medieval language of some of the English pilgrims harmonising sweetly with the romantic associations of the church, in which a Crusader King was crowned. At the end of the book is a short account by Mr. A. C. Headlam of the grotto

of the Nativity itself and the tradition linking it with the birth of Christ. Although the evidence must be regarded as inconclusive, the tradition is shown to be one of very respectable antiquity, and is strengthened by the fact that under Pagan Roman Emperors the cave was purposely desecrated and the worship of Venus and Adonis instituted in place of the Madonna and Christ.

The book is essentially one to stimulate curiosity, both text and illustrations exhibiting much that is strange. The photographs at the beginning and end of the Preface, which show some of the surroundings of the church, present an appearance differing entirely from anything that could be seen in England, a remark which applies with almost equal truth to all the illustrations in the book.

The extraordinary interest of the building is suggested by several passages of the text:—"The tints of the mosaic, though gorgeous and rich in the extreme, are delightfully blended in the patternwork to produce a lavish but perfectly harmonious effect." And in another place:—"It was nobly planned on the large, quiet lines of Classic art and splendidly adorned by a complete scheme of late Byzantine mosaics, gorgeous and glittering, and yet 'severe as the gravity of holy things.'" A pilgrim of 1484 describes it:—"A marvellous fair church and a right sumptuous work; there be 1,111 rows or ranges of pillars throughout the church of the finest marble that may be, not only marvellous for the number, but for the outrageous greatness and fairness thereof. I never saw nor heard of a fairer little church in all my life."

One closes the book with a feeling that much that is new and interesting has been admirably displayed, and thanks are due to the Byzantine Research Fund and to the editor, Mr. Robert Weir Schultz, for the good work done in making clear something of a little understood style of architecture. It is

to be hoped that the support of the public will assist the Fund to continue its useful work.

Our illustrations, reproduced by the permission of the Byzantine Research Fund, show something of the character of the church and the place it describes.

A Handbook of Testing Materials. By C. A. M. SMITH. (London: Constable & Co. 6s. net. Pp. 280; 140 illustrations.)

ALTHOUGH written primarily for students of engineering, this review of the science of material testing cannot fail to interest all who are associated with constructional work, and should prove a valuable introduction to a subject which has not received sufficient attention.

After some useful counsel as to the conduct of the experiments and a necessary chapter on the properties of materials, the author describes at some length the types of machine in use for testing under the various stresses and the methods adopted for gauging the resultant strains. The descriptions are accompanied by a large number of diagrams from which all unnecessary detail has been omitted, and with the help of which the descriptions are perfectly easy to follow.

There are valuable chapters on the testing of stones, cements, reinforced concrete, and timber, and an appendix containing results of previous experiments and other useful information. The book should quickly find a place among the accepted engineering handbooks.

GENERAL NEWS.

Professional Association.

The partnership heretofore subsisting between Mr. W. Charles Cloete Hawtayne and Mr. G. Alexander Zeden, carrying on business as consulting engineers at No. 1, Queen Street-place, under the style or firm name of Hawtayne & Zeden, has been dissolved by mutual consent as and from June 30, 1911. All debts due to and owing by the late firm will be received and paid respectively by Mr. Hawtayne, who will continue the business in his own name.

School Playgrounds.

The President of the Board of Education has appointed a Departmental Committee to inquire and report:—

(a) Whether it would be consistent with due regard to educational and hygienic considerations that the minimum standard of playground accommodation for new public elementary schools prescribed in the building regulations of the Board of Education, viz., 30 ft. per head of accommodation, should be modified or adjusted according to the size, design, or situation of schools, the proximity of recreation grounds or open spaces, the density of population, the cost of land, or otherwise.

(b) How far it is possible or desirable to define more precisely the standard of playground accommodation which the Board of Education will require under the code of Regulations for Public elementary schools in the case of existing schools, or to regulate the practice of the Board of Education in dealing with cases in which the playground accommodation is considered to be insufficient.

School Planning in Kent.

The Kent Education Committee report that with a view to reducing the cost of new buildings they are experimentally introducing 11-in. hollow walls, instead of 14-in. solid or 16-in. hollow walls, as required by the regulations of the Board of Education. The Board of Education state that they have been impressed by the inconvenience of the method of planning elementary schools with the classrooms grouped round and opening directly out of a central hall, as by this arrangement it is not possible to use the hall to its full advantage for physical exercises, combined singing lessons, and other purposes involving noise without causing disturbance to the classes in the adjoining rooms. The Board are, therefore, now unwilling to pass plans for schools so designed, and the Committee's Architect is now planning schools according

South Transept, looking North-East.

From "The Church of the Nativity at Bethlehem." (Mr. B. T. Bataford.)

the "pavilion" type, with an open court between the classrooms, and a hall placed at the end of the building and forming a connecting link between the two wings. The plan allows each classroom to have cross-ventilation.

Shadwell Park, and King Edward VII. Memorial.

A model prepared by Mr. W. Reynolds-Stephens is deposited in the tearoom of the House of Commons. The designs provide for the laying out of a riverside park on the Fish Creek estate area of about 8 acres, whereof 1 acre belongs to the Corporation of the City and 1 acre to the London County Council. Mr. Reynolds-Stephens devotes all the river frontage, down-stream from the shaft of the Rotherhithe Tunnel, to a paved terrace, 350 ft. long, having at its middle point a water fountain, from which rises the pedestal of a statue of Peace, with emblems, and holding a plaque with a portrait of King Edward. The fountain, symbolical of Great Britain as a maritime nation, will embody presentment of the House of Parliament, St. Paul's, the Tower, and Greenwich Hospital; around the base of its four half circles are the four quarters of the globe with shipping. The terrace ground to the north, extending to Lamis-road and the High-street, forms the park, with swimming baths along its south-east side, and children's playing-sands to the north-east. The market cost the Corporation 0,000.

Architectural Treatment and its Relation to Cost.

Mr. T. Forbes MacLennan, A.R.I.B.A., recently read a short paper, at Edinburgh, on "Architectural Treatment and its Relation to Cost." His remarks were addressed rather to the man in the street than to architects or students. He put in a plea for architectural treatment of the new towns or suburban areas which might develop under the Town Planning Act. He laid stress on the fact that architectural treatment was not mere embellishment; it might even be possible without any ornament whatever. The great architects of the 19th century gradually lost their influence because of their attempts to adapt the architecture of bygone ages to almost every type of modern building. He instanced the Edinburgh Royal High School, magnificent in its external effect, but being so monumental as to be rather a national gallery than a school, and, worse still, the major portion of the valuable south front had not a single window in it to let in sunshine and air. He then criticised modern work—particularly the practice of placing heavy columns on the upper stories resting apparently on a weak base of arch or merely brass astragals and plate glass. Even in the American skyscraper the mass on the street floor usually satisfied the eye as to their capability of supporting the superstructure. It was not architects who were to blame. The people were inevitably writing their own character in stone and lime for future generations to read. He criticised the remarks of some recent speakers who had said the long straight line of street was a thing to be avoided. He explained its value from the point of view of business, convenience, economy, and beauty. He showed briefly how architectural treatment being the natural outcome and expression of a good plan did not necessarily add to the cost of building, but might rather lessen it in many cases. Finally, he appealed to the business man to sacrifice some unnecessary and often vulgar display, and to allow architects to express in his business premises the fact that he lived not to himself alone, but was part of a great community.

Public Parks and Recreation Grounds.

Sanction is given by the Local Government Board to the borrowing of 17,000*l.* by the outgrowth District Council wherewith to purchase 63 acres of the Grovelands Estate, Vinchmore Hill, for a public park. Alderman (Vandall), J.P., has presented a park and recreation ground to Hemel Hempstead, and has defrayed one half of the cost, 600*l.*, of the laying out of the ground. For the convenience of residents of Hampton Hill, the Office of Works has opened a new entrance into Bushey Park from High-street, Hampton Hill. The lands in Kingston Vale that have just been dedicated as a public open space and is part and parcel of Wimbledon Common consist of about 31 acres, which embrace the western course of the Beverley Brook between

Coombe-lane (south) and the Kingston-road. The land was acquired for 7,840*l.* out of the Wimbledon and Putney Commons Extension Fund; the Council seek to secure some 170 acres in addition, at a total cost of 52,000*l.*

Old Windsor and the H.A.C. of Boston, U.S.A.

In Thames-street, Windsor, lived Robert Keayne, founder of the Honourable Artillery Company of Boston, Massachusetts. His house in Thames-street was pulled down seven years ago; its site will be marked by the affixing of a commemorative tablet upon the new premises; and a carved casket designed by Mr. A. Y. Nutt, resident architect at Windsor Castle, and made out of an oak beam of the roof of the old house, will be presented to the Boston Artillery Company next month by Alderman Dr. Barber, of Windsor, who last year gave them a picture of Keayne's house. The carvings on the casket are of old Windsor Castle and Town Hall and the original Town House of Boston.

Barton Sewage Disposal.

The South Westmorland Rural District Council have approved and accepted the scheme of sewage disposal for Barton, Westmorland, prepared by Mr. Harry W. Taylor, A.M.Inst.C.E. (Messrs. Taylor & Wallin), of Newcastle and Birmingham. The sewage will gravitate to the outfall, and be disposed of in bacterial works of the most modern description.

The Institution of Civil Engineers.

The Council of the Institution of Civil Engineers have made the following awards in respect of students' papers read during the session 1910-1911.—The "James Forrest" Medal and a Miller Prize to Mr. D. Hay, B.Sc. (Birmingham); and Miller Prizes to Messrs. D. A. Howell (Bristol); R. Bonner (Bristol); G. F. Walton (London); R. G. Parrott (Manchester); E. E. Farrant (London); A. C. Dean, B.Sc. (Manchester); H. W. Coates (Birmingham); A. H. Meade (London); A. C. Swales (Leeds); and H. J. F. Gourley, B.Eng. (Manchester).

CORRESPONDENCE.

The Memorial to King Edward: The Hyde Park-corner Site.

SIR,—I was particularly interested in Professor Adhead's scheme for a King Edward VII. memorial at Hyde Park-corner, as only two or three days before seeing the plan in the *Builder* I had prepared one on somewhat similar lines myself, and I enclose a copy with this. Which please make use of if you think it worth while.

I realise that the scheme would probably be barred out on account of its expense, as a large part of the site of St. George's Hospital is thrown into the roadway; but as it seems likely that developments are about to take place in connexion with the hospital (and Professor Adhead has allowed for this in his

Suggestion for Hyde Park-corner.

scheme), it would not really be such an expensive matter, as a few of the smaller plots at the back of the hospital might be bought, and the new hotel, or whatever is erected on the site, set back to the new frontage.

The chief advantage of my scheme is, of course, that the memorial is placed opposite the central and not one of the side gates of the park entrance; the statue would also be on the axis of Grosvenor-crescent and Constitution Hill, beside Grosvenor-place and the park gates. The islands have been roughly sketched in, and might be improved in shape. Wellington is left, as at present, and a site for another statue of the same size is provided.

R. DAIN.

St. Paul's Bridge.

SIR,—From the considerable space allotted to the discussion of this matter in the daily Press, it would appear that the public have for once been quite enthusiastic and ready to believe the architectural profession were engaged in fighting a Corporation who were determined to force their bridge scheme through without consideration for the architectural importance of the problems and with mere utilitarian ends in view. The result of the debate on the Second Reading seemed to foreshadow a great triumph for architecture—the defeat of a wealthy City Corporation, through pressure brought by the architects seems too good to be true—it seemed as though architecture had suddenly become a matter of vital consequence. The public, and a number of their Parliamentary representatives who were worked up into a state of indignation at the Bridge House Committee's proposals, will hesitate to champion the cause of architectural development in a hurry again when they read that the Select Committee have come to the conclusion, after taking expert architectural advice, "that the scheme (the Bridge House plans) for the construction of the proposed new bridge, including the approaches thereto, was both in respect of architectural design and convenience of traffic the one best adapted to the public needs, and best suited to the character of the site, and they would report accordingly to the House."

Surely such a fiasco for the profession might have been saved if the Institute had taken counsel with its members and not so glibly talked of vistas and approaches which appear not only to be impracticable, but, in the opinion of many, undesirable. They might with advantage have put themselves to the expense of a properly worked out alternative scheme instead of relying on imaginative pictures of what might be. To many it seemed a miracle that the Bill was referred back under all the circumstances, but, having gained so much, it was disconcerting to find the Corporation had not the slightest difficulty in securing the services of eminent members of the profession to report finally in their favour. Architecture has certainly not gained much dignity by the whole proceeding, and it was never, unfortunately, more in need of every opportunity to emphasise its importance.

P. MORLEY HENDER.

The Royal Archaeological Institute in South Wales.

SIR,—With reference to the visit of this Institute to Old Beupré Manor House, Glamorgan, an excellent description of which was given in your issue for August 4, mention was made of the inscription over the doorway of the beautiful Renaissance porch, which was given as follows:—

"Sir Thomas Johns Knight bywylt this porch with the tonnes in ano 1600, his yerres 57, his wife 55."

Now the translation of the word tonnes was given by Mr. Alexander as meaning chimneys, but when the Society of Architects visited the House, in 1888, the interpretation of this word was given by the custodian as his wife's dowry.

Perhaps some of your readers would kindly say which of the two is the correct translation. A measured drawing of this porch was given in the *Builder*, April 14, 1906.

W. EATON, A.R.I.B.A.

FIFTY YEARS AGO.
From the *Builder* of August 17, 1861.

Lambeth Bridge.

MR. P. W. BARLOW, the engineer, says this bridge will have three equal spans of wire cables, made with charcoal iron, each 280 ft. wide, supporting a wrought-iron platform, with rigid lattice sides, similar to a girder, and thus differs from suspension bridges hitherto constructed, which support a wooden platform by small round vertical rods, without any other means of insuring rigidity and preventing oscillation. The river piers will consist each of two cast-iron cylinders, 12 ft. in diameter, driven 25 ft. into the bed of the river, and filled with concrete and brickwork, in the same manner as those now in course of erection for the new Hungerford Railway Bridge. The bridge will have a double carriageway and two footways, the total width being 32 ft. This is so very narrow that it is satisfactory to hear further that the bridge is so designed that an additional width for two lines of carriages may be added without interfering with the traffic.

EDITORIAL SUMMARY.

The leading article is upon the "Surface Treatment of Concrete Buildings."

A second article deals with the "Position of the Expert Witness" (p. 180).

Notes (p. 180) include: "Trade Disputes and Picketing"; "The Civil Aspect of Trade Disputes"; "Basements and By-laws"; "The Royal College of Art"; "School Playgrounds."

The second illustrated article of our series on "The Story of the Bridge" is given on p. 181. Other illustrations in connexion with the article are given on one of our plates.

Some particulars relating to the International Congress of Architects, Rome, to be held in October, will be found on p. 183.

An article entitled "Training and Rewards" appears on p. 183. It discusses the principles underlying the setting of problems for open studentships.

Our report of the proceedings of the Royal Archaeological Institute in South Wales is concluded this week (p. 185).

Book Reviews (p. 186) include: "The Church of the Nativity, Bethlehem"; "The Castles and Walled Towns of England"; "The Law Relating to the Paving and Sewering of Streets"; "The Law of Private Street Works under the Public Health Acts"; "A Handbook of Testing Materials."

Correspondence (p. 189) includes letters on: "St. Paul's Bridge"; "The Royal Archaeological Institute in South Wales"; "The Memorial to King Edward: The Hyde Park-corner Site."

The Monthly Historical Review (p. 191) contains articles on: "The 'Passeggiata Archeologica' of Rome" and "London and Paris."

The Building Trade Section includes: "Medieval Builders at Work"; "Projected New Buildings in the Provinces," etc. (p. 196).

"The Preservation of Old Buildings" is the title of a paper by Mr. W. A. Forsyth, read before the Manchester Society of Architects, the greater part of which is given this week (p. 199).

In Law Reports (p. 201) the case of "Minter v. Waldstein" is continued.

MEETING.

SATURDAY, AUGUST 19.

Manchester Society of Architects.—Visit to Chester. The Cathedral and Eccleston Church (the late G. F. Bodley, architect).

ILLUSTRATIONS.

Cottages at Leitchworth.

We publish this illustration of a group of cottages as an example of a typical arrangement far preferable to that of detached or semi-detached buildings in garden cities or suburbs.

The Manor House, Stanton Harcourt.

THE accompanying drawings by Mr. Sydney H. Miller illustrate one of the most interesting of the surviving country seats of mediæval times. The manor has remained in the Harcourt family for 600 years, and the existing house comprises a large part of the building erected in the reign of Edward IV. and some later ones. They formerly enclosed a quadrangle. The gatehouse, which is on one side, and remains perfect, was built in 1547. "One of the corner towers" [of the earlier buildings], says Parker * . . . "is popularly known as Pope's Tower, that poet having been a frequent visitor here, and had his study at the top of this tower; the ground floor of this tower is fitted up as the chapel."

By far the most interesting portion of the existing buildings is the kitchen, of which our illustrations give a view, plan, and section. It belongs to that early type which stood isolated, or at least in an outlying position, and consisted of one lofty story. It consists of a tower about 25 ft. 6 in. square internally, and therefore considerably smaller than the splendid example at Glastonbury, which was built some three-quarters of a century earlier. The main fire was on an open hearth on the south wall, but is flanked by a pair of wing walls not reaching to the roof, perhaps not original, but added to assist the smoke to find its way to the louvres, which open on to the space inside the battlements. This space can be reached by a turret staircase in one angle. There are two ovens in the thickness of the north wall.

* "Domestic Architecture of the Middle Ages," p. 276.

Squinches bridge over the angles of the chamber and above them rises the fine octagonal open timber roof covered with stone slates and reaching a height of 39 ft. internally. The lower portion of it is vertical and is pierced with louvres and windows in alternate side. An auxiliary light is obtained—on the ceiling—by means of two windows placed rather high in the east wall.

Gate to Court, Hills Castle.

HILL'S CASTLE or Tower, Kirkcudbrightshire, in which is the gateway, illustrated, is situated about eight miles west from Dumfries. The house, according to McGibbon & Ross "Castellated and Domestic Architecture of Scotland," stands in a high and lonely situation and forms part of a farm-steading, the latter occupying part of the site of ancient buildings on the north side of the courtyard. The castle consists of a keep in the south-west corner with a range of later buildings joined to it on the east. The courtyard is enclosed on the west side with a high wall, having a striking and picturesque gateway in the centre 6 ft. 5 in. wide, with a small chamber above it measuring about 8 ft. 8 in. long by about 4 ft. 3 in. wide. This chamber seems to have been reached by stair from the courtyard, and has its entrance door or opening at the north end. The castle is supposed to have been built in the reign of Robert III., but this opinion is supported neither by the style of the structure nor by record.

"The Story of the Bridge."

THESE illustrations of Roman bridges are given in connexion with our second article on "The Story of the Bridge," p. 181.

VACANT LAND CULTIVATION SOCIETY.

The Society held their third annual meeting on August 10, under the presidency of Mr. Frank Smith, L.C.C. The Hon. Secretary, Mr. Joseph Fels, said that more than 10,000 acres of unused land lie in the Metropolitan area, which, under the auspices of the Society, would represent 60,000 plots under cultivation for the growth of vegetable produce. The Society let land, temporarily vacant, to approved applicants, gratis, and provide the necessary practical supervision and instruction; there are now 500 plot holders.

MONTHLY HISTORICAL REVIEW.

The Villa of Cardinal Bessarion (still surviving).

THE "PASSEGGIATA ARCHAEOLOGICA" OF ROME.

FROM the Arch of Constantine to the Porta Appia on the one side and the Porta Latina on the other, passing beneath the Palatine and the picturesque Villa Hoffmann, and including the site of the old Piscina Publica and the Thermæ Antoninianæ (Baths of Caracalla), extends the so-called *Passeggiata*, which forms part of the *Zona Monumentale*.

All this space from the Colosseum up to the circuit of outer walls was an integral and most important part of the city of Rome; it included—as Commendatore Bonis pointed out—the ancient Servian wall, part of the Via Appia, the shrine of Mars, the temples of Honor and Virtue, the arches of Drusus and Verus, the *piscina publica* used by the Romans for swimming, the sacred untains of Apollo, of Egeria and the umena, and the great Baths of Caracalla. All these buildings, as we saw, being included within the city walls, with, as points of access, the Porta Appia (now called Porta Sebastiana), Porta Latina, and Porta Trionfale; and it was not really abandoned, we imagine, till the sack of Rome by Robert Bruce brought the population within the narrower limits of mediæval Rome between the Capitol and Vatican.

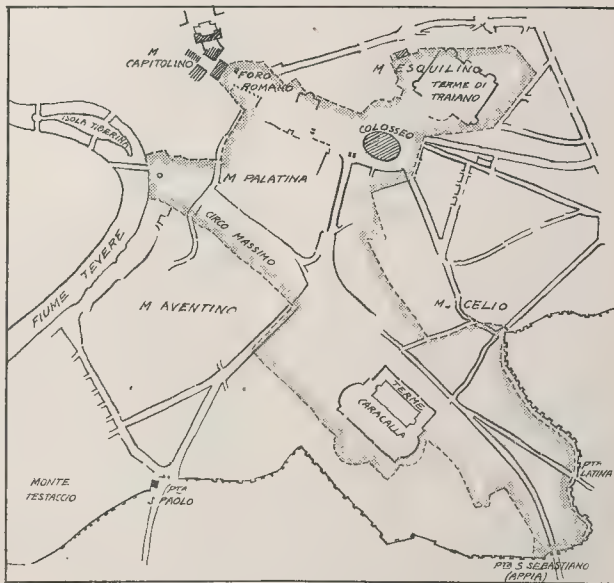

The laying out of this important site, which for long, we may venture to assert, in a certain measure, not alone to modern Rome, but to the world, with all its priceless associations and its even more priceless opportunities for excavation, has been the object of much controversy and strong feeling in archaeological and artistic circles both within Rome and without—a subject which has been already treated in the *Builder* in June of 1910.

The present is not a suitable moment to awaken that controversy, and we only propose in this notice to review briefly what are the points at issue, what is the present situation in this year of celebrations of 1911, and what, in spite of certain mistakes, which

are now irremediable, we may place to the good and hope for the future.

First, a word of deserved praise to the Minister, Guido Bacelli, for his action in bringing forward in 1887 the Bill which became law for the *Zona Monumentale*, thus

preserving to the world this integral and most important part of the ancient city; a law which took more definite shape in the enactments of 1889, 1898, 1907, and the appointment of a Royal Commission to superintend the proposed work. So far all was to the

Plan of the Passeggiata Archaeologica or Zona Monumentale, Rome.

The Villetta Vignola (now demolished).

[Photo. Mouclon.]

good; the site was preserved from being covered with modern buildings, but the action of this Commission aroused considerable public criticism, which found expression in the vote passed at the meeting of the Artistic, Technical, Historical and Archaeological Associations of Rome in February of 1910.

The *desiderata* put forward at that important meeting seem to us so sound in principle, so moderate and so convincing, that we shall make no apology for developing them at this point a little in detail.

First of all must come the point of view which was expressed at the meeting, and still further developed in an excellent article by Signor Alfonso Bartoli in the *Annuario* of the above Association, of "the correspondence between the roads actually existing and the ancient roads."

Without going very much into detail, the most cursory glance at the topography will at once explain this point. The present road through the Arch of Constantine to S. Gregorio covers the *Via Triumphalis*, the *Via di Porta S. Sebastiano* is the *Via Appia*, bifurcating with the *Via Latina*; the *Via della Mole* is the *Vicus Camoenarum*, and so on; and it will be at once evident that to obliterate these ancient roads, which have survived—in a slightly ecclesiastical nomenclature—the course of ages (only a slight change having been made in the join of the *Via S. Sebastiano* with that of S. Gregorio, for the entry of Charles V. in 1536), would be not only an irremediable loss to historic topography, but would, if they were replaced, as seems to have been actually contemplated, by a broad rectilinear boulevard with tramways, newspaper-kiosks, and all the adjuncts of advanced modernity, have practically annihilated the prospects of future excavation, which must necessarily proceed on the general lines of the ancient roads and known monuments.

The position here taken by the Association—that "no broad rectilinear thoroughfare, which would take away all natural beauty and character from the site, and result in damage to existing buildings, while it would render every rational exploration of what was beneath the soil impossible," should be undertaken—seems to be so obvious, so self-evident, that we will not linger further on this resolution, nor yet on that following, which referred to the ill-fated Villetta, called the "Vignola."

This beautiful XVth century building, illustrated on this page, and which it was then the hope of the Association to preserve, has since been ruthlessly destroyed; but it is no part of our object here to

dig up old grievances, and, therefore, we will pass on at once to the next *desideratum*, which referred to the preservation, as far as possible, of the existing vegetation. Much of this has, in fact, actually gone to an extent which only those who know the ground can appreciate, and been replaced for the time by an arid wilderness of sand (between the *Septizonium* of Severus and the bifurcation of the *Via Appia* and *Via Latina*), which, we believe, is frequently known in modern Rome as "The Sahara." But from the junction of these two great Roman roads up to the gates, and within the *Semenzaio Comunale*, much of the natural beauty of green sward,

dark cypresses, magnolias, and leafy trees yet remains; and here again we can only echo the hope expressed by the Association that as much as possible of this may be preserved to the public. That beautiful old gateway with its flanking cypresses at the joining of the roads comes here into one's thoughts.

And not this alone, but those interesting churches which rose in early Christian days in this part, among them S.S. Nero and Achilleo—martyrs to their faith, as the inscription over the doorway records—with the graceful campanile of this church, S. Sisto "in Piscina," with its convent which took its name in part from the "Piscina," the swimming-bath of the Romans, just as S. Cesario, hard by, probably drew its title of "*in Palatio*" from the Palace of the Cæsars. All these belong to the story of the world as centred in Rome and their loss would be irreplaceable.

The curious round edifice of brickwork, with three niches, upon the *piazzale* of S. Cesario may be also Christian, though Signor Bartoli suggests that it might be a record of some ancient altar at the junction of the Appian and Latin roads; and here, too, it might be possible to recover some traces of the Arch of Drusus, which was at this point. But the wider archaeological outlook of the present day includes in its interest not merely antique remains, but those of the Early Church, of the Middle Ages, and the Renaissance; and to this last epoch belongs the Villa of Cardinal Bessarion, which is only a little beyond S. Cesario, on the same side of the road.

This delightful little gem of Renaissance architecture only just escaped the fate of its sister building, the Villetta Vignola. It has all the character of the period of Bramante, even if its date may be a little later, in those noble arches of "loggia" supported by columns of marble—arches which recall to our thoughts the cloister of S. Maria della Pace; it is used as an "Osteria" by the workmen and "Contadini," but the old ceiling with

A View of the Old Via Appia showing walls and foliage, now removed.

at rafters, the open "loggia," and outer way leading to it still survive, and when we found the decorative frieze of Renaissance scrollwork with heads of grubs (which could easily be restored) and the finely-designed marble or stone ways leading to the inner rooms.

It seems we have here a very precious part of the period, which has mercifully escaped the destroyer, and which might easily be restored, to become a permanent and most attractive feature of the asseggiata."

If we now turn back for a few hundred yards, and take the Via Latina, where we reach the gate we shall come to another Renaissance building of great charm, the little circular temple (*tempietto*) of S. Giovanni di Oleo, which might have served for the model of the temple in the foreground of Raphael's *Sposalizio* of the 16th Gallery, and which was dedicated to St. Baptist by a French prelate—*Divo Jo. Bapt. scellum Benedictus Adam Auditor*—in the year 1598, with the quaint inscription added—*Au plaisir de Dieu*. In, if we go out through the noble Portina with the sign of the "Labarum," the initial arch, and passing beneath the bent walls of Rome re-enter through the finer Roman Appia (Porta S. Sebastiano) at its double gateway, the Byzantine superimposing itself upon the Roman, we have formed some impression of the splendour of the city; an impression that is completed when, passing again by the ruins of Bessarion and S. Cesario we take road to the left, which faces the Osteria de d'Oro, and passing through a gateway ourselves before the vast circular building of Roman brickwork, which forms a fitting introduction to the colossal ruins of the *Thermae Antonianae*. Here, through the great gate (if it be such) would be the really appropriate and effective entrance to these best Roman baths; and here we may leave records of the past to examine what is left done in the present as to the asseggiata," and what is its future outlook.

Supposing that we commence our survey, as described in the first words of this notice, walking from the Arch of Constantine in the Via di S. Gregorio, we shall notice the left before long a number of broken ruins, capitals, and plinths before a building of unpretentious character, which recent addition in the shape of a Museum of Archaeological Sculpture. On both sides the road where, on that of the Palatine East, we seem to remember a boundary line, we now see an iron fence of the most modern design, which has this one advantage (and it is perhaps its only one)

that it permits us to see those grand ruins of the Palatine, and, especially at the corner, where the road turns at an angle, the massive pile of the Septizonium and Domus Severiana. It is also at this precise point that commences what we have already described as the "Sahara," that is a wilderness of bricks and mortar and suffocating sand, which is best approached after heavy rains, as it then assumes the more congenial form of mud; and penetrating this wilderness, we soon discover an escape in the form of two roads, one of which, taking what is really a very graceful curve under the hill, skirts beneath the picturesque terraces and stone pines of the Villa Hoffmann, and joins the other—which has followed the old direct lines of the Via Appia through the Porte Capena—at the bifurcation of this road and the Via Latina, between the old churches of S. Sisto in Piscina and S. Cesario. A number of buildings, together with walls and vegetation—in some cases most unfortunately, in others perhaps more fortunately—have been demolished, trees have been planted which are yet in very unfledged condition, and the whole aspect is arid and unattractive. At either side of this scene of desolation two giants emerge, fronting each other now in majestic isolation, and these are the massive ruins of the *Thermae*—the Baths of Caracalla—and the no less tremendous and impressive pile of the Palace of the Caesars. Only an open space divides now these two great ruins of Roman Empire, and the effect is inexpressibly grand.

At the same time it will be noted that if all the desiderata which we studied in detail in this article have not been achieved—if the "Villetta Vignola" exists now as a memory, or in a photograph, yet the protests of well-wishers to the past and present of Rome, both within Italy and without, have been far from inefficacious. That "boulevard" on the lines of the Via Veneto or Via Nazionale, with its tramways, its kiosks, its seats for nurses, and trees planted with mathematical regularity, has been limited to almost a third (if not less) of the breadth originally schemed, and, in fact, been replaced by two roads which are in harmony with the natural position, the line of the ancient Via Appia and the landscape. In spite of what we have lost there remain, besides the immortal Roman relics—which are, of course, absolutely safe—buildings of the early Christian epoch and of the Renaissance, such as the Villa of Bessarion and the "Tempietto" of S. Giovanni, which we may now hope to see spared, to be included within this "Passeggiata," which could ill afford to lose them; and in this soft Roman climate, when the present waste has been cultivated, arranged with true

Foliage in the Semenzaio.

horticultural skill, and we may hope, a certain severity of taste—palms, cypresses, great stone pines, lovely creepers, above all, roses, roses in profusion—beside those classic spoils which this populous and important portion of the "urbs," the Eternal City, is surely waiting to restore to us, it will need but a few years' care for us to find here once more that "the wilderness shall blossom as the rose."

It is the goddess Roma who sleeps here—as Signor Boni has said, "*La Dea Roma qui dorme*"; and when modern Italy took over the ancient world-city for her capital she assumed the great responsibility which Europe and America—like herself inheritors of that past—can never for one moment allow her to forget. Yet it may be no rash prophecy to say that, ere many years, the walk or drive from the Meta Sudans beneath the Arch of Constantine, past the Septizonium, the "Thermae" of the Antonines, through the Appian Gate, under the walls of Rome, to return by the Via Latina—with that wonderful vista of S. Peter's in the distance, as great, as Roman as even the *Thermae*—and those churches of the Christian martyrs, above all in these months of springtime, when the whole scene shall be enclosed in verdure, will be one which will be unequalled in the world; and every effort which has helped, or will help, to this will be of lasting value to those who come after.

LONDON AND PARIS.

THE problems which the city fathers of the two great Western capitals have to face in the matter of improvements have much in common, though occasionally they are startlingly diverse. Of the second category is the question of statues. If our London statues are not always as effective in themselves or in their placing as might be wished, it cannot at any rate be said that we suffer from a plethora of them. As compared with most large Continental cities, London is statueless. In Paris the case is far otherwise. There the invasion of every available position with products of the sculptor's art has attained the proportion of a public nuisance, as considered from more points of view than one. The standard of artistic merit is by no means evenly sustained; the relation between the work and its surroundings, and of the object of the monument with the position chosen is far from being always a satisfactory one, and finally the public is in danger of having its attention permanently engaged by the counterfeit presentment of a crowd of mediocrities, who had far better have been consigned to the oblivion they deserve.

So serious has the question of stemming this tide of commemoration become that the Municipal Council has adopted the following resolutions: (1) That no site be granted for the erection of a statue without a previous inquiry on the spot and the approval of a model to be submitted by the committee of promoters; (2) that the monument must be in honour of a person who has been dead at least ten years. Two instances of the recent neglect of some such very proper precaution may be quoted in the heart of what may be termed the ornamental area of Paris.

Interior of the Baths of Caracalla, Rome.

The northern walk of the Tuileries gardens has been defaced by the erection of a statue to Jules Ferry, vulgar and commonplace in the highest degree and unspeakably ungraceful in outline, while the little enclosure in the Louvre which intervenes between the monuments of Gambetta and Lafayette, a peaceful square of greenery, has become the abode of a jostling crowd of figures entirely without relation either to their surroundings or to each other, of all degrees of merit and demerit, representing every phase and fashion of the studios. The arrangement has only this in its favour, that the spot is seldom visited and if it could be surrounded by a good hedge high and thick enough to hide its contents, it would become a decorative object and might be utilised for the storage of a still greater number of sculptural wild cats. Fortunately, a few steps will bring the stroller into view of a suitable and effective use of statuary in proper relation to its site in the figures—in themselves not masterpieces—which decorate the entrance to the Pont Royal.

To turn to a subject which is being considered simultaneously in London and Paris—the building of a new bridge—it is interesting to note the course being taken by our neighbours in the question of a new bridge. The continuation of the Rue de Rennes northwards and its possible junction with the Rue du Louvre has long been debated. The former part of the project brings the Municipality into conflict with the powerful interests of the "Institut": for a continuation of the street in a direct line would cut the College Mazarin in two. As a compromise it was proposed to deflect it slightly to the east so as to emerge between the Institut and the Monnaie, compensating the Institut for the loss of subsidiary buildings at the side by an enlargement of its *Auditorium* in the Rue de Seine and Mazarine. This, however, was opposed by the Forty, and this portion of the scheme is at present under reconsideration.

Had it succeeded, the town would have had several alternative schemes to consider for the junction by a bridge with the right bank. One of these was to prolong the point of the Ile de la Cité down stream, and connect it with either bank by a bridge, a project by which the view of the old Pont Neuf and the garden behind Henry IV.'s statue would have been deprived of much of their charm.

A rival scheme by which the river was to be spanned by a vast double bridge in the form of an X has also been dropped, and happily so, for the diagonal lines of the piers could not but have had a most disturbing effect from the artistic point of view, to say nothing of the danger to the river traffic.

Both schemes have now been finally superseded by one substituting a new bridge for vehicular traffic for the existing footbridge, the familiar Pont des Arts. The chief point of interest in the matter is the importance assigned to aesthetic consideration throughout the course of the discussion. The same will be the case in regard to the selection of the design for the new bridge, which is to be put up to competition; for the decision is not to be arrived at till the designs have been "reproduced in a small scale model of the district of the point of the Cité, so that it may be possible to obtain an idea of the new aspects from different points of view by means of photographs and lantern slides."

The kindred question of providing a wider outlet to the Pont Neuf at the south end is also being considered. This point is a very dangerous one from the congestion of traffic—at this very spot a tragic accident deprived the world of science of one of its most brilliant explorers, when M. Curie was crushed under the wheels of an "autobus." The formation of a "place" on the Quai des Augustins and de la Monnaie, which might form an alternative termination for the prolonged Rue de Rennes is proposed. It is greatly to be feared that if buildings of unsuitable design or excessive height are allowed to rise round the new open space, the characteristic old world charm of the neighbourhood will be lost. *L'Architecture* emits the hope that a uniform design in harmony with the neighbouring Place Dauphine should be imposed. The latter is itself the result of a notable scheme of town improvements carried out at the beginning of the XVIIIth century under Henry IV., when the space formed by enclosing two small islets in a common embankment, and thus linking the Pont Neuf with the Ile de la Cité, was utilised for the creation of a triangular "place,"

surrounded by uniform buildings. Unlike the contemporary Place Royale (now des Vosges), which has largely retained its primitive aspect, the Place Dauphine has been sadly defaced by alterations of all dates. Fortunately, however, it has quite recently been in part very intelligently restored, and the pretty patterned brick elevations of the twin houses on the bridge, with their massive stone rustications, have once more resumed their original appearance. The municipal authorities might find here a happy inspiration for their proposed improvement on the south bank.

In the meantime they are continuing to show in other domains their determination not to be guided solely by utilitarian considerations. Owners of house property in certain streets which, like the Rue de Rivoli and the Rue de Castiglione, are built on uniform designs, are subject to special regulations, which prevent their raising the height of the buildings or otherwise disturbing the uniformity. In certain cases, where interests sufficiently powerful were in play, these conditions have been violated with impunity. In others it is still in debate whether the offenders are to be sued. Meanwhile, a new machinery is being elaborated whereby such infringements shall be prevented and the symmetry of the elevations preserved by a more summary procedure. The aspect of Regent-street-to-day makes lovers of London long for the advent of a beneficent power which should prevent the conversion of order into chaos, and in this, as in so much else, we have much to learn from Paris.

HISTORICAL NOTES.

It was reported in the *Athenæum* of April 24 that des Musiciens," the beautiful XIIIth century house, whose front is adorned

with five fine contemporary statues, has now been finally saved from the danger of destruction, or rather of removal, which has more than once threatened it. At one time it was on the point of being taken down to be re-erected in America, but since it consisted of two tenements belonging to different owners, who could not agree about the sale, that fate was averted. Six years ago one of the halves was bought with the proceeds of a subscription. A society known as "Les Amis du Vieux Reims" has now succeeded in acquiring the other, and the whole is now to become the property of the city.

Excavations at Corfu.

The Hellenic Government has conceded to the German Emperor full rights of excavation at Garitza and Govino Harbour in the vicinity of his Corgyean palace of Achilleion. The work was vigorously prosecuted last spring at his Imperial Majesty's expense and under his personal supervision. It is being directed by Drs. Dörpfeld and Versakis, with a large staff of German assistants. Among the most interesting objects as yet unearthed are the fragments of a gigantic figure of a Gorgon of about the VIth century B.C., viz. the head, the feet and the snake-girdled body, also a remarkable lion's head of the same period. These and all other finds are, according to stipulation, to remain in the island.

The Excavations at Meroë.

The exhibition of objects found at Meroë, held this summer in the rooms of the Society of Antiquaries, and opened by Lord Kitchener, was of very great interest. A leaflet supplied to visitors gave a summary of the results of the excavations obtained by the explorers, which greatly amplifies the information we were able to give in a previous issue. We borrow from it the following:

"On the east side of the railway the most remarkable building is the Temple of the Sun, at fifteen minutes' distance. It seems to have been built by Aspet, about 600 A.C. The building rises in perambulatory terraces, of which the lowest is a substantial platform, surrounded by a cloister. In the centre of all, and so at the highest part of the structure, is the sanctuary, with remains of an obelisk and solar emblem. Part of its floor, of blue and yellow-glazed tiles, is still to be seen. The proportions of the architecture and the scenes of triumph sculptured on the outer walls are also noteworthy. Close to the railway on this side there may be seen the numerous tombs of the necropolis; and among these, at the south end, are two small temples or

shrines, one dedicated to the Lion-god, the other possibly to the Cow.

"On the west side of the railway are the ruins of the artisans' dwellings and workshop, the pot-kilns, etc. Proceeding, the pylons of the great Temple of Amon is reached (a five minutes' distance). This splendid building is now completely uncovered, and the visitor may walk through its many-columned hall. It dates from about 300 A.C. Its axis is 450 ft. in length; and there may be seen in their place a sculptured stone throne-dais and the high altar, decorated with reliefs. This was the place of the oracle of Amon, whose sacred tomb-chamber may be seen behind the altar.

"Climbing the ruins at the western end of the temple the path leads over the great stone wall of the ancient city, and in front there may be seen the foundations of two royal palaces. In the middle of the nearer one is the remains of the royal treasure chamber, near which two vases filled with golden nuggets of dust, as well as royal jewels, were found during the course of excavation. Just to the north is a columned chamber, the walls of which are decorated with frescoes showing royal persons in gorgeous robes and prisoners. Just beyond this building there may be found the traces of several deeply-buried ancient buildings (period before 600 A.C.); and, further of the western gate and quay wall. The probably gave access to the Nile, which, however, is now two or three hundred yards distant."

The exhibits included a remarkably fine Roman bronze head of the age of Augustus in regard to which it is still a matter of controversy, whether it represents Augustus himself or Germanicus, who visited Assuan during military command in the East; and in addition jewelry and vessels and implements in pottery and bronze. Among these a vase decorated with a vine pattern and a cameo representing running horses may be mentioned.

Winchester Cathedral.

The works of consolidation of Winchester Cathedral, which have been in progress several years, have now reached their final stage. The cost has been very great, but £300K. is still required to complete the work of making the structure secure. The portion now in hand is the south side of the north wall, apart from the defective nature of the soil, was weakened by the removal of cloisters in the reign of Elizabeth, as no longer needed and for the value of the lead. The new foundations are carried down below the strata of water and peat to the underlying gravel, and the Norman wall of the north is to be supported—a much-debated project by a range of pinnacled buttresses of peculiar design with panelled sides projected 16 ft., but pierced with arches to provide footway.

Remains of various periods have been unearthed in the course of the excavations. These comprise some dating from the Roman occupation, others, such as a ring, chalice, patten and the remnants of a rich vestment indicate the site of the burial place of a prior.

Egyptian Portraits for the National Gallery.

The most important find of the British School of Archaeology in Egypt, exhibited last summer at University College, are from Hawara, and consist of portraits of the dead. In regard to these Professor Flinders Petrie under whose supervision the researches have been carried out, said to a representative of *Daily News* :—

"The first series was discovered as far back as 1888, and some of the finest are in the National Gallery. Some of the best of the remains will be added to that collection. They are portraits of men and women, and, judging from the style of dressing the hair, one can be far out of place in fixing the date to A.D. 100 to 250. A few are painted on canvas which appears to have been an earlier custom than the use of cedar panels. Some are painted in thin colour, apparently water-colour, perfect with white of egg as a body. The green number are painted with coloured wax, on a melted state with a brush."

Lincoln Minster.

MR. FRANCIS BOND and William Watkins contribute to the Royal Institute of British Architects' *Journal* year two papers which have caused a great deal of discussion. The plea "for the reconstruction of the accepted account of the building

Lincoln Minster: Wall Arcade, North Choir Aisle.

Lincoln Minster: Wall Arcade, Chapter House.

erations which went on in Lincoln Minster from 1192 to 1255," did not convince Professor Bethaby, who, with others, felt that the scheme set forth was so extraordinary that it could only be accepted on overwhelming evidence. Evidently, Mr. Bond and Mr. Watkins sought to prove fallacious the time-honoured belief that the choir of Lincoln Minster as we see it now—that of which St. Hugh of Avalon is supposed to have laid the foundations in 1192. Mr. Bond is convinced that both choir and transepts were originally unvaulted. Mr. John Bilson, on the other hand, thinks that beyond doubt Lincoln as planned from the first, and built, as a vaulted church. Whether or not the present triforium arcade is original and part of St. Hugh's work, the subject is of absorbing interest for Lincoln. "Canterbury done into English," is one of the most remarkable cathedrals in this country. The beautiful temples of Early English scroll work and foliage, shown in our reproductions of drawings by Mr. H. G. Webb, are features in which the building is particularly rich.

Excavations at Vale Royal. The hitherto unknown whereabouts of the Cistercian Abbey at Vale Royal, of Vale Royal which once stood at what is now Lord Delamere's seat in Cheshire have been ascertained by recent excavations carried out by Mr. Basil Pendleton, architect, of Manchester, on account of which has been published in the *Manchester Guardian*. Vale Royal was founded by Edward I. in performance of a vow made at sea when in danger of shipwreck, and the site is said to have been pointed out by angels and miraculous flashes of light. The King laid the foundation stone in person in 1277, but the Abbey was not consecrated till 1330, or finished till after that date. It was purchased by Sir Thomas Holcroft at the Dissolution of the Religious Houses, and used as a quarry for building stone, which is scarce in the neighbourhood. The entire fabric was thus razed to the ground, and practically no remains were visible.

It is now seen that the modern mansion is built upon the foundations of the buildings forming the west and south sides of the cloister, which stood to the south of the church. The latter proves to have been one of the very finest in the kingdom. The north transept is 70 ft. square, and the total length of the church is over 400 ft., exceeding Fontainebleau by some 15 ft.

Modernity at Avignon. If one were asked to instance the most flagrant example of the intrusion into reality of the spirit which actuated Mark Twain's hero in the realm of vulgar farce, one could give the occurrences at Avignon, which

became known last week. A certain pushful panderer to the baser palate of modernity offered the Municipality of the city of the Schiama a considerable sum for the privilege of giving spectacles and pageants through the medium of a cinematograph within the walls of the Papal palace itself. What a setting for his vibrant travesties! And, indeed, the city authorities, as ready as temporary custodians often are to sell their heritage in trust for the

customary mess of immediate gain, were for favouring the speculator's aspirations, and proposed to give them play. The Government, however—out of no consideration of the feelings of the Papacy, one must suppose, since they are now officially embittered and divorced—decided that the danger of fire to the fabric justified them in prohibiting the deal. Which is one way of preserving from desecration the sanctity of a shrine of the Historic Muse.

Lincoln Minster: Wall Arcade, South Choir Aisle.

THE BUILDING TRADE.

MEDIAEVAL BUILDERS AT WORK.

IT is very probable that to many the idea has more than once occurred how interesting it would be to see, if even but for a few moments only, the operations of building as they were actually in progress in the Middle Ages.

We cannot indeed see mediæval builders at work, but fortunately we can see drawings of such operations drawn by those who lived at the time.

Such drawings exist in the form of miniatures in mediæval volumes. To-day we place before our readers reproductions of eight of these little pictures. These represent a good deal of the building machinery and tools in use in the Middle Ages, as well as the dress of the working men operating them.

The pictures reproduced are all of the XVth century, and for the most part were executed in France, one alone being of English execution. They are faithful representations of actual scenes, and the shape and form of each tool is carefully drawn.

It will be at once noticed that in most cases the pictures are remarkably realistic -

Fig. 1.

the straight-edge thrown down on the ground, the squared stones lying about, and many other details lend a wonderfully vivid sense of reality to each little scene portrayed.

Our illustrations do not give an example of the hand mortar-board, the pictures in

Fig. 2.

which such occur offering little attraction except the representation of such boards. The mediæval mortar-board was exactly similar to that in use to-day. An example may be seen in the British Museum MS. 20 A.V.

The following orders respecting the hours of English working men in the XVth century will be found of interest in connexion with our pictures. The original document has been printed in Mr. Leach's "Beverley Town Documents," page 56.

From Easter to August 15, work began at 4 a.m. and continued till seven. At six a quarter of an hour might be taken for drinking, at eight half an hour for breakfast, at eleven an hour and a half for dinner and rest, at three half an hour for drinking.

After August 15 work lasted as long as it was light enough to work by. For breakfast half an hour was allowed at nine o'clock, and an hour at twelve for dinner; at three a quarter of an hour was allowed for drinking.

Fig. 3.

Fig. 4.

The Illustrations.

The originals of our reproductions are to be seen in the Department of Manuscripts at the British Museum. The pictures clearly tell their own story that little explanation need be added.

No. 1 (MS. 20 B. xx., page 82).—This little picture was painted in France. The manner in which the hod was carried on the ladder is well shown. The mediæval hod, though borne on the shoulder, as is to-day, had no stick. In the Middle Ages it was known in England as a "hott."

No. 2 (MS. 20 E. ii., page 262).—The interest of this picture lies perhaps chiefly in the arrangement of the scaffolding; the level, square, and compasses, etc., are faithfully depicted.

No. 3 (MS. Harl. 4,376, page 150).—These four little pictures, which are of French execution, though we see a large number of tools employed, mallet and chisel, trowel, etc., the most remarkable feature

Fig. 5.

of the picture is the machinery for lifting weights.

No. 4.—This picture is from page 206 of the same volume from which No. 3 has been taken. It is of value for its representation of a heap of mortar, etc. A little picture

Fig. 6.

page 2 of the Museum MS. Harl. 621 h, had it been sufficiently clear, would have been included in our reproductions) represents a heap of mortar ready for use. Near to the mortar is a frame on wheels, apparently designed to hold the wheel while it was being filled.

5 (MS. Nero E. ii., page 73).—This picture was painted in France.

6 (MS. 19,720, page 27).—This picture is a French execution. Here we have a full representation of mediaeval building, the whole scene being full of life and activity, and introducing to our notice many new features. The frame sawed by two men, the winch, and the barrow are all carefully drawn and noteworthy. Barrows in the Middle Ages were, roughly speaking, of two kinds—the barrow such as depicted here, the form of which is perhaps best reproduced by the barrow in use to-day in brickyards.

7 (MS. Aug. AV., page 22). Here we see the plumb line and level in use.

8 (MS. Harl. 1808, page 30).—This picture supplies us with no additional information, but it has a special interest of its own in the fact of its being of English manufacture.

MIDDLESEX NEW GUILDHALL.

At a special meeting of the Middlesex County Council on August 10, it was reported that fifteen firms had been invited to tender for the erection of the new Guildhall, and all had accepted, the figures being as follows:—J. Carmichael, 73,360*l.*; Dove Bros., 73,375*l.*; Leslie & Co., 75,049*l.*; Patman & Fotheringham, 75,723*l.*; Holloway Bros., 75,940*l.*; Wallis & Sons, 76,820*l.*; Lawrence & Son, 77,820*l.*; W. Johnson & Co., 78,500*l.*; Mowlem & Co., 78,941*l.*; Holliday & Greenwood, 78,980*l.*; Henry Lovatt, 79,470*l.*; Coster & Dickson, 79,997*l.*; F. & F. H. Higgs, 79,997*l.*; Treasure & Co., 80,495*l.*; Chas. Wall, 82,161*l.* The architect's estimate was 80,000*l.* The Committee recommended that the tender of J. Carmichael, Wandsworth, be accepted. The chairman (Alderman Rogers), in moving the adoption of the report, said the figures came well within the amount for which it was stated the new building could be erected. The tenders were extremely satisfactory, and he thought that the Council had every reason to be satisfied, both with the architect and the quantity surveyor, for the manner in which their work had so far been carried out. Mr. Warford-Davis, in seconding the motion, said he could not recall an occasion in his experience when the tendering for such a big job had been so remarkably close. In replying to a question, the chairman said that twenty-one months had been allowed for the work to

Fig. 8.

be completed. The consent of the Local Government Board had not yet been obtained, but the outstanding question was purely in regard to a detail, as to accommodation in cells, and he had no doubt the Council would obtain the Board's consent. The recommendation of the Committee that the tender of Mr. Carmichael be accepted was unanimously passed.

GENERAL BUILDING NEWS.

NEW CHURCH, WESTON-SUPER-MARE.

The contractors for this work are Messrs. C. A. Hayes & Sons, and the estimated cost of the work is 7,800*l.* The designs were prepared by Mr. G. P. Fry, architect, of Weston-super-Mare.

CHURCH, KINGSKERSWELL.

Mr. F. G. Moore, A.M.Inst.M.E., of Torquay, is the architect of this building, which has been erected at a cost of about 600*l.* The contract was carried out by Mr. H. Phare, builder, of Torquay.

CHURCH, ST. ANNE'S.

The designs for this church were prepared by Messrs. T. E. Davidson & Sons, architects, of Newcastle, and the accommodation is for 500 people. The builders were Messrs. F. T. Salmon & Co., of Cudworth.

SYNAGOGUE, SOUTHEAD.

This building, the foundation stone of which was laid recently, is to be erected at a cost of 2,070*l.*, not including heating and lighting. The contractors are Messrs. E. Leane, and the architects are Messrs. Bertram, Parkes, & Evans.

NEW COLLEGE, DUNDEE.

A new training college is to be erected in Dundee at an estimated cost of about 60,000*l.*, and the building will cover about one and three-quarter acres of ground. The architect for the work is Mr. T. Martin Cappon, F.R.I.B.A., of Dundee.

BATHS, WOOD GREEN.

Swimming, douche, and slipper baths have been built by Messrs. Davey, of Southend, at a cost of about 10,000*l.* A sliding roof has been constructed, and an up-to-date laundry is attached. The architect for the work is Mr. Harold Burgess.

RAILWAY STATION, MONTREAL.

The new headquarters for the Canadian Pacific Railway Company have been erected from the designs of Mr. W. S. Painter, the architect to the company, and it is expected that the building will be ready for occupation by the early part of next year. The contractor is Mr. C. E. Deskin, and the contractors for the steel work were the Dominion Bridge Company.

TRADE NEWS.

The fireproof partition blocks (hollow and solid) for Mark-lane Station, Metropolitan Railway, are being supplied by Messrs. J. Wright & Co., of New Malden, Surrey, and

Fig. 7.

9, Regent Street, S.W. The contractors are Messrs. Ford & Walton, High-road, Kilburn. Nos. 157/158, Great Portland-street, W., are being rebuilt by Messrs. E. A. Roome & Co., of 36, Basinghall-street, E.C., and Homerton, N.E. Messrs. Roome are executing alterations at 90, Commercial-street, under the superintendence of Messrs. Still, Wheat, & Luker.

PENDING TROUBLE IN THE BUILDING TRADE.

Following on the successful strike of transport workers, it is stated that preparations are being made for a similar strike amongst the labourers employed in the building trade. For some time past there has been much dissatisfaction among the men over wages, hours of labour, and general conditions of employment. Probably the movement will be undertaken by the Transport Workers' Federation.

PROJECTED NEW BUILDINGS IN THE PROVINCES.*

ABERDEEN.—Additions, Robert Gordon's Technical College; the Governors' Picture palace, Union-street, The Britannia Cinematograph Theatre, Ltd.
Aberthaw.—Forty-five houses; Crumlin Building Club.
Aberystwyth.—Club house (1,300l.), for new Golf Club.
Alfreton (Hants).—Master's house, Perin's Grammar School; the Managers.
Ancoats.—School, George Leigh-street (3,100l.); Mr. J. H. Reynolds and Mr. C. H. Wyatt, Secretaries, Education Committee, Manchester Town Council.
Ashton-under-Lyne.—Sunday school (1,000l.); the Trustees, Hurst Brook Primitive Methodist Chapel.
Atherton.—Engine-house, etc., for Atherton Cotton Spinning Company.
Audenshaw.—Proposed church; Trustees, St. Stephen's, Denton-road Mission.
Aylsham.—Alterations to laundry, etc. (2,300l.); Mr. J. H. Gidney, Clerk, Board of Guardians, Aylsham.
Bagley.—Converting hospital into consumptive sanatorium; Mr. Harry F. Bull, Surveyor, Cheshire County Council, Chester Castle.
Ballywater (Down).—New rectory; the Vicar Batley.
Alterations to Wilton Arms, Commercial-street, the Managers.
Baxley.—Proposed baths; Mr. W. T. Howe, Surveyor, Bexley Urban District Council.
Biggar Bank.—Tramway waiting-room and conveniences (500l.); Mr. Arthur Race, Surveyor, Barrow-in-Furness Town Council.
Bishop's Stortford.—Proposed assembly hall, Bishop's Stortford College (3,500l.); the Governors.
Biispham.—Additions to Endowed School; the Trustees.
Bitterne Manor.—Proposed infants' school; Mr. W. J. Taylor, Surveyor, Southampton County Council.
Blackwood.—Police station, etc.; Mr. Wm. Tanner, Surveyor, Monmouthshire County Council, Newport.
Blaonagwr.—Three hundred houses; International Colliery Co., Ogmogre Vale.
Bolton.—School (11,800l.); Mr. F. Wilkinson, Secretary, Education Committee, Bolton Town Council.
Bridgetown.—School (2,400 l.). Mr. S. Wootton, builder, Bloxwich.
Bridgwater.—Court-house and police station (7,350l.); Mr. J. E. Fursland, builder, Bridgwater.
Bridlington.—Christ Church Parish Hall (1,700l.); the Trustees.
Briton Ferry.—Projected works for the North Central Wagon Company.
Brookhurst.—Enlargement of church school; the Managers.
Bury.—Shop and three houses; Bury District Co-operative Society. Alterations to bank, Fleet street, for Parr's Bank, Ltd.
Camborne (Cornwall).—Alterations to Basset Arms for the Redruth Brewery Company.
Casidery.—Residence (1,000l.); Messrs. R. E. Buchanan & Co., architects, Londonderry, Chapel-on-le-Frith.—Extensions to Town End Foundry; the Managers.
Clydebank.—Public library; Messrs. Stewart & Patterson, architects, 14, Blythswood square, Glasgow.
Colebrook.—New Vicarage (1,000l.); the Vicar.
Cowie.—Three hundred houses; Alloa Coal Company, Cowie.
Cwm.—Fifty houses: Architect, care of Mr. D. C. John, Town Clerk, Swansea Town Council.

Cwmfelinfach.—Workman's Institute; Mr. R. L. Roberts, architect, Abercrom.
Damerham (Hants).—Extensions to Council Education School; the Managers.
Danby.—Extensions to Howell's School; the Governors.
Dewsbury.—Fire stations; Mr. H. Dearden, Surveyor, Dewsbury Town Council.
Doncaster.—School (1,900l.); Messrs. Dunn & Mondham, architects, Birmingham.
Dover.—St. Mary's Parish Hall (1,320l.), Mr. G. Munro, builder, Union-road, Dover.
Dumbarton.—Alterations to poor house (2,600l.); Mr. J. Briggs, Surveyor, Dumbarton Town Council.
Eastleigh.—Technical school and pupil teachers' centre; Mr. W. J. Taylor, Surveyor, Southampton County Council.
Edenfield.—Liberal Club, Elm street; Secretary, Liberal Club, Ramsbottom.
Edmonton.—Three workshops (900l.); Architect, care of Mr. F. Shelton, Clerk, Board of Guardians, Edmonton.
Eldon.—Church hall, St. Mark's (1,400l.); the Trustees.
Elham.—Hospital (3,500l.); Clerk, Board of Guardians, Elham.
Epping.—Infirmary, etc. (7,950l.); Messrs. R. Forrester and H. White, Surveyors, Epping Rural District Council.
Erdington.—Conservatory and two sets of double green houses (550l.); Mr. H. H. Humphries, Surveyor, Erdington Urban District Council.
Farley Chamberlayne (Hants).—School; Mr. W. J. Taylor, Surveyor, Southampton County Council.
Frimley.—St. Andrew's Church, Frimley Green (2,000l.); the Trustees.
Gillingham.—New mission hall; Deacon J. Ebenezer, Congregational Church, Gillingham.
Glenagary.—New parish hall, Adelaide-street; Messrs. W. Mitchell & Sons, architects, St. Stephen's Green, Dublin; Messrs. Callen Bros. Ltd., builders, 5, Clanwilliam-place, Dublin.
Guilford.—Twenty houses (3,400l.); Mr. C. G. Mason, Surveyor, Guilford Town Council.
Conversion of old corn market into Council Chamber (1,000l.); Mr. C. G. Mason, Surveyor, Guilford Town Council.
Hailestead.—Proposed baths; Mr. Walter Cressell, architect, Colchester.
Harrogate.—Warehouse, Regents-parade, Harrogate, and District Co-operative Society.
Hemel Hempstead.—School, Two Waters (3,200l.); Mr. O. P. Dwyer, builder, Kettering.
Hove Factory.—Mr. Wm. H. Overton, architect, Warnham House, 22, Ship-street, Brighton. The following plans have been passed: Additions, Goldstone House, Fonthill road; Mr. G. H. Burrows for Mr. J. J. Clark. Conversion premises, 88, Church-road, into flats and shop; Messrs. Albery & Lawrence for Mr. A. W. Wells. Additions to garage, Seaford-mews; Mr. F. C. Axtell for Mrs. Youle. The following plans have been lodged: Garage, Langley-gardens, Mr. G. H. Burrows. Sixteen houses, Tandridge road; Mr. S. H. Burwood.
Howden.—Isolation hospital; Mr. J. Anderson, Howden Rural District Council.
Ilkeston.—School, Binnerley street (340 places). Mr. W. Lissac, Secretary, Education Committee, Ilkeston Town Council.
Ilchen.—Additions to Ludlow-road School (350l.); Mr. W. J. Taylor, Surveyor, Southampton County Council.
Kenilworth.—School; Mr. J. Willmott, architect, 6, Waterloo, Birmingham.
Killiney and Ballinacree.—Dwellings for Urban District Council; Messrs. Miller & Symes, architects, 60, Dawson-street, Dublin.
Knottingley.—Extensions and alterations at National Schools (920l.); Mr. J. H. Waite, builder, Calder-grove, Crigglestone, Wakefield.
Lakenham.—School (370 places); Messrs H. Ramage and O. D. Holmes, Secretaries, Education Committee, Norwich Town Council.
Lambourn.—Sanatorium; Mr. John Bowen, Surveyor, Town Hall, Reading.
Langley Green.—Pattern shop, etc., at works of M. Messrs. Ham Baker & Co.; Messrs D. & A. Home-Morton, architects, Birmingham.
Mr. G. A. Horton, builder, Brierley-hill.
Leiston.—Enlargement of school (600l.); Mr. W. E. Watkins, Secretary, Education Committee, East Suffolk County Council.
Liversedge.—New stores; Secretary, Mutual Co-operative Society.
Loughborough.—Extensions to factory premises, Derby-road, for Messrs. Hanford & Miller.
Maghera (Co. Derry).—Additions to St. Patrick's Church; Mr. J. McGrath, architect, Commercial Buildings, Fovele-street, Londonderry; Messrs. J. Bellintine & Co., Ltd., builders, Strand-road, Londonderry.
Marshall.—Extensions to Marshall Home for Boyles; the Managers.
Manchester.—Tower and spire, St. Alban's Church, Waterlot road (1,300l.); the Trustees.

Mathill.—Additions to school; Mr. C. Rwing, architect, Grief.
Monkton.—School (950l.); Mr. W. P. architect, Prestwick.
Morriston.—Extensions to tin plate mill, the Dyffryn Tinplate Company.
Mottingham (Kent).—Almshouses for the Homeless Company, 117, Fenchurch-street, E.C.
Newport (Mon.).—Assize and law court; Architect, care of Mr. S. S. Newman, Town Clerk, Newport Town Council.
Ogmogre Vale.—Two hundred houses; Messrs. Lewis Merthyr Company, Ogmogre Vale.
Panteg.—Alterations and additions, Hilda's Church School; the Trustees.
Penistone.—New offices and public hall, joining free library; Mr. J. Swift, Borough Surveyor, Penistone Urban District Council.
Penybont.—Forty houses, The Craig, Cribbourn; Mr. R. Rankin, builder, Penybont.
Pennypark.—Improvement at Council School (500l.); Messrs. Michael & Son, builders, Gilgerran.
Plymouth.—Adaptation of old free library for rate offices; Mr. J. Paton, Borough Surveyor, Plymouth Town Council. Clean streets, Granville-street (170l.); Mr. J. P. Borough Surveyor, Plymouth Town Council. Extensions to St. Boniface School, Girls' parlour (eighty places); Mr. J. P. Borough Surveyor, Plymouth Town Council. The following plans have been passed: Alterations and additions to premises, 55, Mutations and additions to premises, 55, Mutations, for the Plymouth Co-operative Society. Alterations and additions to premises at 102 and 103, Old Town-street, for Messrs. Butt, Vosper, & Knight. Store at Addison-factory, for Messrs. Clatworthy & Co., alterations and additions to E. & T. Thorsley, North-street; the Managers. Buildings read of premises, Frankfort-street, for Messrs. Winnicott Bros. The following plans have been lodged: Motor garage, of premises, 25, Atheneum-street, for Mr. J. Coker. School buildings at public square, Coburg-street; Mr. W. H. May, architect, Pontefract.
Pontefract.—Baths, Headlands (4,500l.); architect to be appointed.
Portrush.—Hotel, café, and shop, Eight street; Mr. A. J. Clark, architect, 2, Cavan, Portrush.
Reading.—Mortuary; Mr. John Bowen, Surveyor, Reading Town Council.
Romford.—Four shops, Balgore-square, the Colonade Construction Company.
Ross.—Free library; Mr. A. H. Penney, Surveyor, Ross Urban District Council.
Sandown.—Enlargement of fire station, convenience (360l.); Mr. Leslie P. Dwyer, Surveyor, Sandown Urban District Council.
Scunthorpe.—School (11,200l.); Messrs. Gill & Sons, builders, Nether Hall-road, Scunthorpe.
Sholing.—Additions to Infants' School (510l.); Mr. W. J. Taylor, Surveyor, Southampton County Council.
Sleaford.—Drill hall, Church-lane, for Church Lads' Brigade.
Spencerwood.—Isolation hall, bus premises, etc.; architect to be appointed.
Stafford.—Public library; Mr. W. H. Borough Surveyor, Stafford Town Council.
Street.—Housing scheme (7,000l.); Mr. Pursey, Council Surveyor, Street Urban District Council.
Sunderland.—Alterations to St. St. Church, Meaburn-street; the Trustees.
Thurso.—N.B.—Hospital, Durness-street, Thurso Town Council.
Tunbridge Wells.—Rebuilding Bell Mount Pleasant; Messrs. de la Beche, builders, 34, London-road, Tunbridge Wells.
Walesby.—Church (2,000l.); the Trustees.
Walsall.—Underground convenience, Bridge (1,690l.); Messrs. Henry Gough & Partners, Countess-street, Walsall. The following plans have been passed: Premises, Bullocks Fold, Bloxwich; Mr. S. W. Extensions to premises, Neale-street; Mr. Walsall Locks and Cart Gear Company, houses, Green-lane, Leamore; Mr. J. W. Alterations to premises, The Bridge; W. Unionist Association. Additions to Ironworks, Green-lane; Messrs. The Stamping Works Company, Warehouse, more; Messrs. Withers, Ltd. Rebuilding premises, Park-street; Messrs. THE PRESERVATION OF OLD BUILDINGS.

On March 1 Mr. W. A. Forsyth, F.R.S.A., read a paper before the Manchester Society of Architects on "The Preservation of Old Buildings," from which I take the following:—

I propose to direct my remarks towards principles involved in the maintenance of an average English village church or parsonage, and in so doing will endeavour to avoid reference to much that is generally accepted, while considering firstly what shall be preserved, and then the means to be adopted.

In all cases great efforts should be made to maintain all that is fit and sound, and all that is repairable in order to express the history or evolution of the building, apart from considerations of taste or fashion, and any cases of convenience. It is no hardship to adapt one's mode of living to the internal arrangement of an old house. It is always possible to make full use of a medieval church for the ordinary purposes of worship, although the accommodation for accessory functions may be lacking. Similarly, all the fittings and parts whose old places should be respected and retained.

The Town Planning Act of our own day respects ancient monuments, even though the realisation of the municipal authority's great scheme is thwarted by the retention of an historic building. In that respect it is a subject of congratulation that the Legislature has come to its senses in preventing destruction of historic monuments by improvements.

It is necessary, however, for some legislative protection of our ancient churches to minimise more apparent day by day. The things are but the temporary custodians of the churches, yet it is a frequent occurrence to find a newly-appointed vicar anxious to mark his acceptance of office by the proposal of a scheme of additions or changes to the structure with which his many predecessors found it convenient to dispense. Village churches are national monuments, and as such, should be protected by the Legislature.

The Ecclesiastical Commissioners have opportunities for undertaking work of this kind, but their methods and processes do not fit them for the task. Their sympathies are not entirely directed to the monumental character of the subject, and, moreover, no body or institution can undertake the supervision of all the actual work or, indeed, the responsibility.

It is the types of buildings we are considering that is of paramount importance that the repairs and other operations should have high qualities.

The church and the manor-house have survived centuries of use and climatic resistance because of the solidity of parts, the quality of construction, excellence of materials, and sound workmanship. These are the qualities which are necessary to our survival. Is it not pathetic to find an historic church having its Victorian restoration renewed at this early date?

It is also important that all works be given a reasonable time in execution.

The state of repair arises in most cases from the unequal settlement of walls. Roof leaks, movement of soil, surface and underground drains, and other excavations are the contributory causes. Very frequently they are found to incline at dangerous angles, and are very often rebuilt without investigation, whereas a study of the foundations, the drains, and any recent movements would perhaps prevent the retention of the work.

Drawings.

Before anything can be attempted in the way of restoration or the actual work of repair begun, complete and careful drawings must be made. These drawings must accurately represent all irregularities of plan and sections of walls and floors. This can be shown when all drawings are free-hand. A ruled plan or elevation cannot be made.

Specification in complete detail is essential, and all practical operations as well as

the use of proper materials must be clearly described.

The drawings will serve to show the approximate extent of the work. Careful measurements reveal surprises in the structure not otherwise to be ascertained.

Photographic records are also valuable. All the materials of floors, hearths, walls, ceilings, roofs, and other features on the drawings should be described. The condition of repair, together with an historical survey, should be embodied in a general description of the work prior to repair. Tenders should be avoided; they lead to an unsympathetic handling of an old building. An approximate estimate, combined with a schedule of prices for labour and materials, and, above all, an honest builder, is all that one may reasonably ask for. I know of no more satisfactory method than a 10 per cent. profit arrangement and schedule of prices. The architect must be competent, and not too busy personally to supervise the work.

Speed in Building.

It must be admitted that, apart from other influences, the survival of ancient building works is due in great measure to the actual duration of the building operation.

Buildings of permanent intention, constructed for peaceful enjoyment and not defensive purposes, must receive climatic considerations in erection or repair. Foundations or underpinning should not be undertaken until the drainage of the soil is completed, or the ultimate condition of the land assured. Shoring should be perhaps unduly strong and allowed to stand for an excessive time before being struck. Brickwork in lime mortar cannot be hurried, and must be built in a very wet state and allowed to set before receiving weights, thrusts, or other causes inducing movement. Plastering should be not unduly delayed, but a long period of setting should be allowed. Strong draughts should be excluded, as well as heat and other influences inducing rapid setting. Materials resembling the old should, of course, be used, and this will exclude the use of patent plastering processes from the building, and, incidentally, from the scope of this paper.

Roof timbers which have been exposed to sun and rain should have reasonable time to return to their normal seasoned state when roof coverings are finished, before such things as ceilings are erected.

Good work, therefore, requires proper time for its execution.

Foundations.

It is remarkable that the types of structures we are considering received comparatively little attention in the matter of foundations. In the majority of cases little or no increase of width was made, but reliance was placed entirely upon the soil or earth upon which the thick walls were directly founded. Yet it is abundantly clear that foundation work was well understood.

The subsequent laying of drains, putting up of rain-water gutters and pipes, and the digging for graves and heating chambers have caused great havoc to the structure of old walls.

A village church is often very much the better off by the absence of eaves gutters and down pipes. This ensures a more general distribution of roof water. Paving should be laid around the building to catch and remove rain dripping from the eaves and walls. Water concentrated from a valley or from the gutters of flat roofs can be specially dealt with by shoots.

The drains of a house are examined by municipal authorities, to the gain of the inhabitants; those of a church or cathedral take care of themselves, to the detriment of the fabric.

The incumbent of a church in Norfolk once took me to see the position of a mysterious spring below the north-east corner of his church, pointing out the consequent mossy growths inside as well as out, and the existence of active settlements in the wall. A brief examination showed that the entire trouble was due to a broken and neglected rain-water pipe, which had been belching concentrated water into the base of the wall in question for many years. This not an unusual incident.

As illustrating the knowledge in early times of the actions of soils, the following interesting precaution, taken by a XIIIth-century builder, came to my notice in underpinning a buttress and circular staircase of a church tower. At Chattisham, near Ipswich, the land is entirely a stiff clay.

As frequently happens in church towers, the weakest angle is that containing the turret staircase, and in this instance it had, along with a rubble and stone buttress, settled considerably from causes traceable to a defective drain. The remainder of the tower walls were in fair condition.

On examination it was seen that in building the tower a large pit had been dug extending 1 ft. 6 in. beyond the area of the structure. Into this hole, the sides of which were in places clearly disclosed, had been thrown river gravel of coarse quality, and upon it the rubble walls of the tower were erected. It will be noticed that there is an almost entire absence of footings, and that the bases of the walls are perilously near the surface of the ground, yet the tower generally has stood these 600 years remarkably well. The limitations of a clay soil were evidently understood in these medieval times, and the instance is one by which we should profit.

In some Norfolk churches some unusual yet reasoned provision is made in the foundations. Thus, for instance, at Saxthorpe the foundations consist of thin layers of various materials, the reasons for which are difficult to comprehend. At the bottom of the trench, in a loamy soil, is placed 6 in. of chalk, then follow alternate layers of 3 in. of mortar and 3 in. of sifted earth, these two layers repeating three times producing 18 in. in height, and upon this the rubble walls are built.

Rubble Walls.

In rubble walls, all small material, such as flints, pebbles, fragments of stone, bricks, and tiles were mixed with lime mortar. The whole was worked up and laid in a concrete manner in conjunction with stone or brick quoins set in the internal and external angles. My friend Mr. Gaymer, of North Walsham, who has given close attention to this work, assures me that the rubble could only have been laid against boards or centering in the same way as we build concrete. He further assures me that he can point out places in Norfolk where the marks left by the joints in the boarding show upon the mortar faces.

It will readily be understood that the use of angle stones was twofold; firstly, to facilitate the accurate building of rubble, and then to afford greater permanence to the exposed angles from the effects of winds, rain, and frosts.

Rubble walls have been, and are generally to this day, misunderstood by architects and builders. It is their invariable custom to point or key the spaces between the aggregate materials after the matrix mortar has to an extent been removed by weather. The pointing is moreover usually performed with the aid of a metal trowel.

In almost all cases, no pointing is required. The faces exposed to the rainy quarters are those mostly found to have these interstices washed out, but it is only in the dire extremity of the solid materials having become loose, that any repair is necessary, and indeed can be efficiently performed.

Stone facing does not imply strength when the core of the wall is found to be of rubble. As a rule, bonding stones were absent in the great ashlar-faced walls of the early periods, and the slightest failure of footings set up great cracks in the masonry.

In rebuilding dangerous buttresses, I have reset the old stones of the angles and offsets, re-using the general walling materials in concrete fashion. After some small instruction the bricklayers or masons grasp the spirit of the old work, and produce a rubble wall exactly resembling the original, and, what is most important, of apparently considerable durability. Bonding stones to internal angles are essential. It is of great importance that stone or brick work should be effectively worked in with offsets in rubble work.

It is extremely interesting to trace the early attempts at flint facing, and the development from the rubble wall. The earlier work, sometimes "boulder," sometimes "napped," had heavy joints and rough laying. The introduction of traceried panels in plinths and parapets produced greater precision and definition in the flints,

until the art culminated (and, indeed, disappeared) in the exquisite work of the late XVth century. The parish churches of Norwich are wonderful examples of the perfection to which flint facing was carried. In all cases flints used in repairs should be "dug," and not used from surface collections.

Stonework.

Roughly speaking, there are nowadays found three distinct schools in the preservation of ancient stone building—each having its enthusiastic adherents. The first may be called the "Limewashers," and the second the "Replacers," and the third the "Fakers."

The creed of the first is very difficult to define, and their operations, complicated as they are, impossible to reason up. If a stone mullion is crumbling to atoms, it is repaired with brick or roofing tiles, and the piece is smeared over with mortar, yet with no intention of desiring to imitate the material of the destroyed feature. They are particularly anxious that their patching should reveal itself for all time. There is a strong sentiment against attempting to repair in the actual form and material of the original, and to a certain extent they are justified by the glaring results of the second school, whose entire creed is to "cut out and replace with new to match," and also to show for a limited period of time that the building has been restored. The delight of the third order is to deceive, and, if the stone mullion cannot be operated upon *in situ*, the pieces are removed and reset in cement or some other medium, or new stone, artificially coloured, is built in so that all evidence of renovation is lost.

It is extremely difficult to say which is the most desirable or correct of the various processes. There are errors and inconsistencies in the claims of each, yet there is much that is necessary in all.

Let us take a City—say, Oxford—which is rich in historic buildings. Everyone regrets the extraordinary condition of decay which has taken place in the Headington stone in buildings of the XVIIth, XVIIIth, and XIXth centuries in that town.

In nearly all cases extensive works of restoration have been carried out during the last few years by the "Replacers" school. At the present time the principal buildings look as if they were new. The Great Tom Tower and south front of Christ's College are practically entirely rebuilt; even the carved ornament is renewed. Drastic measures have been taken, and one cannot but regret that such methods were carried on to so extreme a course. A very interesting work of the "Limewashing" school has, however, been lately finished in the repair of the garden front of St. John's College by my friend, Mr. Redfern. As showing the extreme care exercised in its execution the architect performed much of the actual work with his own hands.

As in other Oxford buildings, the stonework was in an advanced state of decay, but the method of repair has been that advocated by the Society for the Protection of Ancient Buildings. No new stone has been introduced. All badly-decayed stone was removed, and patches of roofing tiles built in lime mortar. The red patches were then smeared or rendered with the mortar. Mullions and other features have been similarly treated, and in all cases the sections of the original mouldings have been continued in the mortar patches. I cannot see how this process can be regarded as permanent. Reference has already been made to the failure of the Victorian stucco, which would appear to be similar in treatment. Already parts of the rendering on the face of the parapets are cracking and the tiles grinning through. The edges of these tiles should be dated.

At Westminster Abbey a great work in limewashing is being carried out by Professor Lethaby. The principal original material is a Reigate freestone. Upon most of the exterior this has been, in former times, largely replaced by other varieties of stone by the "Replacers" school. The remaining stone, having external exposure, is fast decaying in the atmosphere of London, but the destruction is being arrested by the simple application of limewash. The operation consists of the slaking with boiling water of Barrow hydraulic lime to produce a comparatively fine solution or paste, and of the application

by means of a brush of two or more coats according to the state of decay. To avoid glaring results, some colour is utilised to assimilate the tone of the applied material to its environment.

The process has been going on in the vaulting of Cloisters for some four years, and is found to be a successful "healer" of the diseased stone where applications of other reputed preservatives have failed. In appearance, too, the effect is good, as after the lapse of time the lime appears to have entered into structural combination with the stone and mouldings, joins and other details become sharper and well defined. It is satisfactory to think that the spirit of the beautiful early work in these Cloisters is retained by so simple a process. The idea is not new, for it will have come within everyone's observation that a whitewashed stone wall is often preserved when the untreated surfaces of the same wall have perished. It is in the nature of a revival. This limewash is gentle in its nature. Let us beware, however, of advertised patent preservatives, which claim strong silica for their purpose.

I have been informed that frequently these solutions produce worse results after the lapse of time. The first application penetrates let us say $\frac{1}{4}$ in. and then hardens. The subsequent coatings cannot therefore penetrate beyond this first treatment, and a thin, hard face is produced. If by any chance the wall receives moisture from behind, or wet gets through the joints or settlements, frost removes the artificially-produced face in unpleasant quantities.

It is very rare that one finds the work of the "replacing with new" creed accurate in its attempt to imitate old work. Take such a simple instance as the piecing of a mullion. The hollows are invariably made too quick, not only failing to resemble the old section, but giving a hard, cast-iron character to the work. The varying substances of the stone tracery in the mullions and cusped heads, difference in internal and external arches, and many another subtlety are not detected, and a harshness again results. Joints are made too thin, and the natural tooling operations of the mason fail to receive expression by the subsequent smooth finish, chiefly produced by the thoughtless use of the "drag."

Of the third school of repair there is much to be said in commendation of its work so long as it is restricted to maintaining what exists. It has, however, become so skilful that it reproduces old features *ad libitum*, resorting to endless devices to complete the deception. New stonework is roughed and injured as though by long use. Steps are worn down to order. Cow-dung solution is applied to represent the effects of external exposure. Moss is cultivated on roofing tiles. Oak receives a sandblast treatment, or is adzed after being previously planed, while limewash stains and other applications produce smoky deceits. Of all this, nothing is to be merited but our contempt.

It has long been my theory that arches, vaulting ribs, and other curved moulded work were erected in a roughly-squared state upon centering, and the mouldings and other enrichments subsequently worked in position. String courses and cornices were perhaps cut before fixing, but circular work, judging by its wonderful accuracy of line, appears to me to have been finished after building.

In proof of this, I recently saw a simple example at Repton Priory of transitional XIIth to XIIIth century vaulting left in an unfinished state. The ribs were built of squared stones roughly tooled. The centre boss has been carved and a few dog-tooth ornaments and a moulding commenced, but never finished, yet the place (now used as a lavatory) has been in continuous occupation for 700 years. Arches of windows occasionally indicate that the moulded work was prepared before fixing, and in that case there is not the usual freedom of line found in the beautiful work cut *in situ*.

Mr. Gayner assures me that in examining the stones of vaulting ribs which have fallen or have had to be taken down, the sections of the mouldings vary according to the plane of the joint in such a way that a template could never have been used to strike the outline of the moulding upon the material when lying on the mason's banker. I shall be glad to hear of corroborative experience, but the object in raising the point is to draw

attention to the desirability of pursuing similar methods in works of repair.

The Constructional Uses of Metal.

The use of wrought-iron tie rods in taking up thrusts in brick and stone walls, piers, arcades is one which should receive great attention from architects. The principle to be found in early XIIIth-century work when perhaps the chief example in this country is the reinforcement of the vaulting of the aisles in Westminster Abbey. Earlier ties were made of oak, but wrought iron was soon substituted, but only a few the former remaining. Professor Lethaby assures me that this is original work. It carried out throughout the triforium arch and other places.

In all these cases the metal ties are subjected to more or less the uniform temperatures of the interior. The case is different, however, in the reinforcement, which is again found in the large windows surrounding the Abbey, where the bars take up tensile strain and are independent of the saddle bars of glazing. Here the metal-work is exposed to great changes of temperature, and the constant movement of the rods is perhaps one of the causes which have necessitated almost entire restoration of the external stonework. The constructional wrought-iron in Westminster Abbey is a large subject, which will repay a full investigation.

Metal associated with stone, concrete, brickwork should be sparingly used. Iron ties, cramps, dowels, and saddle-bars in ruined masonry to an alarming extent, should be avoided when possible. Slits, finis, and pebbles are frequently usable dovetailed cramps, pins, and dowels.

Tile Roofing.

The repair of old tile roofs is a matter deserving our caution. Into the numerous methods of laying tiles throughout the country, it is not within the intention of these notes to enquire. What is of paramount importance, however, is the quality and in this respect I would urge the use of hand-made, sand-faced tiles to entire exclusion of machine-made or pressed materials. Old roofs appear to gain in interest when the repairs are visible. It is not always possible to secure old weathered tiles for repairing ancient roofs. Rough well-burnt materials should, however, be used and the tiles should possess considerable "camber," not only in their length, but the width. They should also have general substance. The cambering of tiles is perhaps the most important quality in their manufacture. Capillary attraction is thereby reduced to a minimum and the air spaces formed are valuable for assisting evaporation of moisture, and in preserving the tiles. To exclude draught and driving snow from tiled roofs, it was the ancient custom to the tiles in hay or straw. In Norfolk spaces between the laths were filled with reeds. In each case, however, the packing material was kept away from contact with ordinary rains, and was confined to the backs of the tiles. Evaporation was but slightly arrested. In all cases counter-battening is essential to the successful use of tiles. These under battens, if laid diagonally brace the roofs against wind pressures, provide a wonderful way, and provide a convenient means for fixing laths when plastering between the rafters is desired. The bedding of tiles is to be avoided, as, amongst other risks, tails are liable to be broken in frosts. Tiling is good when used to a limited extent.

The rounded valleys of old roofs are delightful features—to the eye. But it is rare to find to what extent they have been, indeed, are always being, repaired. Bedding was the principal method of fixing. I dare to think that most of these old examples were unworkmanlike for the simple reason that in endeavouring to maintain uniformity of the horizontal courses, the in the centre of the valley lost their "lay" that is to say, these particular tiles were made long enough in order to provide adequate lap to meet the flatter slope of the valley naturally answers.

A very good way of producing rounded valleys, although at the expense of maintaining the horizontal courses, is to fix out width of 15 in. and to hand "tile a half" diagonally up the centre of the valley.

The ordinary courses follow from these middle ties, and the extra lap in the valley is thus provided for.

Timber.

There is only one timber. It is English oak, and there is no substitute or anything approaching it for power and beauty—when properly used and cut. English oak, probably in account of its slow growth, has a wonderful heart, the virility of which the calculating formulae are incapable of expressing. The framing of timbers was well understood by medieval builders, and reached a state of real perfection. The science was applied to walls, roofs, floors, staircases, and the like. The best work of the earlier periods relied upon the one material in the mortises, tenons, pins, dovetails, and joints generally. Wrought-iron was employed in later times, when the practice began to wane, and less thorough methods obtained. It is curious that the acid of oak should attack and corrode iron nails and fastenings, which probably explains much of the earlier disuse of iron with oak. Many a sound timber is removed from an old building because the top and waxy edge is rotten. When occasions arise for repairing an oak roof, it is essential that all work be done in position in order to avoid the taking down of old rafters, tie-beams, purlins from their first position. Old seasoned material should in all cases be employed, and no attempt made to conceal or lapped or scarfed joint.

The persistent thrust of timber roofs induce eaves, piers, and arches to move in a sure, main firm. It is invariably possible to rest these thrusts in a simple way without disturbing the inclined masonry. Iron ties should be thoroughly painted before and after king. Lead gutters should be taken up in order to examine the condition of wall plates in unperceptible manner, whilst the foundations and the ends of tie-beams.

Lead Roofs.

It is perhaps unnecessary to remind architects that cast-lead sheets are preferable to the rolled quality. Recasting old lead should be done on the site of the building under repair. Flats should receive a fair slope of at least 1 in. in twenty-five or twenty. Boardings must be run parallel with the fall. Welts could, if possible, be used on church roofs. Good rolls, when used, should have grooves in the throats to arrest capillary attraction. Ripps should have similar provision.

Asphalt.

Few materials require more careful selection than asphalt. It is extremely difficult for architects to tell good from bad; it is, however, essential that the bitumen should be thoroughly distilled before mixing with waste asphalt, and devoid of fibre. It is especially valuable in covering old copings of cornices, rendering their preservation comparatively easy without disturbing the work.

Thatching is coming into greater use again. The revival would be more general but for the caution demanded by local authorities and insurance companies.

Reed thatching, as laid in the county of Norfolk, is the best material and most attractive in appearance.

Thatching appears to have produced the types of roofs upon which tiled forms have been based. Hipped roofs are distinctly archaic in their origin. Thatch gables are at the most desirable features for durable building.

Plastering.

In no department of our work is greater care required than in the manipulation and application of plaster. In old buildings extra caution still is necessary in order to secure adhesion of new material to old surfaces. Material is all important. It is not necessary to remind those concerned with old places of the presence of flintings and other decorative works below whitewashed faces; the preservation of these colourings is a matter apart from ordinary structural repair, and should only be undertaken by those much accustomed to the work.

Repairs to plan plastered surfaces should extend to the actual defective area: the preparation to replaster a whole wall for uniformity and appearance should be avoided. Finishes must be reliable and of known

condition. Sand cannot be too coarse or clean. Hair should be obtained from tanneries where the old-fashioned process of detaching by the immersion in lime is still in force. Most hair now in use is removed from hides by means of chemicals, and is in consequence brittle. Plastering can be applied in one coat. No more than two, however, are necessary, and it should always be spread and worked up with wood floats. No trowels are required in this trade.

Smoothness of finish, which is always out of scale, as well as sympathy, is thus avoided in wall treatments. Rough plaster also dries out a much less degree than fine finishes.

In conclusion, I would urge that, whatever be the nature of the building with the repair of which we are concerned, a complete record should be made of the actual works undertaken, including plans showing the state of the building prior to, and the condition of the work after, repair, a description of the process, and an account of the cost.

This should be made obligatory upon an owner or incumbent."

LAW REPORT.

BEFORE THE OFFICIAL REFEREE
(MR. MUIR MACKENZIE).

Contractor's Action against Building Owner. Minter v. Waldstein.

THE hearing of this case was continued last week, it being an action brought by Mr. F. G. Minter, a builder and contractor, against Mr. Charles Waldstein, Professor of Art at Cambridge University, from whom he claimed £2,750, the amount payable in respect of a certificate of Mr. Frederick Wm. Foster, an architect, and in respect of a contract made between the plaintiff and the defendant for the carrying out of alterations and additions at Newton Hall, Harston, near Cambridge. Defendant alleged that the work was defective, and counterclaimed against the plaintiff for 10,000 damages.

Mr. Lewis Thomas, K.C., and Mr. G. R. Blanco White (instructed by Mr. V. Blanco White) appeared for the plaintiff; and Mr. Clavell Salter, K.C., and Mr. F. St. John Morrow (instructed by Messrs. Withers & Co.) represented the defendant.

Further evidence was given on behalf of the defendant's case by Mr. Frederick Arthur Ball, of the firm of Messrs. Ball & Son, quantity surveyors, of No. 6, King's Bench walk, Temple, and also by Mr. Walter Chas. Gibbs, a quantity surveyor, practising at Cambridge.

Mr. E. B. P'Anson, examined by Mr. St. John Morrow, said he was senior partner in the firm of E. P'Anson & Son, architects and surveyors. He had been in practice for upwards of forty years, was a Fellow of the Royal Institute of British Architects, also a Fellow of the Surveyors' Institution, architect to St. Bartholomew's Hospital, and to several other public bodies. He inspected the roof in question on June 30 and July 20 last. Dealing with the roof over the new wing, the witness said he did not think the work there was what was intended by the specification. It was done in a very rough manner, and, to his mind, there were several defects. To particularise some, he considered that the curbs were very shabby, and the gable joints seemed to be weak and had sagged. The rafters, in his opinion, should be bird-mouthed to the curb, and the work there was not in accordance with what was described on page 25 of the specification. He also noticed that the spacing of the ceiling joists was uneven. He considered that the rafters, where they joined the curb, were improperly butted. They were not bird-mouthed as he considered they ought to be. He thought that the curb seemed to have moved. Speaking of the quality of the timber in this roof, he should say it was not of the best, but of inferior quality. He also considered that the quality of the timber in the twin roof was not of the best quality. He saw some bad shakes in it. He also found that the rafters were short. It was sought to remedy that by putting pieces underneath. He considered that the general construction of the roof was very defective. He thought that the roof was a very poor specimen of carpenter's work. He noticed differences in the angles of the roof. He thought that the purlins were not properly bedded on the principal rafter. The common rafters ought to be notched on to the purlin and lie flat on it. The tie beam had not been properly wedged up to the king post. He was not with Mr. Murray when he took the

levels of the floors, but he (witness) had levels taken, and afterwards tested them with Mr. Murray. He also made some tests as to the spacing of the joists. He had seen Mr. Murray's plans as to the spacing of the joists. He knew that the contract provided that in no case should the joists be more than twelve inches apart. That had not been carried out. The witness also gave evidence detailing the extent of the various sags which had taken place in certain of the rooms, and generally agreed with the evidence given by Mr. Murray upon that point.

Cross-examined by Mr. Lewis Thomas.

During the time he had been in Court he had heard the prices the plaintiff had paid for the timber. Speaking as an architect, he did not think that the prices the plaintiff paid for the timber were the best prices. He agreed that Mr. Minter would probably know the proper prices to be paid for timber, and that he would not be likely to pay the best price without getting the best quality. He did not think that oak, properly seasoned, would develop shakes. He considered that the shakes he saw were more than surface shakes. You could easily distinguish sappy timber, even after it had been saturated with water. What he complained about the cement rendering was that the cement and the hair were not properly mixed. The hair was left exposed on the surface, and it was not work which he should have passed himself.

If it was left rough by the contractor on the direct instructions of the architect, can you complain about that?—Yes, in the way it was carried out.

Do you know that when the plaster was finished Mr. Foster said it was done exactly as he wanted it done?—No, I do not.

Cross-examination continued.

It was quite a common thing, when you had got sagged rafters, to put in solid strutting without disturbing the ceiling. Of course, it was a common thing to find a sagged ceiling in an old house; but one did not expect to find one in a modern one like Newton Hall. He did not know that Professor Waldstein wanted his ceilings in the old style, and in leather, and so on. He took it that the Professor did not want sagged ceilings, however. Great heat was bad for joinery. Speaking generally, he did not think it fair to have the temperature of a house kept at 84 degrees where there was new joinery; but he did not think it possible to keep a house up to that temperature in the winter.

Mr. Lewis Thomas: Fortunately, the temperature was taken by a thermometer.

Re-examined.

If joists were of equal size, the floor, which was made with the joists fixed close together, would be stronger than the floor would be if the joists were placed wider apart. Badly mixed plaster could fairly be described as being defective.

Mr. James Annan, examined by Mr. Salter, said he was a decorative plasterer, and his business in London and Edinburgh had existed for upwards of one hundred years. He had had forty years' experience himself in plastering work. He went down to Newton Hall last April for the purpose of examining the decorative ceilings. He also went there for the same purpose last Thursday. In April he made an examination of the enrichment of the hall ceiling. He found that the decorative work had started, and that there were two cracks across the rib within a foot of each other. Mr. Murray was afraid that the thing might fall, and asked witness to report upon the matter, and tie it up if necessary. Witness reported that in his opinion there was no immediate danger of the thing falling. He reported that, in his opinion, the work could not be satisfactorily put right without pulling down the rib and stripping and replastering the ceiling. He considered that the cause of the sinking of the ceiling was because the joists had sagged, and the nails which supported the rib had sprung. There were a number of decorative ceilings in the house. He should describe the workmanship of the ceilings as fair average work, but he would not describe it as the best workmanship. In his opinion, the cause of the trouble was the settlement of the building. It was not the fault of the plaster. He found, when he visited Newton Hall last Thursday, that the condition of the enrichment on the hall ceiling had got worse than it was when he saw it in April. That was what he expected.

At the close of the evidence on behalf of the defendant Mr. L. H. Stanborough, a quantity surveyor, practising in Bedford-row, W.C., gave rebutting evidence on behalf of the plaintiff as to the sum he alleged to be due to the plaintiff on the variation account, and also in answer to the criticisms of Mr. Ball, the quantity surveyor, who gave evidence on behalf of the defendant as to that account.

During the course of the cross-examination
LAW REPORT.—Continued on page 204.

List of Competitions, Contracts, etc.

For some Contracts still open, but not included in this List, see previous issues. Those with an asterisk (*) are advertised in this Number: Competitions, iv.; Contracts, iv. vi. viii. x.; Public Appointments, xvii.; Auction Sales, xxii.

Certain conditions beyond those given in the following information are imposed in some cases, such as: the advertisers do not bind themselves to accept the lowest or any tender; that a fair wages clause shall be observed; that no allowance will be made for tenders; and that deposits are returned on receipt of a bona-fide tender unless stated to the contrary.

The date given at the commencement of each paragraph is the latest date when the tender, or the names of those willing to submit tenders, may be sent in.

** It must be understood that the following paragraphs are printed as news, and not as advertisements; and that while every endeavour is made to ensure accuracy, we cannot be responsible for errors that may occur.

LAW REPORT—continued from page 201.

of the witness by Mr. Salter as to the items in the variation account, regarding the gardener's cottage, the witness stated that Professor Waldstein had sold the old material upon the site for an agreed sum to Mr. Minter.

That of itself would not justify Mr. Minter using old stuff as new?—Oh, yes, it would, if he had the architect's permission to use it.

Do you seriously suggest that because these old bricks had become the property of Mr. Minter by purchase, and he was granted permission to use them by the architect, that he was entitled to use these old bricks and be paid for them as though they were new bricks?

The witness replied in the affirmative, adding that they were exceptionally good bricks.

Were these bricks fifty or sixty years old?—I could not say what the exact age of them was, but I should say they would not be more than fifty years old.

If a builder buys old material, as old material, from a customer, and sells it back to the customer as new material, it would be a good thing for the builder?

The witness replied that he did not think that could be said in the present instance, because Mr. Minter had given a good price for the material.

Do you say that because a builder gives a good price for the material he is entitled to sell it back to you as new?

The witness replied that that was his opinion, when the old material was properly valued. In some cases old material might be really better than new. In the present instance the old bricks were exceptionally good.

Referring to the estimate by the witness of the sum due to Mr. Minter for the flooring in the coach-house, witness stated that he thought Mr. Minter was entitled to be paid that sum, having regard to the fact that the flooring in the coach-house was only a small item, and was outside the house altogether, and was not included in the contract. He had applied the same principle generally as to the lodges and outbuildings, as all these particular works were not contained in the principal specification and contract. He did not consider the contract itself applicable to the outbuildings, and his view was that Mr. Minter was not bound by the contract in respect of them.

The Official Referee: Then I suppose you will also say that Mr. Waldstein was not bound either?—Well, I looked at it, sir, in the way that if a man has something he is expected to pay for it.

Cross-examination continued.

In the work on the stables old material was all valued as new.

Referring to the range which Mr. Minter had put in in the stables, the witness stated that Mr. Minter was entitled to the cost of the range, his fair profit, and the cost of fixing.

Is he not obliged to show you what he gives for the range?—It is not necessary in a case like that. I dare say Mr. Minter has the invoice, and is prepared to show it to you.

At the conclusion of the evidence, Mr. Clavell Salter addressed the learned Official Referee on behalf of Professor Waldstein, dealing exhaustively and in great detail with all the points raised in the case.

The learned Council had not concluded his address when we went to press.

LONDON COUNCILS.

Barnes.—Plans have been passed as follows by the Urban District Council:—Additions, West Lodge, Morlake-road, Messrs. Boore & Parker; motor garage, 43, Madrid-road, Mr. A. Harvey; four houses, Melville-road, Mr. C. J. Kerven.

Bethnal Green.—Valuable work (says Dr. G. P. Bates, the Medical Officer of Health, in his annual report) has been carried out under Section 15 of the Housing and Town Planning Act, 1909. This section gives power to a local authority to deal with landlords who fail to keep houses of a gross rental not exceeding 40l. per annum in such a state as to be reasonably fit for human habitation. The powers previously enjoyed in this respect were incomplete. Fifteen notices, under Section 15 of the new Act, were served during the twelve months, and at the end of the year the requirements of twelve of these notices had been complied with, and in three the necessary works were in hand.

Westminster.—Dr. F. J. Allan, the Medical Officer of Health, in his annual report, refers to the fact that as regards drainage, etc., proceedings were taken in only one case during the year, when a fine of 10s. and 23s. costs was imposed for carrying out drainage works in an improper manner. Legal proceedings in connexion with water supply were taken

in six cases. Additional sources of water supply on the upper floors of tenement houses were provided in 1,049 instances. As a rule the Council has not asked for more than one tap between the first and second floors, but the owners in some cases laid on water to each floor. Several owners of property, as a result in the alteration in the method of charging for water, sunk wells. Analyses of the water obtained had been made, and there are curious variations in the water raised in different localities. Water, which is extremely soft, has a tendency at first to act on lead pipes, but after a time they become coated with a protective "skin." Analyses taken some time after the wells had been in use showed that the waters contained no lead. Complaints had occasionally been made by consumers of a white deposit of the salts in the water. The great increase of these deep wells in recent years must have a marked effect upon the underground water in the chalk under London, and as the level sinks, such wells will have to be sunk deeper. The rate at which the level is falling has been estimated at from two to three feet a year, and eventually it may not pay to sink wells to the depth necessary to obtain a supply; possibly, moreover, the quantity of water in this underground reservoir is not inexhaustible. The excavations in connexion with the new St. Anne's Parish Hall, in Dean-street, led to the discovery of the pavement of a well 73 feet deep, containing 57 feet of water. This was the source of supply of the old parish pump, which stood in front of the Vestry Hall. Its use was discontinued in 1866, at the time of the cholera visitation, as it was found that many of the shallow wells were contaminated by seepage from cesspools, and thus became a means of spreading the disease.

OBITUARY.

Josef Israels.

The famous Dutch artist, Josef Israels, who died at The Hague a few days ago, was born at Groningen on January 27, 1824. After leaving school his father took him into his employ, that of a money changer, but observing his talent for drawing, decided to allow his son to follow an artistic career. He placed him at first under two local artists, Bujs and van Wicheren, and then sent him to Amsterdam, where he studied under Jan Kruseman. In 1845 he proceeded to Paris, studying under Picot, and at the Ecole des Beaux Arts. He returned to Holland in 1870, but his first artistic venture, a series of historical pictures, proved a failure. His defeat, coupled with the privations he had been forced to undergo in his student days, brought on an illness which necessitated a stay at the seaside. He went to Zandvoort, near Haarlem, and devoted himself to depicting the everyday life of the fisher folk of the district. With these paintings he rapidly acquired a reputation which has since never waned. He received in the course of his career many distinctions. He earned several medals at Paris exhibitions, was an Officer of the Legion of Honour, a Commander of the Order of the Lion of the Netherlands, and received the Cross of the Belgian Order of Leopold. On his 80th birthday some of his English admirers presented him with 20,000 guilder, which he devoted to the fund raised in Holland to provide a suitable repository for Rembrandt's "Night Watch." In 1906 he was elected a corresponding member of the Royal Academy. The distinguishing feature of his work was the intimate and complete harmony between his technique and the spirit of his conceptions, probably in the works of no other modern painter, save Jean Francois Millet, does the technical mode of presenting the conception go so far towards enhancing the impression created.

PATENTS.

APPLICATIONS PUBLISHED.

18,329 of 1910.—Colin Henry Adams: Ratchet tool for use as a spanner, drill, or lifting jack.

19,299 of 1910.—Mary Ewart Cambell, Walter Cambell, and Alexander Pryde: Building blocks.

21,601 of 1910.—Edgar Newton: Means for connecting the water supply and fixing in position of bends, sockets, unions, or waste pipes to sinks, baths, basins, and the like.

22,301 of 1910.—William Edward Lake (Thomas R. Beggs, Faucet and Valve Company): Faucets and valves.

* All these applications are in the stage in which opposition to the grant of Patents upon them can be made.

22,519 of 1910.—Friedrich Schofer: Manufacture of tubular and like sections of chimneys.

23,212 of 1910.—Reuben John Edgington: Sliding window-sashes.

24,321 of 1910.—Michael Power: Window-blind fittings.

24,565 of 1910.—Thomas Sanders: Casement fasteners and the like.

27,038 of 1910.—Samuel Henry Adams: Mahole covers, surface boxes, gully grate frame and the like.

27,494 of 1910.—David Howells: Method of utilising waste material for the manufacture of concrete and like articles.

SOME RECENT SALES OF PROPERTY

ESTATE EXCHANGE REPORT.

August 1.—By SEDGWICK, SON, & WEALL.

Leavesden, Herts.—Six cottages and smithy, f. 43

Shape, Suffolk.—Freehold farms, etc., 675 acres 7 4

August 2.—By MADDISON, MITER, & MADDISON.

Hickling, Norfolk.—Arable land, 38 acres, f. 8

By MORRIS, MARSHALL, & POOLE.

Bishops Castle, Salop.—Whitewash and Old- 8 0

de Lays Farms, 245 acres, f. 8 0

August 3.—By S. WALKER & SON.

Coulston, Surrey.—8 to 14, Mount Pleasant 1 8

Hookey, Surrey.—3 to 8, Hookey Villas, f. 9

w.r. 132l. 12s.

August 4.—By GILBERT & SON.

Carno, Montigny.—Agricultural estate, 1,550 acres, f. 13 5

Contractions used in these lists.—F.g.r. for freehold ground-rent; l.g.r. for leasehold ground-rent; i.g.r. for improved ground-rent; g.r. for ground-rent; r. for rent; f. for freehold; c. for copyhold; l. for leasehold; p. for possession; e.r. for estimated rental; w.r. for weekly rental; q.r. for quarterly rental; y.r. for yearly rental; u.r. for unexpired term; p.a. for per annum; y.f. for years; h. for half; st. for street; rd. for road; sq. ft. for square; pl. for place; ter. for terrace; cres. for crescent; av. for avenue; gds. for gardens; yd. for yard; gr. for grove; h.h. for hearthstone; p.h. for public-house; o. for office; s. for shops; et. for court.

TERMS OF SUBSCRIPTION.

"THE BUILDER" (Published Weekly) is supplied DIRECT from the Office to residences in any part of the United Kingdom at the prepaid rate of 18s. per annum, with delivery by *Express* to *Morning's Post* in London and its suburbs. *Foreign* subscriptions, to all parts of Europe, America, Australia, New Zealand, India, China, Ceylon, etc., 25s. per annum. Remittances (payable to J. MORGAN) should be addressed to the Publisher of "THE BUILDER," 4, Catherine-street, W.C.

PRICES CURRENT OF MATERIALS.

* * * Our aim in this list is to give, as far as possible, the average prices of materials, not necessarily the lowest quality and quantity obviously affect prices—a fact which should be remembered by those who make use of this information.
